A NEW AND COMPLETE
D I C T I O N A R Y
O F
TRADE and COMMERCE:

CONTAINING
A Distinct EXPLANATION of the
GENERAL PRINCIPLES OF COMMERCE;
An ACCURATE DEFINITION of its TERMS;

A N
Ample ILLUSTRATION of the LAWS and CUSTOMS of all Commercial States, with
respect to MERCANTILE AFFAIRS, in general; including the several TREATIES of
COMMERCE actually subsisting at this Time between the different Powers of EUROPE.

A Particular DESCRIPTION of the different
PRODUCTIONS OF ART AND NATURE,
Which are the BASIS and SUPPORT of COMMERCE;

Particularly distinguishing the
Growth, Product, and Manufactures of GREAT BRITAIN and its Colonies.

A N
Exact Specification and Valuation of all FOREIGN COINS, with Easy Concise TABLES for reducing
them to the BRITISH STANDARD. An Historical and Critical Account of all Public and Private
COMPANIES, and of all Public BANKS and FUNDS, with the Nature of their Securities. An
Abstract of the BYE-LAWS and CUSTOMS of all Ports and Harbours; with a Description of the
OFFICE and DUTY of CONSULS, AGENTS, and other Persons residing in Foreign Parts, for the
Protection of the Commerce of their respective Nations.

A L S O
Observations on the PRESENT STATE of our FOREIGN COMMERCE, and of the
NEW MANUFACTURES established and brought to Perfection of late Years in GREAT BRITAIN,
of which no Account has hitherto been given in any other Commercial Dictionary.

By T H O M A S M O R T I M E R, Esq;
His Majesty's VICE-CONSUL for the AUSTRIAN NETHERLANDS.

L O N D O N : Printed for the AUTHOR ;

And sold by S. CROWDER, at the Looking-Glass; and J. COOTE, at the King's Arms, in Pater-noster-row ;
and J. FLETCHER, in St. Paul's Church-yard.

ADVERTISEMENT.

AMIDST the great variety of Literary Productions continually presented to the Public, very few seem calculated for General Utility; and when we are favoured occasionally with any works of this class, the Expence of the purchase in a great measure defeats the design; for no performance can prove Extensively useful, unless it be published on such terms as are best calculated to promote Universal Circulation.

In this point of view, the method of publishing useful works in periodical Numbers, at an easy price, seems justly to claim the preference beyond all others: by this means, those who stand most in need of information, procure it at a cheap rate; and Knowledge is not confined to the studies of the Rich and Affluent alone, but is universally diffused among men of every rank and station: from hence an evident advantage arises to the community, which is but little attended to: the leisure hours of the Tradesman, Manufacturer, and Mechanic, being thus employed, and a small portion of his honest gains thus bestowed, he is diverted from scenes of idle, if not of criminal, dissipation, and his mind at the same time being improved by the acquisition of useful information, his manners become refined, his ideas more enlarged, and, in a word, he is made a better man and a more useful citizen. But it must be acknowledged, at the same time, that the general Taste of Reading which at present prevails in these kingdoms, may prove equally pernicious to society, if it is not directed into a proper channel; for while the press furnishes us only with books of amusement, such as Romances, Novels, Memoirs, and Plays, or that these are sought after and purchased with avidity; while such as convey real Improvement and Instruction are neglected and discountenanced, it is to be feared the cause of Vice and Immorality will rather be promoted than discouraged by our frequent publications.

COMMERCE, it must be allowed, is a Science from whence we derive the greatest honour and advantage: "If we consider (says Mr. Addison) our own country in its natural Prospect, without any of the benefits and advantages of COMMERCE, what a barren uncomfortable spot of earth falls to our share! Traffick has not only enriched our Vegetable World, but it has improved the whole Face of Nature among us. Our Ships are laden with the Harvest of every Climate; our Tables are stored with Spices, and Oils, and Wines; our Rooms are filled with pyramids of China, and adorned with the Workmanship of Japan. Nature, indeed, furnishes us with the bare necessities of Life; but TRAFFICK gives us a great Variety of what is Useful, and at the same time presents us with every thing that is Convenient and Ornamental. For these reasons, there are not more useful members in a commonwealth than Merchants; they knit mankind together in a mutual intercourse of Good Offices, distribute the Gifts of Nature, find Work for the Poor, add Wealth to the Rich, and Magnificence to the Great."

In a free Commercial State, where the body of the nation consists of Merchants, Artists, Manufacturers, Tradesmen, and Artificers, such books as treat of the Polite and Useful Arts, of the Fabricating of sundry Manufactures, and of the Nature, Extent, and Benefit of Commerce, with the most advantageous methods of conducting it, deservedly claim the preference, and merit the first attention of the Public; yet a mere cursory perusal of our modern catalogues of books, will convince us how deficient we are in works of this class, which in foreign countries are to be found in great abundance. Some excellent performances have, indeed, appeared on subjects relative to the Arts and Sciences; but with respect to COMMERCE in particular, we have no compilation in our language, which merits the name of a COMPLETE TREATISE on that important subject. This induced me, some years since, to undertake the present work, which was afterwards laid aside to give place to a New History of England; which having happily met with the most favourable encouragement, I have now ventured to resume the Commercial Work, as no improper Companion to the History of England; and I have chosen the same method of publication, that persons of every station might be enabled to purchase a work, which I flatter myself will prove as Entertaining, and at the same time as extensively Useful, as the History.

A D V E R T I S E M E N T.

I have selected the whole from the best ancient and modern authors; and as a great number of Commercial Treatises have been published, especially in the French language, since the publication of the only two Dictionaries on Trade and Commerce now extant in our language; and the State of our Foreign Commerce is greatly altered and improved, and our Possessions in America considerably enlarged; I have added such an ample account of the Present State of Commerce, both at Home and in the Colonies, as will render this work more Correct and Instructive than those hitherto published, provided the Execution shall appear equal to the Plan: and of this the candid reader will be the most impartial judge.

I have preferred the form of a Dictionary, on account of the Ease of referring for immediate information; for I consider, that I am writing chiefly for the use of the Sons of Industry, who have but little leisure to bestow on reading, and who, perhaps, in the very course of their business, may have occasion instantaneously to refer for information to some particular article, when they have no time to attend any other part of the subject; for the same reason, I have carefully avoided all tedious digressions and dissertations that are foreign to the subject, and which form the chief defect of Postlethwayt's Dictionary on Trade and Commerce, translated from the French of Monf. Savary. On examining the following articles in that Dictionary, viz. BREAD, BREWER, CARDS, &c. I found whole pages taken up with details of the Bye-laws, &c. of the private companies of Bakers, Brewers, Card-makers, &c. of the city of Paris, which cannot convey any Instruction to the English reader, and are by no means connected with the subject in general.

From the variety of treatises published in foreign countries on Commercial Subjects, their youth are very early masters of the Principles of Commerce in general, which are not to be learned by serving an apprenticeship to any particular trade; and in Holland in particular, where every thing relative to the interests of Commerce, is duly attended to, every little piece that appears in France, or any other country, on this subject, is immediately procured at any expence, and is to be found in the houses of the Dutch Merchants and Shopkeepers; whilst books of mere entertainment scarce ever find admittance: hence a general knowledge of trade is universally diffused, and carried into practice; and while our Tradesmen know little more than the particular branch of business in which they have been brought up, and are ignorant of almost all other commodities but those which form the immediate objects of their particular traffick; Foreign Merchants, and even Shopkeepers, have a more general knowledge, and may be called a sort of General Merchants, being qualified for transacting various branches of commerce.

To remedy this defect with us, which perhaps is one reason why our very great Commercial Affairs are confined to so few hands, and Monopolies daily increase, this NEW and COMPLETE DICTIONARY of TRADE and COMMERCE is humbly offered to the Public; and the Author hopes that many years Experience in Commercial Affairs, joined to an extensive Acquaintance with British and Foreign Merchants, from whom he has received great Assistance in this Undertaking, has enabled him to execute it in such a manner as will give general satisfaction: and he has only to add, that the substance of every performance of reputation already in print on the subject, is carefully selected, and accurately inserted in this work; and that no article shall be omitted or abridged, which may in the smallest degree contribute to the attainment of a perfect Knowledge of every Circumstance relative to those grand objects of National and Private Concern.

DICTIONARY

O F

TRADE and COMMERCE.

A

A, The character or figure of the first letter of the alphabet, in Latin, English, French, and almost all the languages of Europe.

A, was a numeral letter among the ancients. Baro-
nius cites the technical verses that were expressive of the
value of each letter of the alphabet. This verse,

Possidet A numeros quingentos ordine recto,
specifies that the letter A signified five hundred; sur-
mounted with a dash or strait line, thus ($\overline{A}$), it signified
five thousand.

The ancients, properly so called, made no use of those
numerals, as it is commonly believed. Isidore of Seville,
who lived in the seventh century, assures us expressly
of the contrary; *Latini autem numeros ad litteras non com-
putant*. This custom was not introduced but in the
times of ignorance. M. Ducange, in his Glossary, ex-
plains at the beginning of every letter what that custom
was, and most lexicographers have copied without un-
derstanding him; for they all agree in saying, that the
explanation of that custom is found in Valerius Probus:
whereas Ducange only said it was found in a collection
of grammarians, amongst whom was Valerius Probus.
*Habetur verò illud cum Valerio Probo . . . & aliis qui de
numeri scripserunt editum inter grammaticos antiquos*. The
Hebrews and Arabs made use of their *aleph*, and the
Greeks of their *alpha*, which answers to our A, for
signifying the number 1. and in the Scripture-language
alpha denotes the beginning and principle of all things:
I am Alpha, &c.

A, *numismatic or monetary*, on the reverse of the an-
cient Greek medals, signifies that they were struck in
the city of Argos, and sometimes in that of Athens.
In the consular medals, this letter denotes likewise the
place of fabrication; in those of the emperors, it com-
monly signifies *Augustus*. On the reverse of the medals
of the lower empire, which were in reality current coins,
and as such used by the people, A is the mark either of
the city, as Antioch, Arles, Aquileia, where there were
mints; or imports the name of the master or warden of
the mint. In the French gold and silver coins, this letter
is the mark of the money of Paris; and the double AA
that of Metz.

I.

A

A, *lapidary*, in the ancient inscriptions on marble, &c.
signified *Augustus*, *ager*, *aiunt*, &c. according to the sense
required by the rest of the inscription. When double,
it signifies *Augusti*; triple, *auro*, *argento*, *ære*. Isidore
says, that when found after the word *miles*, it signifies
that the soldier was a young man. We find in some in-
scriptions explained by able antiquaries A rendered by
ante, and according to them, those two letters AD are
equivalent to the words *ante diem*.

A, in modern writers, imports the year, as A. D.
anno Domini, the year of our Lord.

A, in the Julian Calendar, is the first of the seven
dominical letters. The Romans made use of them long
before the time of Christ: this letter was the first of the
eight nundinal letters; and it was in imitation of this
custom that the dominical letters were introduced.

A, is an abbreviation used in different arts and for diffe-
rent purposes. See ABBREVIATION.

AAA, among chemists, signifies an amalgama, or
the operation of amalgamating. See AMALGAMA and
AMALGAMATION.

A, $\bar{a}$, or $\bar{a} \bar{a}$; this abbreviation is used in medicine
for *ana*, indicating an equal quantity of each different
ingredient prescribed in the receipt. Thus $\mathcal{U}$ *thuris*,
myrrhæ, *aluminis* $\bar{a}$ $\mathfrak{H}$ j, is the same thing as $\mathcal{U}$ *thuris*,
myrrhæ, *aluminis*, *ana* $\mathfrak{H}$ j. In both examples $\bar{a}$, $\bar{a} \bar{a}$ and
ana, signify equal parts of each ingredient. $\mathcal{U}$ means,
take of frankincense, myrrh, alum, of each one scruple.
This signification of *ana* has not its origin in the fancy of
the first physician who adopted it; for the proposition
 $\bar{\alpha}\nu\alpha$ among the Greeks was taken in the same sense it
now is by the authors of medicine. Hippocrates, in his
treatise of the diseases of women, after speaking of a
peffary, which he recommends as proper for conception,
and after specifying the drugs, adds $\bar{\alpha}\nu\alpha$ $\bar{\epsilon}\lambda\theta\omicron\lambda\omicron\nu$ $\bar{\epsilon}\kappa\acute{\alpha}\sigma\tau\omicron\nu$, that
is, of each one drachm. See ANA.

A. merchants, traders, bankers, and book-keepers, make
use of this letter, either alone, or followed by some other
initial letters, for abridging ways of speaking frequent in
trade, and for saving time and room in their journals,
books of accounts, or other registers. Thus, among the
French, A alone, after mentioning a bill of exchange,

B

signifies

signifies *accepted*. A. S. P. signifies, *accepté sous protest*; accepted under protest. A. S. P. C. *accepté sous protest, pour mettre à compte*; accepted under protest, to be placed to account. A. P. signifies to protest.

Merchants commonly distinguish their sets of accounts by the letters A, B, C, &c. which answer the end of No 1, 2, 3, &c. in order to refer by these letters, from new sets of books to the old, or to certain articles which they may have an occasion to review.

AABAM, some alchymists have made use of this word to signify lead. See LEAD.

AAGGI-DOGGI, a Persian word, signifying *The Bitter Mountain*, which is so called on account of its being a very dangerous passage for the caravans, which travel into Persia from Constantinople to Ispahan. It is situated a day's journey from Louri, on the frontiers of Persia, near Chaouqueu. When the caravans are arrived at the pass of this mountain, all the camels and horses are numbered, for each of which the caravan-bachi takes a duty, which he employs partly for the pay of the soldiers that guard the caravans, and partly for other small charges; but he reserves the greatest part for himself. See CARAVAN.

AAM, a measure for liquids, used at Amsterdam, containing about sixty-three pounds, avoirdupoise weight.

ABACA. It does not appear that naturalists know exactly what it is. M. Savary says, in his Dictionary of Commerce, that it is a sort of hemp or flax, prepared from an Indian plantane, which is white or grey. The white is manufactured into very fine cloth; but the grey is used only for cordage and cables.

ABACO. Some ancient authors use this word to signify *arithmetic*. The Italians also use it in the same sense.

ABACUS, amongst ancient mathematicians, signified a small table covered with dust, on which they traced their plans and figures, according to the testimony of Martius Capella, and Persius, *sat. i. v. 131*.

*Nec qui abaco numeros et fasces in pulvere metas
Scit rixisse vaser.*

ABACUS *Pythagoricus*, or the table of Pythagoras, was a table of numbers for the more easy learning of the principles of arithmetic. It is probable this was nothing more than our table of multiplication. Ludolphus lays down rules for multiplication, without the help of the *abacus*; but they are too long and difficult to be made use of in the ordinary operations.

ABACUS, also among the ancients, signified a kind of cupboard or buffet destined for several uses. In a merchant's counting-house it served as a writing-desk; and in a dining-room it held the plate, drinking-cups, and like utensils. It was usually of marble, as appears by this passage of Horace:

*Et lapis albus
Pocula cum cyatho duo sustinet.*

The Italians have called this piece of furniture *credenza*. The word *abacus* latinized is of Greek origin. Abacus further signified a panier, basket, chapter of a pillar, basis of a rock, mountain, the diameter of the sun, &c.

The ABACUS used for accounts and calculations, was a kind of long frame divided by several parallel brass-wires, each passing through an equal quantity of ivory globules, or small balls of wood moveable, as the grains of beads, by the disposition of which, and according to the relation the lowermost bore to the uppermost, the numbers were distributed into different classes, and all sorts of calculations performed. This arithmetical table, in use among the Greeks, was not unknown to the Romans. It is found described from some ancient monuments by Fulvius Urfinus and Ciaconius; but as the use of it was somewhat difficult and embarrassing, that of counters prevailed. In China, and some other parts of Asia, merchants and dealers still reckon by small ivory or ebony-balls, a brass wire being run through them; and they commonly wear this string of beads hanging from their belts or girdles. The Chinese also, according to Le Comte, have for the purposes of calculating, an *abacus* or table, consisting of an oblong board, about eighteen inches in length, on which are fastened obliquely a certain number of brass wires, strung with a quantity of ivory or wooden beads of different sizes. By an arrangement of these, known

only to themselves, and by following the rule of proportion, which the beads of a superior rank bear to the inferior, they calculate with such readiness and exactness, that they can keep pace with the most expert accountant, while he is casting up any account in a regular book.

ABACUS. The great *abacus* is likewise a kind of trough made use of in mines for washing gold.

ABADA, is said to be an animal found on the south-coast of Bengal, with two horns, the one on the forehead, the other on the nape of the neck. It is much about the size of a foal of two years old, has the tail of an ox, but not so long; the mane and head of a horse, but the mane thicker and coarser, and the head flatter and shorter; and the feet of a stag, cloven, but larger. The horn in the forehead is three or four feet in length, slender, about the thickness of a man's leg towards the root; sharp at the point, and strait in the animal's youth-age, but afterwards bending forwards: the horn on the nape of the neck is shorter and flatter. The inhabitants of this country kill it for the sake of its horns, which they hold to be a specific, not in several diseases, as we read in some authors, but in general against poisons and the bites of venomous animals. It would be rashness in us, after such a description, to doubt of the *abada's* being a real animal; but it remains to be known whether mention is made of it in some well informed and accurate modern naturalist, or whether perhaps all this has no other foundation than the testimony of some traveller. See Vallisneri, *tom. iii. p. 367*.

ABAST, in the sea-language, denotes the stern, or hinder part of a ship or vessel, called also *ast*. The stern, strictly speaking, is only the outside; *abast* includes both inside and out.

ABASIR. Some alchymists have made use of this word to signify *spodium*.

ABALIENATION, in the Roman law, signifies a sort of alienation, whereby the effects called *res mancipi* were transferred to persons, who had a right to them, either by a formula called *traditio nexu*, or by a renunciation made in presence of the court. This word is composed of *ab* and *alienare*. The effects called *res mancipi*, and the object of the alienation, were cattle, slaves, lands, and other possessions within the bounds of the territories of Italy. Those who had a right of acquiring them were Roman citizens, the Latins, and some foreigners, who were allowed this commerce by special licence. The transaction was performed, either with the ceremony of weights, and money in hand; or by a renunciation, in presence of a magistrate.

ABANDONED, in the civil law, is said of goods, which the proprietor has renounced knowingly and willingly, and which he no longer reckons in the number of his effects. This term is also applied to lands, which the sea has retired from and left dry, and which may be in a state of cultivation.

ABANDONING, in the civil law, is the voluntary or forcible relinquishing the goods one is possessed of. If to creditors, it is called *cessio*; if they are abandoned to be free from the charges to which one is subject by possessing them, it is called *giving up*. A man, by the act of *abandoning*, or *giving up* all his effects, is deemed free from the pursuit of his creditors, so as that they can form no pretensions to whatever he may afterwards acquire.

ABAREMO-TEMO, a tree which grows, it is said, in the mountains of Brazil. Its roots are of a deep red, and its bark of an ash-colour, bitter to the taste, and yielding a decoction fit for deterring inveterate ulcers. Its substance has the same property.

ABARI, *Abaro*, *Abarum*, a great tree of Ethiopia, that bears a fruit like a pompon.

ABAS, a weight used in Persia for pearls. It weighs three grains and a half, but somewhat less than those of avoirdupoise weight.

ABASSI, a Persian silver coin. Schah-Abas II. ordered the coining of silver pieces, called *abaafi*. The legend is relative to the Mahommedan profession of faith in the Alcoran, and the stamp or impression to that king's name and the city where it was struck. An *abassi* is worth two *inamoudis*, or four *chayes*; the *chaye* is worth somewhat more than 2d. $\frac{1}{2}$ sterling, and thus the *abassi*

abassi may be nearly of the same value with our shilling. There are double *abassi*, triple, and quadruple; but the last are rare. The *abassi*'s being subject to be adulterated, it is good to weigh them; and therefore the payments in this coin are made by weight, and not by the number of pieces.

ABASSON, the first kingdom on the African coast westward, from the cape of Sierra Lione to the river of Ardres, extends only about six or seven leagues along shore, though its bigness within land is unknown. On sailing eastward, the villages and little states of Albiani and Tabo are met with; the first six leagues from Issini, and the other ten. The ships that trade along the coast come to an anchor before those villages, and hoist their colours, on which the negroes immediately come off, and on finding them friends, go aboard, where they are commonly regaled with a glass or two of brandy, and an enquiry is made from them, whether any ships have been lately on the coast, and what goods they have got to dispose of.

ABAT CHAUVÉE, a sort of wool of subaltern quality, so called in Angoumois, Xaintonge, la Marche, and Limosin, in France.

ABATELEMENT, a term of trade used by the French in the ports of the Levant. It signifies a sentence of the consul debarring all merchants and dealers of the French nation from carrying on any trade, who disavow their bargains, or refuse to pay their debts. This interdict is so rigorous, that those against whom it is pronounced are not even allowed to bring any action for the payment of their debts, till they have made adequate satisfaction, according to the consul's judgment, and taken off the *abatement*, by paying and executing its injunctions.

ABATEMENT, otherwise *Rebate*, is a term in use among traders, for a discount or abatement in the price of certain commodities, when the buyer advances the sum directly, for which he might have taken time. As traders are not always inclined to pay ready money, an abatement or deduction of so much per cent. per annum, has been devised to induce them to it, that they may take the advantage of the customary discount. It is also the practice of several great trading companies in foreign countries, to allow discount for payment of ready money; and of that of the English East-India Company in particular, to allow 6 per cent to the buyer for prompt payment, as it is termed.

It sometimes likewise happens, that goods, upon delivery at the Custom-house, are found to have received damage. In this case, the surveyor and landwaiter are to make their report on the back of the warrant, and return it to the collector and principal officers; who are then to chuse two indifferent and experienced merchants to view the goods, and upon oath to determine the quantum of the damage. Then the surveyor and landwaiter certify, that the goods viewed by the merchants are the same for which duty was paid: whereupon a certificate of the whole proceeding is made out, and a proportional abatement of the duty is made, and repaid to the merchant, upon his signing the receipt. *See* SURVEYOR, LANDWAITER, CERTIFICATE, DRAWBACK.

ABESH and ANIAN, a part of Ethiopia, so called, is bounded by Egypt and Abyssinia towards the north and west; by the Red Sea and the Eastern Ocean on the east; and by Zanguebar on the south, and extends from the fifth degree of north latitude to the twentieth. *Anian* lies upon, or near the Eastern Ocean, and the Red Sea. The Portuguese and other Europeans, who have visited it of late years, assure us, it is a perfect desert from latitude 5 to the Straits of Babelmandel, and even within those straits for several miles. The Turks are masters of the coast of *Abesh* to the northward of *Anian*, and in the principal ports, Sunquem and Arquico, about 150 miles distant from each other, keep strong garrisons, which command the country, a fruitful tract of ground, populous, and abounding with plenty of most things.

ABB. The yarn of a weaver's warp is so called by the clothiers; they also say *abb-wool* in the same sense.

ABBEVILLE, a large town in Picardy, about ninety miles, north of Paris, and fifteen east of the British Channel, is celebrated for a manufacture of fine broad cloth, which

Lewis XIV. first established, and which he did by advancing 40,000 livres to Mynheer Van Robais, a Dutchman. The king also erected for him a spacious and commodious place for carrying on this manufactory, with an elegant house to live in; and besides, granted him a patent for the sole making of superfine broad cloths in that part of France. And, as Mynheer was a protestant, the French king granted him a farther patent, renewable every twenty years, for the free exercise of the protestant religion, for himself and family, and all the people that did then; or should hereafter, work in any branch of the woollen fabrics at this town. Also, that if any woman, who was a Roman catholic, should marry a protestant that belonged to this manufactory, she should have it in her option to turn protestant or not. And, in order at once effectually to establish this manufactory, the king himself wore some of the first cloth that was made, and ordered all his court to do the same.—All these privileges are maintained to this day inviolably, and the manufactory is now carried on by three partners, who are nephews to old Van Robais, and of the same name: nothing is here manufactured but superfine broad cloth, wherein, it is asserted, no wool is used but Spanish. The place lies close to a navigable river, not far from St. Valery, a small sea-port town; and they carry on in it every branch of this superfine manufacture, except the fulling of the cloth, and the spinning of the wool.

There are 108 broad looms, and about 600 men, women, and children, employed upon the spot, in picking of wool, winding, warping, weaving, shearing, rowing, dying, burling, scribbling, fine-drawing, pressing, packing, &c. All employed are governed with extreme decorum and regularity. They all come to work, and leave it at the beat of a drum. If any workman gets fuddled, or is guilty of any offence, he is suspended his work by the foreman of the branch to which he belongs, during pleasure, but not exceeding a month's time; for every branch of the business, it must be observed, is under the conduct of a distinct foreman, who so disciplines the workmen as to make them excel in every branch of the whole; which management is worthy of notice.

One Cole, that went from London, was the first person that taught them to dye proper colours, and to make mixtures of wool, as we do in England. This manufacture hath so enriched the Van Robais's family, that, upon public days, they appear in their coach and six horses, with half a dozen splendid valets to attend them, as grandly as any of the peers in France. Though no English wool is used in this superfine manufacture, if we are rightly informed, yet there is a large quantity used in the town of Abbeville; for this fabric, being crowned with such great success, induced other people to fall into the way of making other different sorts of stuff, as paragons, serge-royal, druggets, shalloons, cloth-serge, &c. which are chiefly made of English and Irish wool alone. There are not less than 1000 looms going in this town on paragons, besides a great many more employed in the making of druggets, serge, cloth-serge, &c. Those goods are chiefly sent to Spain, Portugal, and Italy, and most of them are absolutely sold for English woollen manufactures, as being *façon d'Angleterre*. "I have been told (says an eminent English woollen manufacturer of Northamptonshire, who took a tour to France, to see the progress of the woollen fabrics in that kingdom, and who published not long since an account of them) by a manufacturer of the town of Abbeville, that he hath known an English ship lie in St. Valery road (the port before mentioned) while they have sent a boat up to Abbeville, which is near four leagues, to fetch down bales of woollen manufactures, and have shipped them on board the English vessel, and carried them to foreign markets for English goods, the bales being marked and numbered, as if marked in England, and they were sold amongst our English goods."

It is very much to be feared, that this is too common a case, and has been an artifice of many years standing, to impose these French woollen manufactures, made *façon d'Angleterre*, upon foreign nations for English; and those too which have not been so good in quality may have been complained of by foreigners, and highly prejudiced the reputation

putation of our manufactures in that respect also.—Nor could a more superlative trick be contrived than this, in what light soever it may be taken, for the absolute ruin of our woollen manufactures, and the establishment of the French; and such Englishmen, or Britons, who are either merchants or masters of ships, that will be thus concerned in a conspiracy of such destructive consequence to the whole woollen manufactory of this kingdom, deserve the gibbet more meritoriously than any criminal, perhaps, that was ever exalted to it.”

And if this, upon due enquiry, should be found to be a very common practice, it may deserve the consideration of the legislature of the nation.

“But if I had the favour to know one of these gentlemen, continues the honest manufacturer before quoted, and should ask why he thus buys French goods, and ships them with our goods to be carried to foreign markets, I know it will be given for answer, That they can buy paragon, druggets, &c. cheaper at Abbeville than in England, which I know to be true. And the reason that goods are to be bought cheaper in France than in England is, because the labour is above one third cheaper than in England, where the same sorts of goods are made; for there the poor people work hard, and fare hard, as to their food and clothing.

“There is another pretty large manufacture carried on in this town, by four partners, two Dutch, and two Frenchmen; the Dutchman's name is Schalone, whose father was Van Robais's first foreman. This fabric is attended with good success: the sort of goods they make are serge-royals, druggets, and some few shalloons and cloth-serge; these goods are made mostly with English and Irish wool: they have several workshops in the town; they carried me to one of the comb-shops, where there were seven or eight men at work upon English and Irish wool; I combed a combful of it myself: they also shewed me their stock of wool, yarn, worsted, and other goods wrought up, which was very large; I believe there was at least 10,000*l.* stock, wrought and unwrought; I brought several of their patterns away with me, some serge and some druggets; the serge is the finest I ever saw: I shewed them to some of the best judges of serge in England, who declared that they had never seen any like them, for fineness and beauty, made in England. I mentioned before, that Van Robais had a patent for the sole making of superfine broad cloth, with other advantages; one of which was, that no person in that place shall use, or occupy, any fulling-mill, that goeth either by wind or water: so that when this factory was set up by the Schalones, they were obliged to have a mill to go with horses, which they call a gill-mill, and is one of the best contrivances that I ever saw for that purpose; for it fulls the goods to perfection.

“The last time I was at Abbeville, I observed that these four partners had advanced their trade; and one of the Schalones told me, that they had goods, then in Italy and Messina, but were obliged to take off the town mark before they sent them abroad, and so ship them on board some English vessel; this he said they did, because there was a large duty on French woollen goods in those parts, even almost to a prohibition; and that they could not therefore send any goods thither, but under the notion of English manufactures. The English, however, being kind neighbours, did the French that piece of service, to carry their goods for them to other markets, where the French could not go themselves: these are true Britons to be sure, and have a great value for their native country.”

Such is the seeming honesty and simplicity of this our woollen manufacturer's account, that we judge it most acceptable to continue his narrative in his own words:

“At the same time, continues he, I was at another merchant's house, where they were all hands at work, in packing woollen manufactures to be shipped on board an English ship that they expected every day to come into St. Valery road; this the master told me, and I saw the goods they were a packing: there were a great many bales, all marked with English marks and numbers. I also saw some Irish worsted at Messrs. Schalone's, that they had got to make shalloons with; I brought two skeins of it away along with me. The price of English

and Irish combing wool, was about 10*d.* English money, a pound; and some that was deep and a fine long staple, was 10*d.* $\frac{1}{2}$ per pound. Of late years they have got the way of making good hose at this town in frames, which they chiefly consume amongst themselves: I do not doubt but, in a short time, this branch will also find its way to foreign markets, along with the other goods, if they continue to have our wool: as to their method of mixing and managing of our wool with their own, it is as follows; in the finest serge, druggets, &c. they put none of their own country wool; but, in the second sort of goods, they mix one third of theirs, with two thirds of ours; and in proportion, as they would have their goods coarser or finer; for in some goods they mix two thirds of their own, with a third of our wool; for, with their own wool alone, they can only make coarse cloths, cloth-serge, hats, hose, &c. for the poor people of their own country. I was told by a manufacturer of this town, that he had received advice, that there was forty or fifty thousand weight of my country wool landed at Nantz, and that he was to have part of it. And, as near as I could learn, there are about 300 wool-combers in this town, and a great deal of the wool, combed here, is sent to Amiens, to be spun into small yarn or worsted, it being the best place in this country for good spinning.”

Although what this zealous manufacturer has related may not be absolutely true in every circumstance of his narrative, yet we apprehend that no one can make any doubt, but that the French do import into that kingdom large quantities of English and Irish wool; that they work this wool up into manufactures for home consumption, as well as for foreign markets; that the French have, from time to time, allured over many of our most ingenious workmen, who have excelled in divers branches of the manufacture; that if the French have our native wool, and our workmen, they may certainly make as good woollen fabrics of every kind as we are able to do; that as the reputation of our woollen fabrics of every kind has been much longer established than that of the French, it is no way improbable but that the French have imitated the English manufactures as nearly as possible in every circumstance; and therefore, there does not appear any improbability but the French have also made use of the expedient of counterfeiting the English marks, seals, &c. as well as the *façon d'Angleterre*, or English manner, make, or fashion, in fabricating of our various species of woollen goods. And, therefore, it is very natural to believe, that, in order to introduce their woollen fabrics of every sort into those foreign countries, where the English had been long established before them, they made use of the expedient of imposing their woollen fabrics, made in France after the English manner, upon foreign countries for English foreign goods, and continue this practice to this day, by counterfeiting our seals and marks, the lengths and breadths of our goods, and the same method of package, &c. with every other circumstance that may the more effectually deceive.—And, to the end that this may remain undiscovered, can any thing be a more natural disguise than to send French woollen goods to foreign markets with some English woollen goods, made and packed after the same manner; and, at the same time, to export them in English bottoms, and, by the confederacy of English captains of ships with English merchants, and consigned also to factors abroad, who are in the secret?

All this is so very plausible, and such measures are so likely for the French to fall into, in order to supplant the English in the woollen manufacture in foreign countries, that we may, without any difficulty, or strain of belief, credit the same as matter of fact; especially when this Northamptonshire manufacturer asserts the same to be true, with such circumstances of truth and credibility.

And, if this matter should ever come to be thoroughly scrutinized into by authority, and proper measures be taken to get to the truth, we are inclinable to believe it will be found to have been the constant practice of the French for many years, and one of their grand strokes of commercial policy, to worm us out of the woollen manufactures of the whole world, if possible: and, if they

they can have English and Irish wool very cheap, in exchange for their brandies and wines, &c. which our wool-smugglers run into our country; and, if their labour is considerably cheaper than ours, what hinders but France may inevitably ruin all our woollen manufactures?

ABDELARI, an Egyptian plant, whose fruit would nearly resemble the melon, if it was less oblong and acute towards its extremities. *Ray. Hist. Plant.*

ABEL-MOSC, called by the French *ambrette*, or *graine de musc* (musk-feed) is the seed of a plant growing in Egypt, and in the Antilles islands. This plant has greenish and tufted leaves, very much resembling those of the marsh-mallows; on which account, modern botanists have given it the name of the *tufted marsh-mallow* of the Indies. The seed scarce exceeds in size a large pin's head, shaped like a small kidney, of a greyish colour, shagreened, as it were, on the upper side, and the scent like a compound of amber and musk. The chief use made of it is for the composition of some perfumes, with which it is with some difficulty incorporated, unless properly managed. The Italian perfumers consume considerable quantities of it; and in France the nuns and pater-noster makers use it in some of their chaplets, or bead-strings. The plant is filed by M. Tournefort, *ketmia Egyptiaca*, *semine moschato*, Egyptian ketmia, with seeds smelling like musk; and Mr. Miller, in his *Garaener's Dictionary*, observes, that it is commonly called musk-feed in the West-Indies. The *ambrette* of Martinico is the best of all, and ought to be chosen new, plump, dry, neat, and of a pleasing odour.

ABER, in the ancient British language, signifies the fall of a stream or rivulet into a river. Such is the origin of the names of several confluences of this kind, and of several towns and cities that have been built thereon; as *Aberdeen*, *Abercromway*, &c.

ABERDEENSHIRE, in *Scotland*, is bounded on the south with part of Angus and Merns, or rather with the river Dee and the Grampian Mountains; with part of Banff on the north-west; part of Murray on the north; the German Ocean on the east; and the river Spey, and part of Badenoch, on the west. The chief places of trade in *Aberdeenshire* are,

1. *Aberdeen*, one of the principal cities in this shire: there are two towns or cities of that name, the old and the new; the old lies about a mile northward from the new, and is situated in the mouth of the river Don, which is remarkable for its extraordinary plenty of salmon and perch.

2. *New Aberdeen*, situated at the mouth of the river Dee, exceeds all the cities in the north of Scotland for largeness and beauty. It stands in a fine air, and has a great revenue arising from its salmon fishery. The adjoining sea not only furnishes them with plenty of fish, but reproaches them with their negligence, when they see the Dutch fleets perpetually fishing on their coasts, to very great advantage: but it has been till lately the humour of the inhabitants to apply themselves chiefly to the salmon fishing, and to neglect that of all other sorts.

The quantity of salmon and perch, taken in both rivers, is a kind of prodigy. The proprietors are united into a company, there being so many shares, of which no person can enjoy above one at a time. The profits are very considerable, the salmon being sent abroad into different parts of the world, particularly into England, France, the Baltic, and several other parts.

The herring-fishery is a common blessing to all this shore of Scotland, and is, like the treasure of the Indies, at their door, were it properly conducted by the Scots in general: by it, however, the merchants of Aberdeen are enabled to carry on a trade to Dantzick and Königsberg, Riga and Narva, Wybourn and Stockholm.

They have also a very good manufacture of linen, and worsted stockings, which they send to England in great quantities. They make some so fine as to be sold from fourteen to thirty shillings a pair. They also send them over to Holland, and into the north and east seas, in great quantities; yet the poor who knit them, if they get two-pence sterling a day, think they make a good day's work.

They have a great exportation of pickled pork, packed up in barrels, which they send chiefly to the Dutch for victualling their East-India ships, and men of war, the Aberdeen pork having the reputation of being the best cured, for keeping on long voyages, of any in Europe.

They also export corn and meal; but they generally bring it from the Firth of Murray, or Cromarty, the corn coming from about Inverness, where they have great plenty.

The people of Aberdeen are indeed universal merchants, so far as the trade of the northern parts of the world will extend; and it may be justly esteemed the third city in Scotland, next after Edinburgh and Glasgow.

3. *Peterhead*, in this shire, on the south of the water of Ugie, is a sea-port of considerable trade, and has a bay or road that will contain 100 sail of ships, with good riding in eight or nine fathoms. It is high-water here when the moon is directly south.

4. *Strathbogy*, in this shire, is fruitful in corn and pasture, has horned cattle, sheep, and horses for exportation; and is remarkable for its fine linen yarn, spun here by the women, and sold to the merchants.

The trade of *Scotland*, particularly the linen manufacture, being at a very low ebb, before the year 1725, the royal boroughs, who are the guardians of the trade of *Scotland*, took under their consideration the state of their trade and manufactures, in their general annual convention, held at Edinburgh, in July 1725, and in several subsequent meetings of their grand annual committee in that year.

The society also for the improvement of agriculture, and many persons, well skilled in trade and manufactures, formed proposals and schemes for encouraging the manufactures and fisheries: the result of which was, that, in their meetings of February 1725, they resolved to address his majesty, to have the monies, settled by law for the encouragement of their manufactures, applied for that purpose, in such manner, as that all misapplication might be prevented.

The effect of this was, that King George I. was graciously pleased to write the following letter to the royal boroughs, which was presented to the convention by his majesty's advocate, upon the 6th of July, 1726, and has had very happy consequences in regard to their manufactures in general ever since.

Superscribed G. R.

Trusty and well beloved, we greet you well. We having observed, that the several sums of money received and provided by the treaty of union, and by divers acts of parliament, to be employed for the improvement of fisheries and manufactures in Scotland, have not hitherto been applied to the uses for which they were intended; principally, because no particular plan or method hath been concerted, directing the manner in which these sums should be applied for the said purposes. And being desirous to remove that hindrance, as speedily as may be, we have thought good to recommend to you, that, at your first general meeting in the month of July next, you do take into your consideration the state of the said fisheries and manufactures, and of the monies provided for encouraging the same; and that by yourselves, or by committees of your number, you do devise and propose, the particular methods, rules, and regulations, which to you shall seem the most proper, for the application of the said sums towards the encouraging and promoting fisheries, and such other manufactures and improvements in Scotland, as shall most conduce to the general good of the united kingdoms; and that you do return to us the propositions in which you shall have agreed, to the end, that, upon due consideration thereof, a certain method may be settled for the application and management of these sums for the future. The welfare of our loving people of Scotland, and the prosperity of the royal boroughs, is so much concerned in what we recommend to you, that we doubt not, but you will go on in the execution of what is expected from you, with the utmost diligence, unanimity, and impartiality: and, on our part, we assure

A B R

you of our countenance and encouragement in what you shall propose for the real good of our country, consistent with the general interest of our united kingdom, &c.

HOLLES NEWCASTLE.

In consequence of this letter from the throne, the convention agreed upon an answer, wherein they expressed their joy and gratitude to his majesty, for his tender concern for the welfare of Scotland; which filled the hearts of the most knowing people with great gratitude and loyalty, and animated them zealously to exert themselves to obtain several acts of parliament for regulating their linen manufacture, and promoting the fisheries in general of this part of the united kingdom. And, since this period of time, the linen manufactures of Scotland have rose to a very extraordinary perfection; and it is now to be most ardently wished and desired, that their fisheries will meet with such success and prosperity, as to employ numberless of the distressed poor, and prove as good a nursery for our British seamen as the coal-trade has been.

The reason of taking notice of king George I's regard to the improvement of the Scots manufactures and fisheries, is with a view to observe, what great and happy effects proceed from proper encouragement being given by authority to any particular branch of trade. The commissioners and trustees appointed in Scotland, in consequence hereof, for the care of their trade, were so affected with his majesty's tender concern for their prosperity, that they bestowed their time and attendance upon the service of the public, without fee or reward. Their meetings were frequent and regular. Every *sedesunt* manifested, that their service was of great use and importance to their country, by contributing greatly to advance the improvement and extension of their fisheries and manufactures of every kind. Numberless letters were received by their secretary from every corner of their country, for the solution of doubts and questions, together with petitions and applications for encouragements of various kinds upon different branches of trade; also memorials and complaints of abuses, defects, slovenly and unprofitable practices in the management of many parts of their manufacture, and proposals of improvements, and of the most frugal and expeditious methods of carrying on several branches of trade to the best advantage. These the commissioners duly weighed, and gave full satisfaction thereto by regular answers, according to the best information they could possibly receive. And such have been the good effects of this correspondence, and zeal for the interest of trade since, that we may truly say, that the whole face of Scotland is changed. But, under the head of Scotland, we shall represent the general state of the trade of that part of the united kingdom.

ABHAL, a fruit of a ruddy colour, well known in the East, nearly about the bigness of that of the cypress, and gathered from a tree of the same species. It is held to be a powerful emmanagogue. *Dr. James's Dictionary.*

ABIT or ABOIT. Some use this word as expressive of *ceruse*.

ABLAB, a shrub of the height of a vine. It is said that it grows in Egypt, that it preserves its verdure both winter and summer, that it lasts a century, that its leaves and flowers resemble those of the Turkish bean, that its beans serve for food in Egypt, and a remedy against coughs and the retention of urine, &c. But we must wait till naturalists speak more clearly of this plant, to give credit to its properties.

ABLAQUE, a name which the French give to a silk of Persia, otherwise called the *ardassine*. This silk comes by the way of Smyrna, and is very beautiful; but as it will not bear hot water in the winding, there are few works in which it can be employed.

ABOU COUCHOU, a sort of woollen cloth manufactured in Languedoc, Provence, and Dauphiné in France, and sent to the Levant from Marseilles.

ABRA, a Polish coin, worth about $12d. \frac{1}{2}$ sterling. It is current in some districts of Germany; at Constantinople, where it is received for one fourth of an *asiani*;

A B R

and at Astracan, Smyrna, and Cairo: it is valued on the footing of a Dutch dollar.

ABBREVIATIONS, are initial letters or characters, used by merchants, traders, bankers, and book-keepers, for abridging certain terms of trade, and making their writing shorter. The principal used by the French are as follow. We have set down their explanation in French, as better adapted than an English translation, to convey to the merchant a just and succinct idea of the *abreviation*.

C. signifie	Compte.
C. O.	Compte ouvert.
C. C.	Compte courant.
M. C.	Mon compte.
S. C.	Son compte.
L. C.	Leur compte.
N. C.	Notre compte.
A.	Accepté.
ACCEPTÉ S. P.	Accepté sous protest.
ACCEPTÉ S. P. C.	Accepté sous protest pour mettre à compte.
A. P.	à protester.
P.	Protesté ou payé.
TR ^e . ou TR ^s .	Traite ou Traités.
Rs.	Remises.
R.	Reçu.
P ^r . ^c	Pour cent.
N ^o .	Numero.
F ^o .	Folio ou page.
R ^o .	Recto.
V ^o .	Verso.
V.	Ecu de 60 sols ou de trois livres tournois.
W.	Ecu de 120 sols ou de six livres tournois.
FL. ou F ^s .	Florins.
R ^x . ou R ^{ix} .	Richedale, risdale, rixdale ou retchedale.
DAL. ou D ^{re} .	Daller ou daldre.
DUC. ou D ^o .	Ducat.
M. L.	Marc lubs.
L. ST.	Livres sterlings.
L. DE G. ou L. G.	Livres de gros.
£. ou £ ^s .	Livres tournois.
S. ou s ^s .	Sols tournois.
D. ou d.	Deniers tournois.
lb.	Livres de poids.
M. ou M ^c .	Mares.
ONC. ou ON.	Onces.
G.	Gros.
DEN.	Denier ou gros.
D ^o .	Dito.
℥.	Dit.

The traders and bankers of Holland have also their peculiar abbreviations. As all the merchandizes that are sold in Holland, and particularly at Amsterdam, are sold there by livres de gros, by rixdollars, by florins of gold, by florins, by sous de gros, by common sous, and by deniers de gros, in order to abridge all those monies of account, the following characters are used.

Livres de gros	Ld. & Lv. in French.
	LS. in Dutch.
Rixdollars	R.
Florins of gold	F. d'or in French.
	ss in Dutch.
Florins.	F.
Sous de gros	£.
Common sous	S in French & fl. X. in Dutch.
Deniers de gros	℥.

Abreviations for the weights.

Schippond, a weight of three hundred pounds.	Schip ^t .
Lispont, a weight of fifteen pounds.	L. p ^t .
Quintal, a weight of a hundred pounds.	C ^t . or $\frac{c}{2}$
The Pound of two marcs, or 16 ounces.	lb.
Steen, or stone, a weight of eight pounds.	Stz. See CHARACTER.

ABRIDGMENT, a summary, or contraction of a writing, &c. wherein the less material things being omitted, or more briefly mentioned, the whole is brought into a lesser compass.

ABROHANI, or **MALLEMOLLE**, the name of a certain muslin, or clear, white, fine cotton-cloth, brought from the East-Indies, and particularly from Bengal, being in length sixteen ells and three-quarters, and in breadth five-eighths. See **MUSLIN**.

ABROLHOS, or *aperi oculos*, dreadful rocks near the island of St. Barbara, within twenty leagues of the coast of Brazil.

ABROTANOIDES, a kind of coral, resembling the female *southernwood*, from whence it has its name. It is found, according to Clusius, who gave it this name, on rocks in the bottom of the sea.

ABROTANUM, male and female, a well-known plant by the name of *southernwood*.

ABRUS, a species of red bean, that grows in Egypt and the Indies. *Ray. Hist. Plant.*

The *abrus* is brought from both Indies. The seed which is used, is of two sorts, the one large as a great pea, ash-coloured and blackish; the other somewhat larger than the common one: both are of a deep red, and are recommended for inflammations of the eyes, in rheums, &c.

ABRUZZO, a province in the kingdom of Naples, in Italy. It is divided into two parts, the one called the *Farther Abruzzo*, the other the *Nigher Abruzzo*. The former of these is bounded on the north-west, by *Marca d'Ancona*; on the south-west, by *Sabina* and *Campagna di Roma*; on the south-east, by the *Nigher Abruzzo*; and on the north-east, by the *Adriatic-sea*.

This country is cold and mountainous, being crossed by the *Apennines*; yet is fertile in grain, fruits, and especially in saffron; and breeds great quantities of beasts, both wild and tame. It is healthy, pleasant, and well-inhabited; and the people are industrious, given to traffic, and some manufactures, particularly the woollen.

The *Nigher Abruzzo* is more mountainous and cold than the other, and yet is far from being so healthy as that. The rivers of it are the *Lenta*, *Foro*, *Moro*, *Feltrino*, *Sangro*, *Agnella*, and *Irigno*. The country watered by them produces great plenty of corn, rice, vines, fruit, and especially saffron; but here are many large woods, that shelter great number of wolves, bears, and other wild creatures, which oblige travellers to go always in troops, and well armed: this prevents improvements in trade.

Ortona al Mare, in this province, so called to distinguish it from *Ortona di Mani*, in the same province, is an ancient town belonging to the *Frintani*, and situate on the *Adriatic gulph*, between the rivers of *Foro* and *Moro*. It had formerly a convenient and safe harbour for shipping, but is now thinly inhabited, and little frequented, because the Venetians spoiled the haven. Whence we may observe, that, in places where there is no trade, they are hardly worth taking notice of.

ABSINTHIUM, *wormwood*. There are several species of this plant, but that generally used in medicine, is the *Absinthium vulgare offic.* of Parkinson, 98. *Absinthium vulgare majus*, of J. Bauhine, iii. 168. *Absinthium latifolium seu ponticum*, of Ger. 937. Tourn. Inst. 457. Boerh. Ind. A. 125. It grows in lanes by highways, and in waste places, and flowers in July. Its root is thick and woody, divided into several portions. In the summer it shoots out into several woody, strait, hoary stalks, two or three feet high, full of a white pith, and with several leaves growing on them; those towards the top are long, narrow, and very little indented, having among them long spikes of small, yellowish, naked flowers, many growing together, hanging down their heads, and including very small seeds. The leaves and flowers have a very bitter taste, and a strong smell.

The virtues of this herb, says Boerhaave, are immortal; for its juice cures all sorts of dropries, provided there be no rupture of the viscera. An extract of the green leaves is of singular service to such as labour under a languor. A conserve is also made of the tender tops of the leaves, which is called the Father of the stomach, and is of excellent use in the jaundice, cachexia, green-sickness, and where the stomach is clogged with phlegm and inactive bile, but of no service in a hot distemperature. An infusion of the leaves in wine, is good against

worms; but in general it is unfriendly to the nerves, as are the greater part of bitters.

From the black mafs remaining in the retort, and calcined by a reveratory fire, ashes are extracted, which yield by lixiviation a fixt salt purely alcaline. The comparison of other elements, and their quantity obtained from wormwood, demonstrate that the leaves have more subtil and volatile parts than the flowers and feeds; that they have, by far less acid salt and oil than the tops: whence it follows, that the leaves contain an ammoniacal salt, and a great deal of subtil oil; and that a tartarous salt, united with an ammoniacal salt, is met with in the tops; but it seems that its efficacy principally depends on its essential oil, which is bitter and aromatic; and though the same appears in the leaves and tops, yet it is more subtil, more diffused, and more volatile in the leaves, on account of its intimate union with the volatile salts.

ABUCCO, or **ABOCCO**, or **ABOCCHI**, a weight used in the kingdom of Pegu; it is equivalent to a pound and a half, and four ounces and a half, light weight of Venice. See **VENICE**, for its weights.

ABUKESB, the name given by the Arabs to the Dutch dollar, which is current among them. The lion struck on it is so ill represented, that it is easy to take it for a dog; and this is the reason of its being called *abukeß* by the Arabs, which signifies a *dog* in their language.

ABUTILON, the shrubby woolly Indian mallow, with a large spread flower, having a single cup. The most common sort of this plant grows plentifully in North America, where it is often used for the same purposes as the marsh-mallow is in Europe. The seeds are frequently brought from thence to England, and the plants thrive very well in the open air, and perfect their seeds, which if suffered to scatter, will produce young plants the following spring; but they are annual, and perish with the first frost in Autumn. There are not any species of this plant used in medicine, or for any other purpose in England, though many of them, which abound in the islands of America, as also in most parts of Asia and Africa, are frequently used by the inhabitants, as emollients; and, in some countries, the young plants are boiled and eaten as other salad herbs. *Miller*.

The Authors of the French Encyclopedie say, that the leaves and seeds of this plant are used. Its leaves applied to ulcers cleanse them. Its seeds provoke urine, and expel gravel. It is diuretic and vulnerary.

ABYSSINIA, a division of *Æthiopia* in *Africa*, has now little communication with the rest of the world, the Turks having possessed themselves of *Abyss*, which runs along the western coast of the *Red Sea*, and the rest of it being surrounded by mountains, or unpassable deserts. Within these it appears to be an exceeding fine country, diversified with woods and fruitful plains, well planted with palm-trees, dates, and cedars, and watered by several noble rivers. The river *Nile* runs in the midst of it, and having first taken a circuit almost round its source, runs 100 miles to the northward, and afterwards 200 miles towards the east; then turning to the south and south-east, continues its course 250 miles further. In this course it forms the lake of Dambea, of 120 miles extent. From thence it takes a semicircular sweep of 500 miles, and then turning directly north, enters the kingdom of *Egypt*. This winding course not only renders the soil extremely fertile, but is of great advantage to inland commerce; though after the *Nile's* entering *Egypt*, there are so many steep falls and cataracts, that the river is no longer properly navigable for the purposes of traffic. Being swelled by the rains which annually fall at a certain season between the tropics, it overflows all the lower grounds that border on it; and this is the case of all the rivers that rise within the tropics, though the ancients were at so great a loss to account for this periodical flood; and what encreases the flood still more, are the torrents that fall from the numerous hills with which this country is incumbered. The inhabitants, however, have this advantage from their hills, that they can remove thither in the hot season, and enjoy a cooler air than

than they do in *Egypt*, which lies several degrees north of *Abyssinia*. Their vallies, also, rendered fruitful by the annual rains and the numerous rivulets, produce plenty of corn, rice, wine, flax, sugar, and fruits proper for the climate. Their flax is esteemed the finest in the world; and from hence it is said, the Egyptians had theirs, of which they made the fine linnen of *Egypt* mentioned in the scripture; and had they, at this day, an opportunity of exporting the produce of their soil, this country alone, it is thought, might raise rice, sugar, and other commodities, sufficient to supply all the neighbouring countries. The Turks, who are masters of the coasts of the *Red Sea*, though they will suffer no other nation to trade to *Abyssinia*, annually export great quantities of rice from hence, particularly at the times of the great pilgrimages to *Mecca*, *Arabia* not affording provisions sufficient for their subsistence. Gold is also very plentiful here, of which the Turks get some; and had the *Abyssinians* an opportunity of bartering it for the merchandize of *Europe*, as great a plenty of it might be found in this country as any where, though none of the gold mines are wrought at present, but only those of silver and copper. Amongst other precious stones they have the largest emeralds in the world. Their cattle are camels, oxen, sheep, asses, all in great plenty, and very large; their wild beasts are such as are common to the rest of *Africa*; but what they are most famous for is an excellent breed of horses, equal to those of *Arabia*; or, as some conjecture, those of *Arabia* are, in reality, bred in *Abyssinia*, where they abound in rich pastures. As to the persons of the *Ethiopians* or *Abyssinians*, they are generally of a good stature; their complexion a deep black, but their features more agreeable than their southern neighbours, having neither flat noses, nor thick lips, like the other *Caffres*. The sovereign of this country was once absolute; but at present the great men set up for princes in their respective governments, and the king can transact nothing of any consequence without them. It was the king of this country, that the Europeans used to stile *Prester John*. The Portuguese, it is said, when they first discovered it, seeing a cross always carried before him, stiled him *Priest*, *Prebyter Maximus*. He took upon him the supreme ecclesiastical, as well as civil power; others say the Turks gave him the name of *Prester-Cham*, or *Cam*, that is, king of slaves, because they purchased most of their negro slaves in this country. The government appears now to be a republic, or rather a mixed monarchy, in which the prince's power is extremely limited by the great men. As to the common people, it is not very material whether the power be lodged in the king or lords, for they are slaves either to the one or the other. Their religion is a mixture of Christianity and Judaism; but they seem to adhere more to the Greek church than to the Latin. They keep both the Christian and the Jewish sabbath, and both baptise and circumcise their children, and even their females. They are said to have a great deal of vivacity and natural wit, to be of a teachable disposition, and fond of learning, though they have but few opportunities of improving themselves. The better sort of them are clothed in vests, made of silk stuffs or cotton, after the manner of the Franks in Turkey; but their poor people go almost naked, having only a small piece of skin, or coarse stuff, wrapped about their waists. They have no other bread than thin cakes baked upon the hearth as they want them: they eat all manner of flesh almost as the Europeans do, except swine's flesh, and such other meats as were prohibited to the Jews; they also abstain from things strangled, and from blood, killing their meat in the same manner as the Jews do. As to the poor people, they live chiefly upon milk, butter, cheese, roots, herbs, and what their flocks and herds produce. This is the country from whence, it is supposed, the queen of *Sheba* came to hear the wisdom of Solomon; and from whence the Eunuch, prime minister of queen *Candace*, came, who was converted to Christianity, and baptized by St. Philip. *Ethiopia* was then a mighty empire, subject to one sovereign, who commanded the sea-coast, as well as the inland country. When the Portuguese missionaries resorted to *Ethiopia* towards the latter end of the fifteenth century, they

brought over a great many of the *Ethiopians* to their religion, and persuaded the emperor not only to acknowledge the pope's supremacy, but to admit a patriarch amongst them, sent thither from *Rome*. The government also consented to abolish their ancient rites and ceremonies, and conform entirely to the ritual of the Latin church; but many of the nobility and governors of the provinces, with a majority of the common people, having the greatest abhorrence of these innovations, rose in arms against their emperor, which occasioned civil wars in *Ethiopia*, that lasted upwards of 100 years, wherein many thousands were killed. But the court, with the assistance of the Jesuits, European engineers, and some Portuguese troops, were generally victorious over those of the ancient religion, but could never subdue their obstinate perseverance in it; and several provinces revolted entirely from the emperor. However, the *Ethiopian* emperor continued still to profess the tenets of the Latin church, and to submit to the dictates of *Rome*; till at length the Jesuits, under pretence of maintaining the pope's ecclesiastical jurisdiction, took upon them to direct most of the secular affairs, treating the prince rather as a viceroy to the pope, than sovereign of the country; and having erected and garrisoned several forts, were sending for European forces to maintain their usurped power, when the emperor as well as the nobility, taking the alarm, agreed at once to abolish popery, and restore their ancient religion. The Romish priests were hereupon generally sacrificed to the fury of the people, and their patriarch very narrowly escaped out of the country with his life: and when afterwards three capuchins came as far as *Squaquena*, upon the *Red Sea*, from whence they sent letters to the emperor of *Ethiopia* to obtain leave to come into his territories again; that prince requested the Turkish *basia*, who commanded on the coast, to suffer no Franks to come that way into his territories, and to send him the heads of these Capuchins. This the *basia* not only obliged him in, but sent him their skins flayed off and stuffed, that he might know them to be Franks by their colour, and priests by their shaved crowns. Thus have the Romish missionaries procured themselves to be banished out of almost every country where they have planted their religion. They have indeed by their skill in medicine and mathematics, and an artful address, insinuated themselves into the courts of many great princes; but their ill advised advancing of the pope's supremacy to an extravagant height, together with their endeavours to controul the government in civil, as well as ecclesiastical matters, has ever occasioned their expulsion. Thus it was in *Japan*, where the emperor finding them encroaching upon his civil authority, ordered every christian in his dominions to be massacred, and that no christian should ever set foot on shore there again. This also has put a stop to their progress in *China*, and occasioned very severe persecutions of the Christians there. Still the Jesuits go on in their encroachments on princes where they have an opportunity; but the consequence must be, as we have lately found it verified by the conduct of the kings of Portugal and France, that they will at length procure their own extirpation by the general consent of Christian princes, as the Knights-Templars did by their insolence in the fourteenth century. There seems nothing more material to add in regard to the *Abyssinians*, but that the sons of the emperor succeed according to their seniority, as do those of the nobility, who have obtained an independency; but the rest of the people have no inheritance of their lands, nor can dispose of their estates or effects, but by the permission of the emperor, or their respective lords. The prince is entitled *Nogafsch* by his subjects, which in their language signifies, *king of kings*, and for this reason the Europeans give him the title of emperor. The Persians also give him the title of *Pat-sha*, the disposer of kingdoms, which is the highest title known in *Asia*, and equal to that of emperor in *Europe*. But every one of these princes, at his accession to the throne, assumes a particular title: one stiles himself the *Pillar of Faith*; another the *Virgin's Incense*; and another, the *Beloved of God*, sprung from the stock of *Judah*, the son of *David*, son of *Solomon*, &c. for they have a tradition, that their

princes are descended from Solomon by the queen of *Sheba*. The arms of the emperor are a lion rampant, holding a cross, with this motto, *Vicit Leo de Tribu Judab*. To sum up in a few words the principal articles this vast region of Africa produces for the purposes of commerce, they may be said to consist of gold, silver, copper, and iron: the other commodities are cardamoms, ginger, aloes, myrrh, cassia, civet, ebony, ivory, wax, honey, cotton, and linnens made of it of various colours; and we might add sugar, hemp, flax, and excellent wine, if these people (demi-barbarians) had the art to prepare and boil the canes juice, to cultivate the vines, and press the grapes, and to spin and weave their hemp and flax, as all these things grow with them in abundance, and of as good qualities, as in any other part of the world.

ACACIA, a tree with leguminous flowers, and leaves disposed commonly by pairs. The style runs out of the cup, and is enclosed by a fringed membrane; it becomes afterwards a flat pod that opens in two parts, and contains seeds in form of a kidney. *Tournefort. Inst. Rei Herb.*

ACACIA, *acacia nostras*, is that which is called the common *acacia* of America. It does not rise very high; its wood is hard and uneven, its leaves long and small, yielding little shade, and its branches full of thorns. In the spring it produces very agreeable flowers.

ACACIA, a thick, gummy juice, of a brown colour externally, and blackish, reddish, or yellowish internally; it is of a firm and hard consistence, melting or becoming soft in the mouth; of an austere astringent taste, but not disagreeable, and formed into small roundish masses, weighing four, six, or eight ounces, and wrapped up in thin bladders. It comes to us from Egypt. The best is that which is fresh, pure, neat, and easily dissolves in water. This juice is extracted from the unripe pods of a tree, called *acacia folio scorpioidis leguminosae*, C. B. P. The tree is large, and very branchy, and the branches armed with thorns; the roots spread on all sides, and the trunk is often a foot thick, and equals or even surpasses in height the other species of *acacia*. This tree is common at Great Cairo; the unripe pods, being sprinkled with water, are pounded, and the juice squeezed out, which is boiled to thicken it; afterwards it is made up into small masses. This juice analysed yields a small portion of acid salt, a very small quantity of alkaline salt, a great deal of astringent earth, and a great deal of oil either subtiler or gross. It is ranked among the incoarctant and repercussive astringents: it strengthens the stomach, makes vomiting to cease, stops hemorrhages and fluxes of the belly: it is given from half to one drachm, under the form of powder or bolus, or with some suitable liquor. The Egyptians prescribe it every morning for those that spit blood, to the amount of a drachm dissolved in some liquor. The juice of *acacia* is an ingredient in the theriaca, mithridate, the trochisks of Karabe, and the styptic linguent of Charas. It serves the curriers of Grand Cairo for blackening their leather. To this *true acacia* is often substituted the *acacia nostras*, the juice of which is more acid; it is extracted from the fresh and unripe berries of that plant, and has much the same properties as the *true acacia*.

ACACIA GERMANICA, or German *acacia*, is a counterfeited drug, made of the juice of sloes, or wild plums, which grow upon the black-thorn. The juice, being boiled into a solid consistence, is put into bladders, like the *true acacia*, which comes from Egypt. However, it is scarce possible to be mistaken in the choice of this drug, the *true acacia* being most commonly of a reddish tan-colour, and the German as black as Spanish liquorice. Lemery observes, that the alteration or difference of colour in the *true acacia*, may be owing to its being prepared from the ripe or unripe fruit. The ripe fruit yields a blackish juice, the unripe reddish or yellowish, and of a sweet scent.

ACADIA. See NOVA SCOTIA.

ACAJA, a tree of the height of the linden-tree, with rough, uneven bark, of an ash-colour, like that of elder; the leaves are soft to the touch, opposed to one another, four fingers breadth long, and one and a half, or two broad, of unequal bigness, shining, and traversed

in their length by a large rib. It bears yellow flowers, to which succeed plums like ours both in figure and size, yellow, acid, the stone ligneous, easily broken, and containing a kernel of a yellowish white. Its wood is red and light as cork. Its leaf is astringent; its plums are good in fevers and dysenteries; a wine is expressed from them; and its buds are pickled. *Ray. Hist. Plant.*

ACAJOU, is a kind of plant with a monopetalous flower, in form of a funnel, and with deep incisures. There proceeds from the cup a style surrounded with filaments, and adhering to the hinder part of the flower as a nail. This cup becomes afterwards a soft fruit, at the end of which is found a capsule in the shape of a kidney, which contains also a seed of the same form. *Tournefort. Inst. Rei Herb. Append.*

The *acajou* grows in all parts of Malabar, though it is originally from Brazil. A liquor is extracted from it that inebriates like wine. The kernel of its nut is eaten roasted; but the shell is so acrimonious, that it excoiates the gums, if the nut should happen to be cracked between the teeth. Dyers use the oil expressed from the nut in dying black. The inhabitants of Brazil reckon their age by these nuts, locking up one of them every year.

The *acajou* nuts should be chosen fresh, and of an olive colour. When incisions are made in the *acajou* tree, it emits a clear transparent gum, very like gum arabic.

The Chevalier des Marchais, in his *Voyage de Guinée*, Tom. iii. p. 266, says, That there are two kinds of *acajou*; the first is that to which the Spaniards have given the name of cedar, on account of the scent of its wood, though in reality it differs as much from the cedar, as the cedar does from the apple-tree. The second kind has retained, throughout all America, the name which the Indians of all nations have given it, with so little difference from each other, that it is plainly known to be the same in all their idioms. This tree is so common, that there are whole forests of it in Brazil and Guinea. The Portuguese have no remedy more sure for curing their negroes of a pain in the stomach, which is a kind of dropsy, than to leave them to themselves in places abounding with these trees. Hunger pressing these poor wretches, and they not finding any other food but the fruit of *acajou*, they glut themselves with it; and the fruit soon cutting the noxious humours, that occasion the distemper, these dropical slaves, who were scarce able to stir, are seen in a short time running like stags, and in a surprising state of health.

The nut which the fruit bears at its extremity contains in the shell an oil, the more sharp and biting, the less ripe it is. This oil is, however, of wonderful use in drying up and cleansing the oldest ulcers, and all other diseases of the skin; and also for killing those dangerous insects that get under the toe nails, and into the wrinkles of the skin, where they occasion ulcers that are frequently incurable. The Portuguese call them *bichos*, the Spaniards *inguas*, and the French *chiques*.

In proportion as the fruit ripens, the sharpness of the oil decreases; but there always remains more than enough to make the tongue and gums of those smart, who are so imprudent as to crack the nuts with their teeth.

There is no occasion to extract this oil in the country where the fruit grows, in order to bring it to Europe; it being sufficient to send the nuts thither. Though never so stale, they always retain oil enough. In order to extract it, they must be split, and its pieces laid upon burning charcoal. The oil, which is contained between the two coats of the shell, comes out as soon as it feels the fire, and being collected with a little cotton, is applied to the uses as above-mentioned. The kernel contained in this shell is white, solid, delicate, and of a better taste than the best almonds, and is much like that in the stone of a pine apple. These nuts are eaten raw when fresh gathered, after having been steeped for a short time in water, with a little salt. Many like them better roasted. In order to this, the shell is a little broken, and being laid for a moment on the coals, it will open of itself; the kernel taken out, and a little brown skin that covers it being peeled off, it is then of a delicious taste. These nuts will keep many years, and scarce lose

any thing of their goodness. The Indians set so great a value upon the fruit of the *acajou*, and the nut which adheres to it, that they often make war with each other for the crop of this fruit; which in Guinea is ripe in the months of December, January, and February.

This fruit is of the form of an apple. The skin is thin and smooth, of a fine red on the side next to the sun, and of a gold colour on the opposite side. Their smell is sweet, agreeable, and comforting. Their substance is entirely spongy, and full of an exceeding tart and styptic liquor, before the fruit is ripe; but sweet, pleasant, and wholesome, when it has attained its maturity. They refresh and exhilarate; and, though they are a little binding, yet they wonderfully provoke urine.

They make a tart and pleasant wine of it, which is heady, kept two or three days, after which it turns into a very sharp vinegar. People of skill might make a wine of it, that would keep longer: some have caused the juice of the *acajou* fruit to be distilled, which has produced a very strong spirit.

This tree, during the great heats, emits lumps of gum, of an amber colour, hard and friable, or apt to crumble. The Indians dissolve it in water, and give it with success to women troubled with hysterical disorders, or other uterine maladies. This gum has little or no scent.

ACANTHUS, BRANK URSINE, or BEARS-BREECH. Doctor Linnæus mentions but two species of this genus, which are European plants; these are the smooth and prickly bears-breech. The essential characters are the same in both, the difference between the two species being in their leaves, the prickly being much more jagged, and the incisions of the leaves being terminated by spines; whereas those of the other sort have fewer cuts, which are obtuse, and have no spines on them. The smooth sort is that which is directed by the college of physicians to be used in medicine; but it is now rarely prescribed, for the herb-women generally supplied the markets with either the helleborafter, or sphondylium, instead of this plant; so that when it was ordered, the right plant was very seldom used; which may have occasioned the leaving of it out of practice. The Germans in general substitute the sphondylium or cowparsnep for this, which is by most of their writers intitled *Branca Ursina*; by which name it is mentioned in all their Dispensaries. The leaves of this sort are a foot and half long, about nine inches broad, arising with a foot-stalk immediately from the root; between the leaves arise the flower-stems, which are commonly three feet high, and garnished with flowers from near the ground to their top. These plants begin to flower the end of May, and continue till the latter end of August; the flowers at the bottom of the spike appearing first, so that on the same spike there is often a continuation of flowers near two months.

It is generally supposed, that the foliage on the capitals of the Corinthian pillar is taken from the smooth sort of *acanthus*; but by those figures which we see represented in books of architecture, they have a much nearer resemblance to the *Brank Ursine* with fewer and shorter prickles, described by Tournefort, *Inst. Rei Herb.* And as this sort grows naturally in many places in Italy, and also in the islands of the Archipelago, so we may suppose that this may be the plant from which they composed the capitals of the pillars of that order of architecture, especially as it is much more common in those countries.

The newly gathered leaves of this plant have yielded, in the analysis made of them, phlegm without smell or taste, but charged with a small quantity of pungent salt, which disturbed the solution of Saturn; a liquor first bordering upon acid, which became so manifestly afterwards, and which was even somewhat alkaline; a reddish empyreumatic liquor, slightly acid, but abounding with an alkaline urinous salt, and a great deal of volatile salt; oil, both fluid and thick. The black mass remaining in the retort calcined by a reverberatory fire, yielded whitish ashes, whence by lixiviation a purely alkaline salt was extracted. From this analysis the relative quantity of the things extracted, and the viscosity of the plant, it follows that it contains a great deal of salt am-

moniac, and a little oil obvolved in a great deal of phlegm. No part of this plant is used but its leaves, in clysters, fomentations, and cataplasms.

ACAPULCO, a city and port town of America in Mexico, on the South-sea, long. 276. lat. 17. This is the western port to the city of Mexico, as Vera Cruz is the northern; and the principal places of its trade, are Peru, the Philippines, and the coasts nearest to Mexico. The merchants of *Acapulco* send their goods on light vessels to the latter, for extracting provisions and refreshments, though they receive large parcels by land on mules, particularly flour, chocolate, small cheese, salt meat, and all sorts of such provisions, for which they have daily a market; and the cattle they want comes the same way. The inhabitants of this city make but little use of the trade between the northern and southern America, though open and free, their commerce being only extended to the places on the coast; so that what is transacted between this and the Manillas, is what gives it reputation, and which is carried on, in only two ships of 800 or 1000 tons each; whereof one is always in loading at the Philippines, and sails on its return, as soon as its twin vessel arrives, a convoy being assigned them, of a twenty-eight gun ship, and they mounting forty each. Their cargo from *Acapulco* consists partly of European merchandize, brought to Mexico from La Vera Cruz, and partly of the products of New Spain, both sent to the South-sea on mules. The reloading is composed of whatsoever Asia produces, that is either rich or valuable, even pearls, precious stones, and gold dust, with which these ships are so fully stowed, as to render their between-deck-guns unserviceable, in case of an attack. *Lex Mercatoria.*

It is a great, though general mistake, that the Spaniards employ but two ships to Manilla, one of which goes and one returns every year; for they send out two ships or galleons, and receive back two every year. Sometimes indeed it happens that they come not back till two years, but that is extraordinary, and by accident. The burthen or cargo these ships carry is very great; the ordinary loading, besides their guns and stores, being 1000 or 1100 ton each; and they had one many years which carried 1600 ton.

Those Manilla ships are always full laden outwards with European goods, besides the silver, and bring back likewise a full loading of all sorts of East-India and China goods; and all these goods, both out and home, except what are sent southward to Panama and Lima, are carried by land-carriage from and to Mexico, which is about 240 miles: and these goods by computation, besides what may go to Lima and that way, cannot be less than 4000 ton in weight, that is, 2000 ton one way, and 2000 ton the other. And this encreases the trade of the country in the employment of people, horses, mules, and carriages.

The *Acapulco* ships carry all sorts of European goods from America, and with them furnish the Spaniards at Manilla chiefly, and the Indians of the Philippine islands in general, whom the Spaniards have taught to go clothed after the Spanish manner, with all kind of European manufactures: some of these are also sold to the Maylayans, and the Indians of all the coasts and islands contiguous; but much more considerable in value are the utensils, weapons, fire-arms, workmen's tools, and all heavy goods made of iron and brass, which are brought from *Acapulco*, and vended amongst all those Indians to great advantage. Unwrought iron, or iron in bars, is also brought from old Spain to *Acapulco*, and carried from thence to Manilla; where the Chinese and Japanese, who are the best cutlers in India, and make all manner of utensils, purchase large quantities of iron and brass of the Spaniards. Both Chinese and Japanese are pretty curious workers in most kind of hard-ware in gold and silver: they are good founders, turners, goldsmiths, and locksmiths; but not good gunsmiths, nor sword-blade makers.

However, being very dextrous in their way, and having great variety of materials by the Spanish ships from *Acapulco*, this occasions a numerous resort of traders at Manilla, from whence they disperse their goods to the other Indian islands, and trade with their respective countries

trics and countrymen, even in the European factories; as in Borneo in particular, and to Sumatra and Malacca, where some of those European goods are vended amongst the natives.

But as for the manufactures of woollen, linen, or silk, they are of small use, except to the Spaniards themselves; the Chinese and Japanese supplying themselves with cotton manufactures of all kinds, such as muslins, calicoes, &c. Yet the Spaniards find several things brought by the *Acapulco* ships, with which the natives of those countries are greatly taken, and for which they get in return the product of their countries, which being of very little value there, and of great value in America, the traffic is by so much the easier; as particularly beads, toys, looking-glasses, pins, needles, and all kinds of small wares of iron, steel, pewter, and brass; with variety of glass-ware, which is particularly valued by the Indians in general. In return, the product of the place is of itself rich, and of infinite value among the Spaniards; as especially their precious perfumes, which being originals, and the produce of mere nature, are extremely dear when they come to New Spain, as ambergrease, civet, bezoar, &c. Nor does any nation in Europe or America use more than the Spaniards, both men and women, particularly in the hot climates of Mexico and Peru. Besides these, they have several other valuable products, which never lose or lessen their price, amongst Christian nations, although they may have the same things amongst themselves; as particularly, 1. Very large pearls of a good colour, which the Spaniards tell us are the best in the East, the oriental pearl being found on the coast of India, in the mouth of the Persian gulph, and at Ormus, and parts adjacent in the Persian gulph; and reputed much finer and fairer than any of the Batavian or Borneo pearls, or most others. 2. They have also gold, which is found in almost its utmost purity, and of the most perfect quality, in the rivers, as in other countries, and in some mountains: they send about the value of 50000 doubloons a year to New Spain in this metal only. How it may agree with the account some give us, that this country costs the king of Spain 250000 pieces of eight a year to support it, more than the produce, is not easily reconcilable: we are rather of opinion, that they supply the treasury of Spain with those 50000 doubloons in gold every year, as the product of this government; for if it were otherwise, how should the governors, who live in such state and pomp, not to be equalled by some sovereign princes, lay up such immense sums in the eight years of their government, (for so long they continue at the Philippines) and appear so rich in Europe as it is said they do? For we are told that they generally return back to Europe, or to *Acapulco*, with a treasure of two millions of pieces of eight, or more.

They have also great plenty of honey and wax; both which, but especially the latter, is very valuable in Spanish America, and is carried thither yearly in large quantities. They have valuable drugs and gums of divers kinds, which the Spanish padres, who are generally physicians, collect and send to their particular societies in America, and they again to Europe: so that they are a kind of merchandize peculiar to themselves. Of these they name several, which are in great estimation, as the cassia, aloes, gum arabic, sago, camphire, and several others, with medicinal herbs, of which they have no small variety.

The articles are very considerable that enable the Spaniards to make so rich a return to America by their *Acapulco* ships. They have the richest spices of the East, drugs, diamonds, and gold, muslins, calicoes, China taffeties, rich attases, and several other sorts of the richest wrought silks, China ware, and tea, fine lacquered ware, cabinet work, tables, screens, umbrellas, and other niceties of the country. Thus the Philippines, by the course of their neighbouring trade, are furnished with stores of merchandize for making their return to *Acapulco*, and that in a manner fully to the satisfaction of the Spaniards, who usually make a profit of four for one in all the goods they send from *Acapulco* to Manilla.

It may be wondered why the Spaniards so strictly confine themselves to the sending of no more than two ships a year on this trade; nor can we easily suggest the rea-

son for it: however, the merchants make themselves amends another way, for they build those ships so vastly large, that they ordinarily carry from ten to twelve, or fourteen hundred ton burden. So that though it is making a great adventure in one bottom, yet as those seas are generally very safe and pacific, they can afford the freight the cheaper in proportion: and on the other hand, as these large ships are built prodigious strong, they are able to bear the sea with the greatest steadiness, if navigated by able seamen.

Above all, they are the more secure against pirates and rovers, who cannot easily hurt them, and dare not, as the seamen term it, lay by their side; for they have all three decks, and carry large guns of twenty-four to thirty pound ball, which the smaller ships cannot bear the shot of: on the other hand, the smaller ships can hardly, except by fire only, any way hurt these great ships, and to hurt them does not answer the pirates end. When Rogers and Cook attacked the *Acapulco*, or Manilla ships, they took a ship of about 4 or 500 ton; but when they came to attack the great carrac, a ship of 1200 ton, they could make nothing of her; every shot they received made them tremble, and stand off to stop the leak: whereas, the shot they made at the carrac stuck in her sides, but could not go through; and when they thought to board her, she boomed them off with great pieces thrust out by the multitude of her hands; for she had, passengers included, above 800 men on board; and when they found she began to open her lower tier of ports, and put out guns, which were thirty-six pounders at least, they durst not come near her any more, though there were three ships to one.

Thus, in case of a war, or of rovers and pirates, the Spaniards seem to judge right in sending great ships as the most secure (though the late Lord Anson took one of those *Acapulco* ships,) and their main end is answered hereby also; for two ships at this rate carry as many goods as twelve ships or more of 200 tons each would do; and it appears, the goods they bring amount to a very great quantity, and are of exceeding great value: for at their arrival they occasion a fair at *Acapulco*, as great in proportion as the fair at Porto-Bello, when the galleons from New Spain arrive there; and the merchants repair to *Acapulco* from Mexico, Lima, Cusco, and all the capital trading places of Peru, and even from Chili itself, to buy the rich goods they bring. This fair sometimes continues thirty days; and it is not one or two, nor ten or twenty ships only, that attend to carry off the goods, besides the great quantities that are carried upon mules and other beasts by land. So that during the fair, which is always proclaimed and appointed on that occasion, the town of *Acapulco*, which at other times is empty, and only inhabited by a few fishermen and mean people, is for that time so full, that it is scarce able to receive them, much less to entertain the number of people.

ACAPULTI or *ACAPALTI*, a plant of New Spain or Mexico, that bears the long pepper. Its trunk grows winding like that of the vine, and has leaves upon it like those of white pepper, but longer and more pointed, of a very strong scent, and a hot and pungent taste. The fruit is round, and from two to three inches long, of a pretty red colour, when near maturity, which it can never attain entirely on the plant; so that it is necessary to gather it, as soon as it begins to redden, in order to complete its ripening in the sun. This pepper is eaten either green or dried, and both ways gives a very high relish to meat, provided, that after seasoning therewith, it be not put again to the fire, in which case it loses part of its taste and strength.

ACARA, or *ACARO*, a territory and town of the kingdom of *Acambou*, on the coast of *Guinea in Africa*, long. 18. lat. 5. 40. Here the English, Dutch, and Danes, have each a considerable fort, which renders them masters both of the gold and negroe trade, and therefore obliges the French to deal with Lampi, Juda and Ardres, even when at war with these nations; the last of which borders on the kingdom of Boneri. Before Moure and Cormanteri had attracted the greatest part of the business transacted on the gold coast, the village of *Little Acara*, situated at the end of it, was the place where

where most of the European merchandizes found dispatch. This village alone furnished a third of all the gold that the Europeans traded for on this coast; and the negro trade is still pretty good here, as between three and four hundred may annually be purchased on reasonable terms. The commerce of Lampi and Juda, a small district or kingdom between Acara and Ardra, is not inconsiderable, especially for the purchase of negroes. In the years 1706 and 1707, the French Assiento company bought here two hundred and fifty each voyage, in truck for European goods from forty-five to fifty French livres per head, though in the kingdom of Ardres, from whence near three thousand slaves may be annually extracted, they cost about eighty ditto, and these with provisions, are the only articles of commerce in this kingdom for exports: the goods esteemed most here for truck, are the biggest glass beads; large crystal pendants, large gilt cutlasses; coloured taffeties; silk stuffs striped and spotted; fine linen; laces; fine handkerchiefs; buttons; iron bars; a fine thin woollen stuff called bouge; copper; cylindrical and pyramidal bells; long coral; copper basons of various fizes; muskets; brandy; large umbrellas; gilt looking-glasses; China taffeties, and other silks from that part; gold and silver dust; English and Dutch crowns.

ACARICABA, a plant of Brazil, whose aromatic roots may be reckoned amongst the best aperitives. It is used in obstructions of the spleen and kidneys. Physicians consider the juice of its leaves as an antidote and as a vomitive. This article may have two faults, that of saying too much of the properties of the plant, and of not saying enough of its characters.

To ACCÉDE to a contract or treaty, is to give one's consent to a contract or treaty already concluded and stipulated between two other persons, or a greater number. In this sense it is said, the States General have *acceded* to the treaty of Hanover; the Czarina has *acceded* to the treaty of Vienna. See TREATY.

ACCEPTANCE, a term in the traffic of inland and foreign bills of exchange.

The *acceptance* of a bill of exchange, is the subscribing, signing, and making a person debtor for the sum of its contents; by obliging him, in his own name, to discharge it at the time mentioned therein.

The *acceptance* is usually made by the person upon whom the bill is drawn, when it is presented to him by the bearer.

Bills payable at sight are not accepted, because they must be paid on being presented, or else protested for want of payment. There are some *acceptances* that need not be dated, and others that it is necessary to date.

The *acceptances* which need not be dated, are those upon bills payable at a day fixed, at usance, or double usance, &c. Upon these the word accepted ought only to be wrote, and the acceptor's name; dating being of no use in them, because they are always to run to the day mentioned for their payment. And the time for the bills at usance, double usance, &c. begins from the day of the date of the bills themselves.

It is not absolutely necessary to have bills of a fixed day, at usance, double usance, &c. accepted, because their time is always running: it is, however, an advantage to the bearer to have them accepted, because, by virtue of the *acceptance*, he has the security of two instead of one, the acceptor and the drawer.

If the person upon whom a bill is drawn, at a day fixed, or single or double usance, &c. should make difficulties to accept it, the bearer has a right to have it protested, for want of *acceptance*, and to return it to the drawer, in order to oblige him, either to cause it to be accepted, or to give security (in case it should not be paid, when due, by the person upon whom it was drawn) to return and restore the sum mentioned in it, with the difference of exchange, re-exchange, and the charges of the protest.

The *acceptances*, which it is necessary to date, are those drawn at a certain number of days sight, because the time does not begin to run till the next day after that of *acceptance*. This kind of *acceptance* is made thus, "accepted such a day and year," and signed. If the bearer of a bill of exchange consents to an *acceptance* at twenty-one days

sight, for instance, instead of eight days expressed in the bill, he runs the risque of the twelve days of prolongation, in case the acceptor happens to break in that time; and the bill remains to his account, without any recourse against the drawer. If a bill was drawn for three thousand pounds, and the bearer should think fit to take an *acceptance* for two thousand only, and should receive no more than that sum, the remaining thousand would be at his own hazard, as well as in the case of prolongation of time.

These examples may be sufficient for *acceptances* of this kind. It is, however, not amiss to observe, that if the bearer of a bill should have written orders from the drawer, to have the same accepted in either of the manners as above, in such case, the bearer would have undoubtedly a right against the drawer, for an indemnification.

In general, he to whom a bill is made payable, at the time should demand *acceptance* thereof, both for his own and the drawer's security, and, on refusal of *acceptance*, to return it with protest.

The address of a bill of exchange is the directions signifying by whom, and where the payment shall be made when due, and to whom the possessor may apply, in case the party, who is to accept or pay, be not in the way.

He that has the bill may demand *acceptance* of the person the bill is addressed to; and, in case that person has no order or power to accept the same, the possessor may desire such person, if to be trusted, to send such bill to procure *acceptance*, or to return it with protest. This the person to whom the bill is addressed is obliged to do, otherwise the possessor may, before the said person, make protest for non-*acceptance*. If the possessor cannot safely trust the person to whom the bill is addressed, to procure *acceptance*; or if the drawer has not addressed the bill at all, the possessor must cause the bill to be sent to somebody, in whom he can confide, that lives at the place where the person resides on whom it is drawn, to demand *acceptance*, and, upon refusal, to protest.

When the remitter or possessor has no correspondent to send the bill to, who lives where the acceptant does, it is common to desire the drawer to send the prima bill, to procure *acceptance*, and return it accepted to the remitter or possessor. The drawer is not obliged to do this, yet he cannot well refuse it, if he be assured of the honesty of his correspondent, and that he will accept his bill.

In case the drawer does not in convenient time return the bill accepted to the remitter, the drawer is not obliged to give further satisfaction to the remitter, but the remitter must look to it himself, and send a second bill to some other, to procure *acceptance*, and to enquire whether the prima be accepted, or not; if not, the acceptant must accept the second bill, or a protest must be made for non-*acceptance*.

A cautious remitter will not leave a prima bill in the drawer's hands to procure *acceptance*, unless he is well assured of his worth and integrity.

When the possessor of such bill has no correspondent at the place where the acceptant lives, nor dare trust the drawer with it, it is usual for the possessor to advise the acceptant by letter that he has such a bill on him, and desire him to return answer, whether he accepts the same, to pay it at the time, or no: if he returns answer that he will not accept, nor pay it, or if he gives no answer at all, the possessor is obliged to carry or send the bill to that place, and there formally, by a notary-public, to demand *acceptance*; and, in case of refusal, to protest.

If the acceptant be an out-dweller from the place where the bill is to be paid, it is usual, when *acceptance* is demanded, to desire the acceptor to underwrite to whom he must apply for payment, when due.

When a bill is payable to order, by an out-dweller, and not to a certain person, and the acceptor has not ordered to whom the last party it is assigned to, shall address for payment when due, the possessor is obliged to give the acceptor timely notice to whom the bill must be paid, that the acceptor may, within the respite days, return an answer, and take care of the payment.

If the out-dweller remits, at the time appointed, to the possessor of his accepted bill, in other bills due at the same

same time with his bill, the possessor is not obliged to demand *acceptance*, and to get these bills paid, without provision allowed him. But when the acceptor directs him to any particular person for payment, the possessor is obliged to go to such party to receive his money, without provision.

An out-dweller having a bill remitted to him payable by an in-dweller, and the out-dweller desiring his acceptor at the day to send his money in specie, or to remit him the value in other bills, the in-dweller is not obliged to do this without allowance of provision.

If the possessor of a bill payable by an out-dweller does not get his money in time, he must order a public notary to protest for non-payment, which protest, though not made in the presence of the person, nor at the house of the acceptor, is valid, because the possessor of the bill is not obliged to protest against an out-dweller at his house or dwelling, nor to seek him out of the town where the payment is to be made.

If an out-dweller refuses *acceptance* when a bill is sent him, a protest may be made either at the house of the out-dweller by the possessor, or else at the place of payment. A letter from the person that demands *acceptance*, being produced to a notary, is sufficient to ground a protest upon, as also in case of non-payment.

Although the possessor is not obliged to seek payment of an out-dweller in any other place but where the bill is payable, and the drawer or acceptor hath addressed; yet, in case of non-payment, the acceptor or his effects are liable in any place where either can be found.

Should an acceptor of a bill of exchange fail or become insolvent after he has accepted a bill, the drawer of the bill will be obliged to pay the same, with re-exchange, provision, and charges to the possessor.

When the person, on whom a bill is drawn, understands that the drawer has failed before *acceptance* is demanded, he need not accept such drawer's bills, notwithstanding he may have promised to honour such bills, without indemnification from all and every one that shall make any demand thereof, whether it be the drawer, his creditors, trustees, or his principals, for whose account the draught was made, &c. &c.

Nor ought any one, on whom bills are drawn, accept them from an insolvent drawer, though the bill is dated before the insolvency is known, and the letter of advice bears the same date, whether it comes by the common post or not; because there is reason to suspect some fraud, and that both the bill and letter were antedated.

If A draws on B on account of C, and B before *acceptance* has advice that A has failed, B should not accept such draught, though he promised A he would; because C is not obliged to make good the value to B. And more especially so, if C advises B of A's failure, or on any suspicion hath forbid B's *acceptance* for his account, altho' he had ordered the *acceptance* thereof before.

On failure of a drawer, the acceptor is not obliged to give better security for payment; but the possessor must wait till the day of payment, before he can demand any thing of the acceptor; and then the acceptor is obliged to pay, though he accepted for the drawer's account, and has no effects of his in hand.

If an acceptor refuses payment of a bill, on failure of the drawer, the possessor is not obliged to return the bill and protest, to the place from whence it is drawn; it being apparent, that the charges of re-exchange cannot be recovered of the insolvent drawer. The possessor therefore must without delay, after a protest is made, proceed by attachment: for a difference in conduct is required when the drawer maintains his credit, and when he has failed.

When an acceptor fails or absents himself, the possessor is obliged to get a protest made by a public notary, and send the same, with the bill, to the remitter, to procure satisfaction from the drawer; and advice should be given directly to the first remitter, and not to the last indorser only, that the drawer may, if he pleases, order some other to honour his bill, and prevent loss by the re-exchange, &c.

Though a possessor through ignorance of custom, or of the acceptant's failure, or by reason the bill did not come to hand till after due, or for any other cause of the

like nature, does not, or cannot make protest, by a public notary; yet this will not hinder the possessor's redressing himself on the drawer and indorser, though the acceptor failed before the bill became due.

When an acceptor fails before the day of payment, if the bill be payable to order, the possessor must not get a protest made, and send it to the first remitter, but keep the bill till it falls due, that if the drawer orders any other to honour his bill in time, the possessor may be ready to receive the value.

If any other offer to accept and honour a bill, whose first acceptor is failed, in favour of the drawer, or any other indorser, the possessor is not obliged to accept such offer, if he disapproves the offerer; but if the offerer is a sufficient man, or will give security, the possessor cannot refuse such an offer.

It is not safe to accept a bill, whose first acceptor has failed, without a protest for non-payment, declaring the bad circumstances of the acceptor; and such an acceptant, in honour, must presently send the said protest, together with the notary's attestation of his accepting the same in honour, to the drawer, or to him for whose account he has accepted the same. *Acceptance* after the day of payment past is usual and good. L. Raymond 364, 574. So *acceptance* for the honour of the drawer. Idem 575.

Where a merchant hath accepted, and, before the same became due, becomes insolvent, or at least his credit publicly blasted, a protest ought to go; but then there is usually a demand made, which once coming, the drawer is compellable to give better security; and if a second bill comes, if no protest, then drawer and security lie at stake.

If a bill be accepted, and the party dies, yet there must be a demand made of the executors or administrators; and, in default or delay of payment, a protest must be made; and although it may fall out, that the monies may become due before there can be administration, or the probate of the will be granted; yet that is delay sufficient for a protest, in case of non-payment.

N. B. Fourteen days are allowed from the death, before administration can be committed, unless there be a will.

But, on the other hand, if the party be dead to whom the monies are made payable, and the monies are ready to be paid, and there is no person that can legally give a discharge, yet a protest ought not to go for non-payment; the reason is, because there is no person that hath any authority either in deed or in law to make it, and a notary ought not to make it: if he does, and the party receives any prejudice thereby, an action of the case perhaps may lie against him for his pains: nor does it avail, that if the security be offered to save him harmless against the executors or administrators, for that is an act left to his own discretion; for perhaps the security may not be liked: but whether good or bad, makes nothing as to oblige him in law.

N. B. An intimation ought to go, and that the acceptor is willing to pay according to order.

If a bill of exchange be tendered, and the party subscribes accepted, or accepted by me, A. B. or being in the Exchange, says, I accept the bill, and will pay it according to the contents, this amounts, without all controversy, to an *acceptance*.

A small matter amounts to an *acceptance*, so there be a right understanding between the parties; as, "Leave your bill with me, and I will accept it," or, "Call for it to-morrow, and it shall be accepted." This obliges as effectually, by custom of merchants, and according to law, as if the party had actually subscribed or signed it, (which is usually done.)

But if a man shall say, "Leave your bill with me, I will look over my accounts and books between the drawer and me, and call to-morrow, and accordingly the bill shall be accepted;" this shall not amount to a complete *acceptance*; for this mention of his books and accounts was really intended to see if there were effects in his hands to answer, without which perhaps he would not accept the same; and so it was ruled by Lord Chief Justice Hale at Guildhall.

Where a bill of exchange is payable to A's order, that is, to himself if he makes no order, and if the

party underwrites the bill, viz. "presented such a day," or only the day of the month, it is such an acknowledgment of the bill as amounts to an acceptance; per *Holt*, Ch. J. and this by the jurors was declared to be common practice.

Acceptance by one partner binds both, unless accepted distinctly from the partnership.

Acceptance of a bill upon two by one partner, binds both, if it concerns the joint trade; but otherwise, if it concerns the acceptor only in a distinct interest and respect. *Pinkney v. Hall*.

Acceptance may be qualified.

A bill drawn by A on B, and B accepts it by indorsement thus, (I do accept this bill to be paid half in money, and half in bills) it was alledged that B's writing on the bill was sufficient to charge him with the whole sum; but it was proved by divers merchants, that the custom among them was quite otherwise, and that there might be a qualification of an acceptance; for he that may refuse the bill totally, may refuse it in part; but he to whom the bill is due may refuse such acceptance, and protest it, so as to charge the first drawer; and though there be an acceptance, yet after that he has the same liberty of charging the first drawer, as he had before. *Petit v. Benson*.

There may be a partial acceptance of a foreign bill.

Action upon the case, upon the custom of merchants, brought by a person to whom a foreign bill of exchange is made payable, against the acceptor. And the defendant sets forth, that one *James Collet*, being a merchant residing at *Christiana in Norway*, according to the custom of merchants, drew his first bill of exchange upon the defendant, requesting him to pay the plaintiff such first bill (his second not being paid) of one hundred and twenty-seven pounds, fifteen shillings and four-pence, which bill was afterwards, viz. December 1717, shewn to the defendant, who accepted to pay one hundred pounds, part thereof, upon the 8th day of February following, by virtue whereof he became chargeable, *et in consideratione inde die et anno ultimo supradictis super se assumpsit*, to pay the same on the said 8th day of Feb. tunc. prox. sequentem, which he has not done according to his undertaking. There is likewise a count for monies had and received, and an *infirmul computassent*. The defendant, as to these two counts, pleads *non assumpsit*, and as to the count upon the bill, he pleads, that the said *James Collet* drew another bill for one hundred pounds only, wherein he countermands the payment of the odd twenty-seven pounds, eighteen shillings, and four-pence, by virtue whereof the defendant paid the hundred pounds in satisfaction of the first bill, and the plaintiff accordingly received it in satisfaction. The plaintiff, *protestando*, that the defendant did not pay it in satisfaction, for plea faith, that he never received it in satisfaction; and to this replication defendant demurs.

Strange, pro defendente. I shall not trouble the court with an exception which has formerly been taken to these replications, that the payment in satisfaction being admitted, the traverse of the acceptance is immaterial; for I am sensible it has been adjudged to be well enough in the case of *Young v. Ruddle*, and of *Harvshaw v. Rowlings*, in this court, *Hill*. 3d of his late majesty, upon this ground, that there can be no payment in satisfaction, without an acceptance in satisfaction; and therefore a traverse of the acceptance is an argumentative denial of the payment; for if the plaintiff did not accept it in satisfaction, the consequence of that is, that it was not paid in satisfaction.

Laying therefore the plea and replication aside, I shall take up the case as it stands upon the declaration, and upon that offer some things distinctly, both as to the matter, and as to the manner of it.

As to the matter of it, the case is no more than this: the person to whom a foreign bill of exchange is made payable, brings his action against the drawer, upon a partial acceptance for so much of it as he undertook to pay, and counts upon the custom of merchants.

The single point which will arise upon this case is, whether a partial acceptance be good or not within the custom of merchants? and I shall endeavour to prove, that this acceptance is a void acceptance, and consequently the plaintiff has no cause of action.

That I may not be misunderstood when I call this a void acceptance, I would premise, that I do not mean, it is so absolutely void as to exclude any remedy against the acceptor, for I must admit, that this acceptance will create a contract between the parties, upon which an action upon the case would have laid. But what I shall insist upon is, that this is a void acceptance within the custom of merchants, upon which the plaintiff has founded his case; and if it be void within the custom of merchants, then, whatever effect it would have as a private contract between the parties, will be a matter foreign to the present question, inasmuch as the plaintiff has not relied on it as such, but has brought his action upon the custom.

I have enquired into the practice of merchants in this case, but have not been able to get any certain account of this matter. The true reason of which I apprehend to be, that it is a case which seldom or never happens amongst merchants, for they honour one another's bills, though there are no effects of the drawer's in their hands; and they would esteem it the greatest blemish that could be cast upon them, if their correspondent should once refuse to answer their bills, any further than he had effects in his hands.

What account I have received I shall submit to the court. Some are of opinion, that an acceptance for part is an acceptance for the whole, inasmuch as it deprives the party of the benefit of protesting, and for resorting back to the drawer; but I apprehend there is no reason at all for this. To say that because commonly a man does honour another's bill beyond what effects he has in his hands, that therefore he must do it, is a strange conclusion; for suppose he has but twenty pounds of the drawer's in his hands, and is bound to answer a bill for so much, it would be highly unreasonable, that in case the other should draw for ten thousand pounds, this man must either pay the whole, or subject himself to an action for non-performance of the condition.

But if this notion should prevail, then an acceptance for part is an acceptance for the whole; yet on the one hand as it charges the acceptor with the entire sum, so on the other hand it discharges him of this action; for then there can be no colour to split the demand into two actions, but the plaintiff in declaring for part ought to shew that the rest is satisfied. *Salk*. 65.

Others are of opinion, that the party ought not to have taken this acceptance, but protested the bill as to the whole, and sent for another, to the value of what the drawer would answer. This likewise makes for the acceptor, the defendant.

I am informed indeed, there is one gentleman who intends to say, that this matter has happened in his own experience; but he, by what I find, is alone in that opinion, and perhaps may not have considered the consequences of it.

As there is this diversity of opinions upon a matter which seldom or never comes in practice, I shall take it upon the reason of the thing, with a view likewise to the many inconveniencies which will follow as a consequence of establishing this partial acceptance.

The better to come at this, it may not be improper to state the method of transacting these affairs. When the party, to whom a bill of exchange is made payable, receives it, he immediately applies to the drawee to get his acceptance: if he accepts it, nothing further is done till the day of payment, and then, if it be paid, the matter is at an end. But if the drawee will not accept it, then the party is to protest the bill, and send back the protest by the next post. When the time of payment comes, he tenders the bill again, and then the drawee may either pay or refuse it; if he refuses it, then there is a second protest for non-payment, and the bill itself is returned; and so it is if he accepts it, and afterwards refuses to pay it. From all this I would infer, that there can be no partial protest for non-acceptance, which, as I am informed, is a protest not in the memory of any but one of the notaries public. The words of all protests are, "I ex-

hibited

hibited the original bill to the person to whom it is directed, and demanded his acceptance thereof." Now an acceptance of part is not an acceptance thereof, no more than payment of part is a payment of the whole. There is a book which goes by the name of "Advice concerning Bills of Exchange," and is esteemed amongst those who are most conversant in these affairs. And in fol. 33 of that book, it is said, that nothing but an acceptance to pay *secundum tenorem billæ*, can deprive the party of the benefit of a protest. And in fol. 16 of the same book, he puts the case of a bill drawn on A and B, who are not joint-traders, and an acceptance by one only. This, says he, goes for nothing, and the party must protest the bill, as in case of no acceptance. These are the words of the book, and by putting the case of two who are not joint-traders, I should apprehend he means, that each being charged with a moiety, the acceptance of one is but an acceptance to pay a moiety, which is but a partial acceptance, and therefore void. And this is explained by the case of *Pinkney v. Hall*, where one joint-trader accepted a bill, and it was held to be the acceptance of both, because both were equally liable to pay the whole. And to this purpose likewise is *Molloy de jure maritimo*.

If there can be no protest for non-acceptance of part, I would consider how the case would stand in regard to allowing this partial acceptance. The natural and plain consequence of that will be, to put it in the power of the drawee to defeat the other of the benefit of protesting a bill for ten thousand pounds by his acceptance to pay one penny only; for this I would submit, that if the party may take such an acceptance, he must take it: if it will be good, he cannot refuse it, for it is not at his election to charge the drawer but upon the other's default: the drawee is the person he must first resort to, and if he refuses, then, and not till then, there is a proper remedy against the drawer; and therefore in the action against the drawer, the plaintiff must shew a protest, which is an endeavour to receive the money of the drawer. *Salk. 131.*

But even admitting there may be a partial protest for non-acceptance, yet the inconveniencies which will follow of course are so great, that I hope it shall never be established by the court.

It would be endless to put cases where it has been held, that rent-charges and the like cannot be apportioned; and therefore I shall rely entirely upon the reason of the thing, that in this case the contract between the drawer and the person to whom the bill is payable is entire, and not divisible. By this contract the drawer, (and consequently the indorser) subjects himself to an action, if the money be not paid at the time: but though he becomes liable to one action, yet there is no reason, that by transactions between the party to whom the bill is payable, and the drawee, to which he is not privy, this contract shall be branched out into several actions, which will unavoidably be the case of every partial acceptance; for I do not apprehend how this can be reduced to one action by refusing this partial acceptance, and protesting for the whole; because (as I observed before) if the party may take it, he must take it, and can charge the drawer no further than there is a default in the drawee.

As therefore two actions are the fewest he can be charged with, I would beg leave to instance how he may be charged with a great many. The acceptor will charge him as far as his undertaking; then another for the honour of the drawer (as it is usual amongst merchants) may undertake for another part, and by the same reason a third, and a fourth, and no body can say where it shall stop: so many different persons may accept for so many different pence, and every one of these has his distinct remedy against the drawer.

This is too great an inconvenience to be got over, and it is such an inconvenience (I mean the multiplicity of suits) as the common law has always endeavoured to meet with. In the case of *Hawkins v. Cardee*, it was held, that the indorsee of part could have no action, because, says my Lord Chief Justice *Holt*, the drawer having only subjected himself to one action, it cannot be divided so as to subject him to two. If the grantee of a rent-charge levies a fine of part, the consuee cannot

compel an attornment, for that would be to give two actions against the tenant. So if a feoffment were made to a man and his heirs with warranty, and he makes a feoffment to two, the warranty is gone. If two take lands jointly with warranty, and one makes a feoffment, the warranty is gone as to him, but remains as to his companion, so as he may vouch for a moiety; and at common law, if they had made a partition, the warranty was lost. *Co. Litt. 187. a.* And all this goes upon that ground, that it being *res inter alios acta*, it shall not turn to the prejudice of a third person. But this partial acceptance is a matter transacted between mere strangers, and therefore shall not hurt the drawer, who was no party to it. No act of theirs, which would be prejudicial to him, shall bind him; but the subjecting him to several actions will be a prejudice; therefore he shall not be subjected to several actions.

The great benefit arising to the public from these bills is, their being negotiable, and passing about as well as money; for every body is sensible, that without the assistance of these bills, our trade could never be carried on for want of sufficient specie; not to mention the trouble and danger of returning money, which is avoided by this expedient. It is this benefit which the public receives from these bills, that has entitled them to all the favour they have received, of which innumerable instances might be given; for this reason it has been held, that the bare drawing or accepting a bill makes a merchant for that purpose. Now if what is contended for on the other side should prevail, the public will be deprived of this great benefit; for no man will take his bill as so much money in the way of trade, when he is to resort to one man for one part, and perhaps send out of the kingdom for the other, to a place where he has no correspondent. In the case of *Jocelyn v. Laferre*, which was in this court, *Hill. 11. Ann. rot. 214.*, where the bill was to pay out of my growing subsistence, it was held, that in regard his growing subsistence might never amount to the sum drawn for; therefore this was not a bill of exchange within the custom of merchants, for nobody would take it upon such a contingency. And the cases of promissory notes, since the statute 3 and 4 Ann. c. 9. made perpetual by 7 Ann. c. 25. have gone upon the same reason. *Smith v. Boheme, Mich. 1 Geo. in B. R.* which was to pay money, or surrender a man to prison. And the case of *Appleby v. Biddle*, in B. R. *Hill. 3 Geo.* which was to pay so much to A, if I do not pay so much to B, and both these were held not to be within the statute, upon that only reason, that they were not negotiable.

Another inconvenience which naturally occurs upon this occasion is, that the drawee will insist to have the whole bill delivered up, when he pays but a part only. For according to the authors who treat of this subject, he can never charge the drawer, when they come to make up their accounts, with more than he has vouchers for under the hands of the drawer. In *Lex Mercatoria* 274, it is said, that if the bill be lost, the drawee cannot justify the payment, though he has a letter of advice. And this refutes all the expedients of indorsing part, or giving a special receipt for so much; because in neither of those cases will the drawee have any authority to produce under the hand of the drawer. If the drawer then refuses to allow what the other has paid, his only remedy will be to bring his action; and how he will be able to maintain it upon the custom of merchants, I must confess myself at a loss to find out, for he will want the necessary evidence to maintain such an action, which is the bill itself that was drawn upon him.

If this then will be the case, where he pays the money without taking up the bill, I must contend, that by all the rules of prudence and justice, he may insist to have the whole bill delivered up to him, when he only pays part of it, a cording to his acceptance.

Supposing him then in possession of the whole bill, I would consider in what a condition we have left the party to whom it was made payable. He must be supposed to have advanced a consideration adequate to the whole sum, and consequently is in justice intitled to his whole money of somebody or other. It will be said, that he may get what he can of the drawee, and then go back

to the drawer for the residue. It is true he may do so, and the drawer may be a man of so much honour as to pay him every farthing. But what must he do when he finds he is mistaken in his man, when the drawer, (instead of ordering him the money as he expected) shall tell him, "No, you have nothing to produce under my hand, and if you have been so foolish as to deliver up the bill, you must take it for your pains." I know of no remedy in this case, but what would be worse than the disease, and therefore the most prudent thing he can do will be to sit down by the loss. And this will be so far from being a trick in the drawer, that it will be no more than what every prudent man will do. For if upon the report of what has been done he should advance the residue of the money, yet still there is a bill standing out against him for the whole, upon which bill it cannot appear he has paid the money which the drawee had left unpaid. And whether in that case he would not afterwards be answerable for the whole, may be proper to be considered.

I have now done with what I had to offer in maintenance of the negative of the question I proposed to speak to, and shall therefore proceed to take notice of what was hinted at upon the former argument in behalf of the plaintiff in this case.

It was said, that the drawee may, (and very often does) accept to pay the money at a different time from what is appointed in the bill. I must admit he may do so; but surely that case can bear no proportion to this. It is not liable to any of the inconveniences I mentioned; it is the same as if the bill had at first given him a longer time; and it is well known that after *acceptance*, a month or two will break no squares, where the man is good. With this further, that amongst merchants such an *acceptance* is esteemed a general *acceptance* to pay the money, according to the tenour of the bill; besides *Molloy* says, that in such a case the bill must be protested, which cannot be done in our case.

It was further urged to be highly reasonable, that the drawee should honour the bill as far as he had effects. I admit this to be reasonable, and perhaps it would not have been impossible for the plaintiff to have declared in such a manner, as to have charged the defendant to the amount of his *acceptance*. But we are upon the custom of merchants, and whatever might be reasonable in case of private property, will cease to be so, when it appears to be pregnant of so many inconveniences to the public as I have mentioned. And if the plaintiff has it in his power to frame a case wherein he may do himself justice, that makes the argument stronger against suffering him to break in upon the public convenience for his private benefit. The policy of the law is, rather to let one man suffer, than produce a general inconvenience. But here we are to be led into the greatest inconveniences, even in a case where there is no danger of the party's suffering in the least; for he has a remedy which stands clear of all these inconveniences, and there will be no harm in leaving him to that.

It was said, that if the drawer (who is supposed to know what effects he has in the other's hands) by drawing for more, subjects himself to several actions, it is his own fault. The answer to this is, that the very drawing for more destroys the presumption that he knew how the accounts stood. But amongst merchants, as I observed before, that is not the case, for they often honour one another's bill, where there are no effects at all.

But even admitting the drawer does not stand altogether clear of this objection, yet still this may be the case of one who cannot be supposed to know how the accounts stood between the drawer and the drawee; for it may happen this bill may be indorsed, and then the indorser is to be charged in the same manner as the drawer. The indorser will be liable to several actions, though he is no ways privy to any of the transactions between the indorsee and the drawee.

Upon breaking the case upon the former argument, a difference was taken between the case of the *acceptor* and that of any other person; that he should not come and discharge himself against his own *acceptance*, whatever the other might have done, as to refusing this partial

acceptance. If this was his case only, it might be reasonable to extend this *acceptance* as far as it will go; but the hardship is, that what is law in his case, must likewise be law in the case of the drawer and indorser; so that here are two innocent persons who are to be involved in the same common fate, and that is never to be suffered, especially when the drawee may be charged in another manner, which will not effect the drawer or the indorser.

But if this partial *acceptance* should be thought good within the custom of merchants, yet the plaintiff can never recover in this action, in regard to the manner in which he has declared.

My first exception is, that the plaintiff by his own shewing has brought his action too soon. This is a declaration of last Michaelmas term, and the *acceptance* is laid to be the 9th of *December* 1717, to pay upon the 8th of *February* following, in consideration whereof he did, the same day and year last mentioned, which was the 8th of *February* 1717, promise to pay the money on the 8th of *February*, *tunc proxime sequen*. Now there must of necessity be the intervention of a whole year between the 8th of *February* 1717, and the 8th of *February* following, and there the case is no more, than that the plaintiff complains, that the defendant on the 23d of *October* had not paid him a sum of money, which, of his own shewing, was not become due till the 8th of *February* following. If it were necessary to cite cases in maintenance of this acceptance, there are *Sid.* 373. *Vent.* 135.

Another exception is, that the plaintiff has not made any request before bringing the action, which he ought to have done; for the merchant who accepts is easy to be found, but the party to whom the bill is made payable may only be a traveller, to whom the other cannot resort to pay the money. And this differs from the case of a bond; for there it is for the benefit of the obligor to save the penalty; so there needs no request to him, to do an act for his own benefit. It will be said, that the action is a request; but if it be, still it recurs to that question, whether a request at the time of bringing the action is sufficient; and it is plainly not so, for then it is a request to pay the money four months before it became due.

I shall trouble your lordship with but a word more, and it is this. The bill runs thus, "Pay this my first bill, my second not being paid," and therefore I must submit it, whether they ought not to have averred, that the second was unpaid. Indeed in the case of *East v. Effington*, it was held well after a verdict, because if the second was paid, the jury could not find *assumpsit* as to the first; he was not to pay the first, unless the second was paid; so the jury finding him bound to pay the first, that is an argumentative finding the second unpaid. But the court in that case inclined, it would have been ill upon a demurrer.

It will be said, that this should have been shewn for cause of demurrer; but this exception goes to the cause of action itself, and may as well be taken advantage of upon a general demurrer as the want of setting out an attornment was in the case of *Long v. Buckeridge*.

The whole, both with relation to the matter and the manner of this deed, may be reduced to this dilemma; either this partial *acceptance* is good, or it is not. If it is good, yet the plaintiff has come too soon, without alleging what is necessary to make out his case, and consequently can never recover in this action: if it is not good, that alone will be sufficient to entitle us to judgment for the defendant.

Reve, contra. I am no otherwise prepared to argue this cause, than by acquainting the court, that a gentleman has often attended to inform you, that it is practicable to protest a bill for non-*acceptance* of part, and then resort back to the drawer. As to the inconveniences which are urged, they are as great on our side, upon account of death or acts of bankruptcy. The drawee is not prejudiced; and as to the drawer, if part is paid, his debt is so much lessened, which is a benefit to him.

As to the first objection to the declaration, that we have brought our action too soon, it runs, *in prædict.*

Novum diem Febr. tunc proxime sequentem; so to support the defendant, you will neglect *proxime sequentem*, and then it stands, as a promise to pay in February 1717, and the action is in October following.

2. No request was necessary; for upon the acceptance a duty arises, and this is not a collateral promise.

3. If the defendant had paid the second bill, he should have pleaded that matter in his discharge; and as to the case of *East v. Effington*, that was against the drawer upon the first contract, but this is against the acceptor upon a new contract.

Strange replied, As to *prædict.* it does not make the sentence inconsistent with *proxime sequentem*; for it is common to call the same day in a different year, the same day generally; and here it is no more than that the party promises on the 8th of February, in one year, to pay upon the same day in another year; and where a thing is grammatically right, the court will never reject it. It was held in the case of *Wyat v. Aland*, in B. R. Trin. 2 Ann.

They should have shewn the second bill unpaid, for it is in the nature of a condition precedent to their having any right to this action. As to the request, no debt arises upon the acceptance; for an *indebitatus assumpsit* will not lie upon a bill of exchange. *Salk.* 125.

Powis, justice. Either party might have refused this partial acceptance, and they were at the same liberty to take it: neither could force the other to it; but if both agree *volenti non fit injuria*. The drawer trusts all to the discretion of the person to whom he gives the bill; and if that person leads him into inconveniences, who can help it?

Eyre, justice. I think the declaration is well enough; we will reject *proxime sequentem*, and then all is right; there is no difference between the drawer and the acceptor; for if he pays either of the bills, the drawer is not liable. Acceptance of one is so of both, though in fact it amounts to no more than an acceptance to pay the contents of one of them; and payment of one is a discharge of both: so that the averment that the money was not paid upon the first goes to the second also. I searched, but could not find the record of *East v. Effington*; and by my notes, I find it went off immediately upon the answer that the verdict had cured it. The precedents are as this declaration. *Vidian Ent.* 31, 67.

Fortescue, justice. I think there is a difference between the drawer and the acceptor; for the drawer is bound to pay all, the drawing being an actual promise; but the acceptor is bound to pay but one, and no action can be maintained but upon the very note which he accepts. There is another answer to the objection, that the action is brought too soon; and that is, that the plaintiff needed not set out any promise at all. *Starke v. Cheefeman*. *Lowther v. Conyers*, which was a promissory note; and they have left out *supra se assumpsit*; and yet it was held well enough, for the law raises a promise. And this is likewise an answer to the want of request. In *Molloy*, and the other books, there is a whole paragraph about the partial acceptance of a bill of exchange, and they allow it to be good. So judgment was given for the plaintiff. *Wegerloffz* and *Keene*.

What acceptance amounts to a general promise.

Acceptance after the time of payment elapsed, and a promise then to pay the money *secundum tenorem billæ præd.* is good, and amounts to a promise to pay the money generally. *Mitford v. Wallicot*.

What amounts to an acceptance.

If a bill be drawn on one at Amsterdam, and he does not care to accept it, but gets one here to do it, the party need not acquiesce; but if he does, the party here is bound. *Per cur.* Same case.

Executor must prove acceptance to be in the testator's life-time.

A bill of exchange was directed to A, or in his absence to B, and began thus: viz. "Gentlemen, pray pay." The bill was tendered to A; who promised to pay it as soon as he should sell such goods. In an action for non-payment, it was objected that this was a condi-

tional acceptance; but here the action being by an executor, and upon debt laid to be due to testator, *Holt*, chief justice, held it necessary to prove that the acceptance was in the testator's life-time.

Acceptance may be by parole.

A bill of exchange may be accepted by parole, but not transferred, otherwise than by writing on the back, and that transfers the property by the custom of merchants. *East v. Effington*.

What acceptance good.

A foreign bill was drawn on the defendant, and being returned for want of acceptance, the defendant said, that if the bill came back again, he would pay it; this was ruled a good acceptance. *Car v. Coleman*.

The drawee wrote a letter to him in whose favour the bill was drawn, that if he would let him write to Ireland first, he would pay him; and this was held a good acceptance. *Wilkinson v. Lutwich*.

Acceptor may plead statute against gaming.

Acceptor of a bill drawn for a sum won at gaming more than the statute allows, may plead the statute against gaming against the person himself, but not perhaps against any indorsee for value received. *Hussey v. Jacob*.

Acceptance after a bill becomes payable.

It was agreed that an acceptance, or negociation, in England, after a bill becomes payable, shall bind the acceptor, or indorser, though not perhaps the original drawer. And for this was quoted *Pigot and Jackson's* case in B. R. Hill. 9 William III. though it were an acceptance to pay *juxta tenorem præd.* as here agreed. *Mitford v. Wallicot*.

Custom of acceptance laid too general.

In case, upon a bill of exchange, the plaintiff set forth a custom, *inter mercatores & alias personas*, that if a bill is indorsed, and accepted by a person on whom it is drawn, if any other merchant will pay the money to the indorsee, for the honour of the indorser, there the first drawer is chargeable to him; that F, the defendant, drew a bill upon J. S. for one hundred pounds, payable to J. D. that J. S. accepted the said bill, and J. D. indorsed it to M. L. and that R. the plaintiff, paid the money to M. L. for the honour of the said J. D. the indorser; and that thereupon F, the drawer, became liable to him, but had not paid the money, *ad damnum*, &c. the plaintiff, had judgment by *nil dicit*, &c. but it was reversed upon a writ of error in the Exchequer-chamber, because the custom was laid too general; for it extended not only to merchants, but to all other persons whatever. *Fairly v. Roch*.

Acceptance for the honour of the drawer.

R drew a bill of exchange on S payable to B; S refused to accept it, whereupon B protested it. L, for the honour of R, gave a note to pay the money at the day, if not paid by R: afterwards B indorsed L's note to C, for value received: C, in like manner, indorsed it to D, and he to E, and he to F, all for value received. At the day of the return, S still refused to accept the bills; whereupon L's bill was protested. Then M and N, hearing of the protest of K's bill, paid the money for the honour of B, but in action by M and N, against L, the declaration does not say that they paid it to F, nor to whom they paid it; but only generally, that they paid it. This matter was assigned for error, and that, for what appears, it might be paid not to F, the last indorsee, to whom alone it was due, but to another; and if so, the defendant remains still liable as to him. But, *per cur.* after verdict, it shall be intended that the payment was to the right person, especially it being laid to the *ex parte* of the plaintiff; which could not be, if it had been paid to a stranger; and so the judgment of the King's Bench has affirmed in the Exchequer-chamber. *Brunetti versus Lewen*.

If A draws a bill on B, who will not accept it, and C offers to accept it for the honour of the drawer, the drawee need not acquiesce, but may protest; but if he does not acquiesce, C is bound *per cur.* *Misford v. Wallicot.*

A man cannot be sued on his acceptance of a bill of exchange abroad, after he has been discharged by the laws of that country.

A bill of exchange was drawn upon the debtor at Leghorn, which he accepted; but by the law there, if a bill be accepted, and the drawer fails, and the acceptor hath not sufficient effects of the drawer in his hands at the time of acceptance, the acceptance becomes void; and this happening to be the plaintiff's case, in order to discharge himself of the acceptance, he instituted a suit at Leghorn, and his acceptance was thereupon vacated by a sentence in that court. Afterwards the plaintiff returned to England, and was sued here at law upon this bill; and thereupon he exhibited his bill in this court for an injunction and relief.

King, lord chancellor, was clearly of opinion, that this cause was to be determined according to the local laws of the places where the bill was negotiated; and the plaintiff's acceptance of the bill having been vacated, and declared void, by a competent jurisdiction; he thought the sentence was conclusive, and bound the Court of Chancery here: and to this purpose he instanced the case of one *Hutchinson*, which was in 29 Car. 2. and is mentioned in *Sbo.* 6. where *Hutchinson*, having killed a person in Spain, was there prosecuted, tried, and acquitted of the murder; and afterwards returning to England, he was indicted again for the same murder here; to which indictment he pleaded the acquittal in Spain in bar, and the plea was allowed to be a good bar to any proceedings here.

And upon the attorney-general's insisting that the plaintiff might have taken advantage of this matter upon a trial at law, and therefore not relievable in a court of equity,

The chancellor declared, that if he was to try the cause at law, he would allow the plaintiff the benefit of this matter upon the trial. But as the other judges might be of a different opinion, he would not put the plaintiff upon the difficulty and hazard of a trial. And he said he remembered a case which came before him in the lord mayor's court, when recorder of London; where a mariner sued in the Admiralty Court for his wages, and his lordship, as recorder, being doubtful whether he should allow the defendant to give the sentence in the Admiralty Court in evidence upon *non assumpsit*, asked the opinion of chief justice Holt; who said, That whatever defeated the promise, might be given in evidence on *non assumpsit*, and that the sentence in the Admiralty Court would be good evidence: and in this case a perpetual injunction was granted, to enjoin the defendant from suing upon that bill. *Burrows v. Femino.*

Acceptor cannot set up forgery of the bill.

In an action by the indorsee of a bill of exchange against the acceptor, it was held not to be necessary to prove the hand of the drawer; and the plaintiff rested on the proof of the acceptance. The defendant offered to prove it a forged bill, by calling persons who were acquainted with the hand of the drawer, and would swear they did not believe it to be his hand. But the chief justice would not admit this, from the danger to negotiable notes, and because a man might, with design, write contrary to his usual method: and he strongly inclined, that even actual proof of forgery would not excuse the defendants against their own acceptance, which had given the bill a credit to the indorsee, who had a verdict. *Jenys v. Fowler et al.*

Action lies against a servant upon a bill drawn on him and accepted generally, though the order is to place it to the account of the master.

The plaintiffs were indorsees of a bill of exchange drawn from Scotland upon the defendants in these words: "At thirty days sight, pay to J. S. or order two hundred pounds value received of him, as per advice from Charles Milldway. To Mr. Humphrey Bishop,

cashier of the York-buildings company, at their house in Winchester-street, London.

Accepted 13 June, 1732, per
H. Bishop."

This bill not being paid, an action was brought against the defendant upon his acceptance: and the defendant proved, that the letter of advice was addressed to the company; and that the bill being brought to their house, he was ordered to accept it, which he did in the same manner as he had accepted other bills. But Mr. J. Page, who tied the cause, directed the jury to find for the plaintiff, which they did accordingly.

And now, upon motion for a new trial, the court held, that the direction was right; for the bill on the face of it, imports to be drawn upon the defendant, and it is accepted by him generally, and not as servant to the company, to whose account he had no right to charge it, till actual payment by himself; and this being an action by an indorsee, it would be of dangerous consequence to trade to admit of evidence arising from extrinsic circumstance, as the letter of advice. And they said, this differed widely from the case of a bill addressed to the master, and underwrote by the servant, where undoubtedly the servant would not be liable; but his acceptance would be considered as the act of his master. A bill of exchange is a contract by the custom of merchants, and the whole of that contract must appear in writing. Now here is nothing in writing to bind the company, nor can any action be maintained against them upon this bill; for the addition of cashier to the defendant's name, is only to denote the person with more certainty; and the York-buildings house is only to inform the order where the drawer is to be found: and the direction whose account to place it to, is for the use of the drawer only. And they compared it to the case in *Carth.* 5. 2 Vent. 307; where a bill was drawn payable to Price for the use of Calvert: and held, that the legal property was in Price: which is stronger than the present case. They said, it might be otherwise, if the action had been by J. S. who was privy to the transaction; and it had appeared he tendered the bill as a bill on the company: but this plaintiff being a stranger, they could not consider those circumstances. The plaintiffs had their judgment. *Thomas et al. v. Bishop.*

What acceptance of a bill of exchange is good.

The defendant accepted a bill of exchange to pay it when consigned to him, and when the goods, for which the bill was drawn, were sold; and the plaintiff counted upon the custom of merchants. After a verdict for the plaintiff, it was moved in arrest of judgment, that this acceptance, depending upon the contingency of the sale of the goods, was not within the custom of merchants, or negotiable. But the court, upon consideration, held it good: for though the plaintiff might have refused to take such an acceptance, and have protested the bill; yet nobody can say, he might not submit to it; and it will affect trade, if factors are not allowed to use this caution, when bills are drawn before they have an opportunity to dispose of the goods. A man who is drawn upon to pay at ten days sight, may accept for thirty. *Molloy* 304. Though the other might protest the bill. *Salk.* 129. *Cumb.* 452. *Smith v. Abbot.*

Acceptance to pay at a goldsmith's must be tendered within the same time a note must.

Case by indorsee of a bill of exchange against the defendant as acceptor, who, on tender of the bill, wrote, "Messieurs Caswal and Mount, pay this bill when due, for Thomas Chitty." The bill fell due on the second of January, 1741. The bankers paid till the ninth at two; and on the twenty-first of January, the money was demanded of the defendant.

For the defendant it was insisted, that the plaintiff had given such a credit to the bankers as to make it his loss; and they compared it to this common case of a note, or draught kept.

For the plaintiff it was said, that there was no limited time, but that of the statute of limitations, to sue the acceptor; and that the plaintiff cannot come in as a creditor

ditor of the goldsmith's, because they have done nothing to make themselves liable.

The chief justice held, that it was the loss of the plaintiff, who, though he might have refused to take such an acceptance, yet had now agreed to it; and it was to all purposes in the nature of a draught, which is always considered as actual payment, when a reasonable time to receive it in is elapsed. *Bishop v. Chitty*.

Acceptor being an infant not liable.

Assumpsit on the custom of merchants against the defendant as acceptor of a bill of exchange. The defendant pleaded infancy; to which the plaintiff demurred, alleging, that where contracts are established by custom, as in the binding one's self apprentice, infants shall be bound as well as others.

But by the court. Here the infant is not bound: the case of an apprentice depends on custom, but the law of merchants is part of the common law; wherefore judgment for the defendant. *Williams v. Harrison*.

An acceptance by letter good. Law of bills.

The bill was, for satisfaction of a bill of exchange, drawn upon the defendant, and accepted by him. Pending the suit, the original defendant died, and it was revived against his executors, praying also a discovery of assets, and to be satisfied thereout. On the proofs some question was made, whether the acceptance was sufficient to charge the defendant? and, whether the plaintiff, by keeping the note about ten days after it became due, without coming to the drawee for the money, hath not discharged the acceptor; but it was insisted for the defendant, as a previous matter, that the plaintiff had a plain remedy at law, that his case depended upon facts that ought to be tried by a jury, and not to be determined in this court.

Hardwicke, lord chancellor. Regularly the plaintiff ought to pursue his remedy at law, and not in this court: and, if the case stood as it did at first, I should certainly dismiss the bill: but the bill of receiver, praying a satisfaction out of assets, and a discovery of assets, it is made a case of which this court takes cognizance; and then the prayer of satisfaction is an incident that follows with it. I have therefore no doubt but that the plaintiff is proper in praying a remedy in this court. But, with regard to the acceptance, if there were a doubt of it, as to the fact, or whether in law what has been done amounts to an acceptance, it might be still necessary to send the parties to a trial at law; but I think there is no doubt of either. The testator, when the bill was brought to him, received it, entered it in his book, according to his course of trade; and the entry is proved to have been made under a particular number, and wrote that number under the bill and returned it. Now it is said to be the custom of merchants, that if a man underwrites any thing to a bill, it amounts to an acceptance. But if there were no more than this in the case, I should think it of little avail to charge the defendant. But what determines me, is the testator's letter; and I think there can be no doubt, but that an acceptance may be by letter; and it has been so determined: there was a doubt, whether a *parole-acceptance* be good; lord chief justice *Eyre* said it was, lord *Raymond* held the contrary; and there was a like case came on before me at *nisi prius*; *Lumely and Palmer*, 2 Stra. 1000. and I had a case of it for the opinion of the court, and it was several times argued, and at last solemnly determined, that such acceptance is good; much more therefore an acceptance by letter.

As to the plaintiff's being entitled to interest, I think it a clear case that he is, though no protest has been made; for that is necessary only to entitle the payer to damages against the drawer, and all the damage that can be had in such a case, is the interest.

Decree for the defendant to pay the note with interest, at the rate of four per cent. The plaintiff to pay the costs to the time of the bill of revivor, and after each party to bear their own costs. *Powell and Molire*.

Book-keeper, servant, &c. may accept a bill of exchange.

If a book-keeper, or servant, or other person, having authority, or usually transacting business of this nature

for the master, accept a bill of exchange, this shall bind such master.

Penalty of forging the acceptance of bills of exchange.

"If any person shall falsly make, alter, forge or counterfeit, or cause, or procure, to be falsly made, &c. or willingly act, or assist, in the false making, &c. any acceptance of any bill of exchange, with intention to defraud any person whatsoever; or shall utter or publish as true, any false, &c. acceptance of any bill of exchange, with intention to defraud any person, knowing the same to be false, &c. such person shall be deemed guilty of felony, without benefit of clergy." 7 Geo. II. c. 22.

See Bills of Exchange.

ACCEPTANCE of money where it discharges a bond. Debt upon bond; the defendant pleaded, that it was agreed between the plaintiff and the creditors of the defendant, that he should by indenture convey lands to the said creditors to be sold by them, and the money to be shared amongst them, and says *de facto*, that by indenture he sold the lands to them, and assigned to them a lease for years of certain customs of wines and sums of money, which they accepted; adjudged, that this indenture founds in nature of a covenant, the breach whereof must be satisfied by damages, which are uncertain, and shall not be accepted, or pleaded in satisfaction, yet, it not being performed, it shall be no bar, though accepted by the creditors. Cro. Car. 192. See 6. Rep. 34. Blake's case. Debt upon bond for the payment of 7l. upon the birth of the plaintiff's next child; the defendant pleaded, that before the birth of the child it was agreed between them, that the plaintiff should have a load of lime of the defendant; for which he would be indebted to him (the said defendant) and that he would acquit himself (the plaintiff) of the said debt, and the plaintiff accepted it in satisfaction of the bond; and upon demurrer it was insisted, that nothing could be taken in satisfaction of the 7l. because it was not a duty, but a sum payable upon a contingency, and that the lime could not be accepted in satisfaction of the bond, because the bond itself could not be discharged, without a specialty; and therefore he ought to have pleaded, that the plaintiff accepted it in satisfaction of the money mentioned in the condition, &c. And this last was adjudged a material exception. 2 Cro. 254. 1 Bulst. 66. 1 Brownl. 109. Yelv. 192. Debt on a bond of 100l. conditioned for the payment of 52l. 10s. on a certain day; the defendant pleaded, that at the day, &c. he and his son gave a new bond of 100l. conditioned for the payment of 25l. 10s. at another day then to come, which the plaintiff accepted in satisfaction of the bond; and upon demurrer, it was adjudged for the plaintiff, because the acceptance of a new bond to pay money at another day, could not be a present satisfaction for the money due on the day when it was to be paid on the old bond. Hob. 68. Debt upon bond, conditioned to pay 8l. &c. Defendant pleaded payment of 5l. before the day mentioned in the condition, which the obligee accepted in satisfaction of the bond; and upon demurrer this was adjudged a good plea, upon this difference, that where a less sum is paid before it is due, and the payment is accepted, it shall be good in satisfaction of a greater sum; but after the money is due, then a less sum, though accepted, shall not be a satisfaction for a greater sum, Moor 677. Debt upon a bond of 16l. conditioned to pay 8l. 10s. on a certain day; the defendant pleaded, that before that day, he, at the request of the plaintiff, paid to him 5l. which he accepted in satisfaction of the debt, and upon demurrer the plaintiff had judgment, because the defendant had pleaded the payment of the 5l. generally, without alleging, that it was in satisfaction of the debt. It is true, he sets forth, that it was accepted in satisfaction of the debt, but it ought likewise to be paid in satisfaction. 5 Rep. 517. Debt upon bond, conditioned that in consideration the plaintiff had paid 12l. to the defendant, he became bound to pay the plaintiff 12l. if he lived one month after the date of that bond; and if not paid at that time, then to pay him 14l. if he lived six months after the date of the bond; the defendant pleaded, that after the six months,

he paid the plaintiff 8l. and then gave him another bond in the penalty of 20l. conditioned to pay him 10l. on a certain day, in full satisfaction of the other bond, and that the plaintiff did accordingly accept the said bond; upon a demurrer to this plea, it was held ill; for admitting that one bond might be given in satisfaction of another, and yet it cannot be after the other is forfeited, as it was in this case; because after the forfeiture, the penalty is vested in the obligee, and a less sum cannot be a satisfaction for a greater. 1 Lut. 501. *Debt upon bond*, conditioned for payment of 50l. and interest, on the second day of March, 31 Car. II. the defendant pleaded in bar, that after the making the said bond, he entered into another bond to the plaintiff of the same penalty, conditioned for payment of the like sum, as in the first bond, which second bond the plaintiff did accept in full discharge and satisfaction of the first; and upon a demurrer to this plea, the plaintiff had judgment, because the defendant did not alledge that he gave the second bond in satisfaction of the first, but only that the plaintiff accepted it, &c. 1 Lut. 501.

ACCEPTOR, the person who accepts a bill of exchange by signing it, and obliges himself to pay the contents, when it becomes due. As long as the acceptor has his signature in his own power, that is, as long as he has not returned the bill with his name to it, he may strike out his acceptance: but, when he has once delivered it, it is no longer in his power so to do, though it should come again into his hands. In a word, there is no retracting an acceptance once delivered: the acceptor must pay the bill. Some use the word *acceptant*, which is the usual French term: though they also use the term *accepteur*.

It is the custom at Amsterdam, that all who accept bills of exchange make themselves debtors for them, by virtue of their acceptance; and though the drawers should become insolvent before the term for payment elapses, the acceptors can have no recourse against the indorsers of the bills. *Ordinances of Amsterdam*, quoted by Mr. Ricard, in his *Traité General du Commerce*, under the title *acceptances*.

ACCESSARIES to Piracy. All persons who shall, either on land or upon the seas, knowingly set forth any pirate, or assist, or maintain, procure, command, counsel, or advise, any person to commit any piracies, or robberies upon the seas, and such person shall thereupon commit any such piracy or robbery, all such persons shall be adjudged *accessary* to such piracy and robbery; and after any piracy or robbery committed, every person, who knowing that such pirate or robber has committed such robbery, shall, on the land, or upon the sea, receive, entertain, or conceal any such pirate or robber, or receive any ship or goods, by such pirate or robber, piratically and feloniously taken, shall be adjudged *accessary* to such piracy and robbery; and all such *accessaries* may be enquired of, heard, and determined, after the common course of the law, according to the statute 28 Hen. VIII. cap. 15. as the principals of such piracies and robberies ought to be; and being attainted shall suffer death, and loss of lands and goods.

By 8 Geo. I. ch. 24. § 1. if any commander of a ship, or other person, shall trade with any pirate, or shall furnish any pirate, felon, or robber, upon the seas, with ammunition, provision, or stores, or shall fit out any ship knowingly, and with a design to trade or correspond with any pirate, &c. upon the seas, or if any person shall consult, combine, or correspond with any pirate, &c. knowing him to be guilty of piracy, felony and robbery, such offender shall be adjudged guilty of piracy, &c. and shall be tried according to the statute Hen. VIII. cap. 18. and 11 and 12 Will. III. cap. 7. and being convicted shall suffer death, and loss of lands and goods; and if any person belonging to any ship, upon meeting any merchant ship on the high seas, or in any port, haven, or creek, shall forcibly board or enter such ship, and though they do not seize and carry her off, shall throw overboard, or destroy any of the goods, they shall be punished as pirates.

Every ship fitted out with a design to trade, or correspond with any pirate, and all the merchandizes put on board the same, with an intent to trade with any pi-

rate, shall be forfeited, one moiety to the king, and the other to the informer, to be recovered in the High Court of Admiralty.

All persons declared *accessaries*, by 11 and 12 Will. III. to any piracy, are by this act declared principal pirates. See **PIRATES**.

ACCIDENTS on board ships. As soon as merchandizes, or other commodities, are put on board a ship, whether she be riding in port, haven, or any other part of the seas, he that is *exercitor navis* (master of her) is chargeable therewith; and if the same be there lost or purloined, or sustain any damage, whether in the haven or port, before, or upon the seas, after she is on her voyage, either by the mariners or by any other through their permission, he that is the commander must answer the damage, for the very lading the goods aboard the ship subjects him thereto. And with this agrees the *common law*, where it was adjudged, 1 Mod. 85. Raym. 220. 1 Ven. 190. 238. 2 Keb. 866. 3 Keb. 72. 112. 132. 135. that goods being sent aboard a ship, and the master having signed his bills of lading for the same, the goods were stowed, and under pretence of being *prest-masters*, divers persons, in the night, entered the ship, and robbed her of those goods; the merchant brought an action at *common law* against the master; and the question was whether he should answer the same; for it was alledged on his part, that there was no default or negligence in him, as he had a sufficient guard, the goods were all locked up under hatches, and the thieves came as *prest-masters*, and by force robbed the ship; and that the same was *vis major* (sometimes allowed in the *civil law*) which he could not prevent: And lastly, that though he was master, or *exercitor navis*, yet he had no share in the ship, and was but in the nature of a servant, acting for salary. But notwithstanding, it was adjudged to the plaintiff; for the master at his peril must see that all things be forthcoming which are delivered to him, let what accident soever happen (the act of God, or an enemy, perils and dangers of the seas only excepted) but for fire, thieves, and the like, he must answer; and is in the nature of a *common carrier*; and that though he receives salary, yet is a known and public officer, and one that the law looks upon to answer; and the plaintiff hath his election to charge either master or owners, or both at his pleasure, though he can have but one satisfaction.

If a master shall receive goods at the wharf, or key, or shall send his boat for the same, and they happen to be lost, he shall likewise answer, both by the *marine* and *common law*. See **SHIPS**.

ACCIL, chemistry: some have made use of this word to signify lead. See **LEAD**.

ACCISE, a duty paid at Amsterdam, and in all the states of the United Provinces, for different sorts of merchandize and commodities, as wheat, and other corn, beer, peat or turf, and pit coal. The duties of *accise* on wheat are paid at Amsterdam by the rate of thirty sols the *last*, whether the corn is dear or cheap, besides the duties of entry, which amount to ten florins, exclusive of what the bakers and burghers pay for measuring, brokerage, and carriage to their houses.

ACCOLER, a term in the *French commerce*, importing the making a certain dash of the pen in the margin of a book, account, memorial, inventory, which specifies that several articles are comprehended in the same calculation, or in one only sum, which is drawn out at the margin on the side where the figures are placed that are to be summed up at the end of the page.

EXAMPLE.

Active debts, as well good as bad, due to me by the under-named.

Good.						
By James	-	-	-	-	300l.	} 500l.
By Peter	-	-	-	-	200	
Bad.						
By John	-	-	-	-	400	} 900
By Nicholas	-	-	-	-	500	
					Total	1400l.

ACCOMMODATION, is used both in matters of trade and of law, to signify a friendly agreement or composition between persons at variance, and is frequently brought about by the mediation of common friends, or by a partition of the things in dispute.

ACCOMPT, signifies, in general, all computations made arithmetically, whether by the addition of several sums, or by subtraction, multiplication, or division.

We *account time* by years, months, &c. *distances* by leagues, miles, poles, perches, &c. *weights* by tons, hundreds, quarters, pounds, ounces, drachms, &c. *long measure* by rods, ells, yards, &c. *liquid measure* by tuns, hogheads, pipes, barrels, gallons, quarts, &c. *dry measure* by quarters, bushels, pecks, &c. *money* by pounds, shillings, &c.

Money of account is an imaginary species, continued in several states, to facilitate the keeping of *accounts*; as nobles, angels, marks, were in England, mill-rees in Portugal, &c.

ACCOMPT is also used collectively for the several books which merchants, traders, and bankers keep, and in which they enter all their business, traffic, and bargains, with each other. Hence they say, *to make out an account, to pass accounts*, &c. All merchants in France are obliged to keep books of their *accounts*, and all bankrupts to deliver up theirs. See BOOKS OF ACCOMPTS, BOOK-KEEPING, &c.

These books are kept in the manner of *debtor and creditor*; that is, the *debit*, which is the receipt of the *account*, is wrote on the left-side, or page; and the *credit*, which is the expence, on the right-side, or page. The *debit* side is distinguished by the word Dr. (*Debtor*) which is placed at the beginning of the page, after the name of the debtor; and the *credit* side by the letters Cr. for *creditor*, which is placed opposite the other. The French, instead of the words *debtor* and *creditor*, use the words *doit* (owes) and *avoir* (to have).

There are three kinds of *accounts* absolutely necessary for closing books of double entries; namely, the *accounts* of stock, of profit and loss, and of balance.

The *account* of stock is the particular *account* opened on the debtor and creditor side of the ledger. It contains all the effects of a merchant; that is, his ready money, merchandizes, bills, promissory notes, bonds, contracts, *accounts* settled, real and personal estate, and all in general, that is his own, free and clear of all debts and mortgages.

This kind of *account* is sometimes closed on the debit, and sometimes on the credit side of the *account* of profit and loss. On the debit side, when the loss exceeds the profit; and on the credit side, when the profit exceeds the loss. The *account* of profit and loss is opened upon the ledger. It consists of all the losses and gains made by a merchant in his trade; the losses are written on the debtor, and the profit on the creditor side of the book.

This *account* is generally balanced annually, or when the books are to be closed, in order to the opening of new ones; or when the merchant intends entirely to leave off trade.

To balance the *account* of profit and loss, separate additions must be made of the debtor and creditor sides, and the lesser total subtracted from the greater, of which the remainder, if the profit exceeds the loss, is carried to the credit of the *account* of stock, and to the debit, if the loss exceeds the profit.

The *account* of balance is opened in the ledger, only for the closing of the books. When the books are to be finally closed, it is called the *account* of the final balance; but, when new books are to be opened, it has the name of balance of entry, or balance carried over.

In the final balance *account* all that is due to stock is carried to the debit, and all that is owing from it to the credit; and in the *account* of balance carried over, or of entry, all on the credit of final balance is placed to the debtor, and all on the debit to the creditor; the leaving off, or continuing of trade, making such reversed entries necessary.

The merchants and traders who keep their books by double entries, have one in particular, which they call the *book of accounts current*, wherein they enter copies of all the *accounts* which they make out and send to their

correspondents, in order to have recourse to it occasionally. This book, which is of the number of those commonly denominated auxiliaries, is ruled and kept in the same manner as the ledger. See BOOKS, &c.

Mr. Savary, in his *Parfait Negociant* (*Complete Merchant*) liv. iii. chap. 2. of the second part, lays down excellent rules for clerks, factors, or agents of merchants, or wholesale dealers in France, with respect to the manner of settling *accounts* with retailers, the substance of which is as follows, viz.

I. The clerks, factors, or agents of wholesale dealers ought to go to the houses of the retailers, to whom the merchandizes have been sold, to settle the *account* or bill with them as soon as possible, in order to avoid the difficulties which commonly arise, either with regard to the price, or the measure of goods; for, if that be delayed long, the memory easily fails.

II. In settling *accounts*, they ought to be very careful of what they are about; that is, they ought not to admit tare upon pieces of goods, before they have measured them themselves, in order to see whether they are right, and not to allow any out of complaisance, that being against their master's interest.

III. To settle an *account* regularly, they ought to make an extract from the journal or day-book, containing the numbers, the measures, and the prices, for which the goods were sold.

IV. Finally, in order to have the bill well drawn up, they must compare the extract they carry, with that which was delivered together with the merchandize, to see whether they agree; and upon each article they should set down the tare, if there be any, and the sum to which it amounts: and on their return to the warehouse, they ought to enter it exactly in the book itself, that there may be an agreement between their master's book, and that of the retailer with whom they have settled the *account*. This exactness keeps up the good understanding that should subsist between the merchant and wholesale dealer, and the retailer.

To open an ACCOMPT, is to enter it for the first time into the ledger. This is done by writing in large characters the christian name, surname, and place of abode of the person with whom an *account* is thus opened: afterwards the articles are posted to it, either on the debit or credit side, as affairs occur.

When an *account* is opened in the ledger for any one, his name must be entered at the same time in the alphabet, and the folio of the book set down, where the *account* is entered, for the more easily referring to it.

Merchants, who keep open *accounts* with each other, sometimes agree to honour the bills of exchange, which they draw reciprocally.

To post a sum to ACCOMPT, is to enter into the ledger, either on the debit or credit side, the articles for which persons become either debtors or creditors.

Counterpart of an ACCOMPT, is in the bank stile of France, and in that of the clerks of the offices of the king's farms, the register kept by the controller, wherein he enters and posts all the articles which the book-keeper, if for the bank, or the receiver, if for the king's farms, charges his book with.

Order of an ACCOMPT, is its division into three heads, of receipt, expence, and defalcation; that is, the deduction of such sums as are taken into the *account*, and not received or admitted. The French call it *reprise*.

To examine an ACCOMPT, is to read it exactly, to point the articles of it, and prove the computation, in order to know whether there be any errors, and whether the balance be right. *I have examined your account, it is right, there is nothing to except against it.*

To settle an ACCOMPT, is to cast it up, by calculating every article of it, and balancing the same. In the like sense are used the words to shut, to balance, to close, to make up an *account*. *Accounts* are balanced upon the ledger, on two occasions; the one, when traders settle or adjust affairs with some debtor or creditor, in order to know what is due to them: the other, when it is necessary to carry over *accounts* to some new folio in the same book, or into another, in order to continue them, for want of room in the former.

Prudent merchants ought to settle their *accounts* at the end of every year, in order to open new ones in the beginning of the next.

To place to ACCOMPT (*passer en compte*) is to give credit for a sum received, either of him, or for him. It signifies also to make him debtor for a sum paid to him. Thus in a bill of exchange, the drawer puts sometimes these words after the sum, *Which you'll place to my account, or, To the account of, &c.*

To purge an ACCOMPT, as the French say, is to cause all the disputed articles to be adjudged by a referee, and the objections to be obviated.

Balance of an ACCOMPT, is the sum in which the debt exceeds the credit, or the credit the debt, when the account is duly examined and settled, and the balance taken. *I owe you 300*l.* for the balance of our account. There is so much due to me for the balance of our account.*

ACCOMPT in Bank, is a fund which merchants, traders, bankers, and other private persons, if they think fit, deposit into the common cash of some bank, to be employed in the payment of bills of exchange, promissory notes, bonds, debts contracted, either in trade or otherwise, as by buying estates in land, &c.

To affirm an ACCOMPT, is to declare and make oath that it is true. The accountable when they deliver in their accounts, in order to their being examined, usually write in the margin of the first page, *presented such a day, and affirmed true.*

To dispute an ACCOUNT, is to make remarks or objections upon the several articles of an account, either for augmenting the receipt, or diminishing the expence therein contained.

To note an ACCOMPT, is to make, in the margin of each article, certain remarks, shewing, either that there is no exception to be made, and that the articles are to pass as set down; or to allege reasons for disputing them, and shewing under what conditions they are to pass. The remarks which the person who audits an account sets on the side of each article by way of approbation, or otherwise, are called the notes (*apostilles*) of an account.

ACCOMPT in company, is a species of account between two merchants, or traders, in consequence of a kind of association or partnership between them.

ACCOMPT is also a relative term, used with regard to partnership, where two or more persons make receipts or disbursements on account of each other. In this sense a man is said to keep a good account, to signify that he is just in his dealings, and does not defraud his partners or masters.

ACCOMPT paper, is a sort of fine large paper, so called at the paper mills in France, and by the stationers and others, who trade in paper, because accounts are commonly wrote upon it. It is like our post-paper in England, on which merchants generally write their commercial letters, and draw out their various accounts.

ACCOMPT of Sales, is an account given by one merchant to another, or by one factor to his principal of the disposal, charges, commission, and net produce of certain merchandizes sent for the proper, or company account of him, who consigned the same to such factor or vender.

When the like account is inland or domestic, the same is transmitted in the current money of that country, wherein the business is transacted. As from a Blackwell-hall factor, to the clothiers in the country, or from the warehouse-men in town, who deal by commission for the country manufacturers, as bay-factors, druggist and duroy-factors, and the like.

EXAMPLE.

The following is the natural form of a Blackwell-hall factor's account of sales to a clothier.

Account of Sales, charges, and net produce of twenty pieces of superfine cloths, received per A. B's C & D waggon of —, consigned to me by C. D. | a 20. of Wiltshire, for his account, marked and numbered as per margin.

Dec. 5th, 1765. Sold to E. F. draper, 6 ps. superfines, per A. B. qt. — yards, at — per yard, to pay in six months - - - - £

Dec. 12, 1765. Sold to G. H. 14 ps. ditto, qt. — yards, at — per yard, to pay in six months - - - - - £

CHARGES.

Paid carriage to London - - - £
Porterage and warehouse room - - - £
Postage of letters - - - - £
Commission, a — per cloth - - - £

Deduct charges £ from the sales.

The net produce is passed to the credit of your account, without my prejudice.

London, January 2, 1766.

E. E. N. O.

It must be observed that, in this account of sales, the manufacturer is supposed to run all the hazard in the sales, and that the factor has only his common commission of so much per cloth for the sale thereof. This is plain from the words, *without my prejudice*; the meaning of which is, that if the buyer should fail, the clothier must stand to the loss.

But some manufacturers, perhaps the generality, rather chuse that their factors should run the hazard of bad debts, their residence in town giving them opportunity of knowing the characters of buyers, and inducing them to be the more cautious whom they trust. In which case, the factor is allowed an extra-commission for standing the middle man; which is reasonable.

If the manufacturer chuses to run the hazard himself, then he cannot expect his money before it becomes due from the buyer. But if it should so happen, that he stands in need of some part of his money before that, as is commonly the case, the factor permits him to draw for such a proportion thereof as they shall agree upon, the manufacturer allowing the factor the common provision for thus advancing the money before it becomes due.

Yet, under these circumstances, the factor has the security of the manufacturer, as well as the buyer, as not being allowed extra-commission to induce him to remain answerable for bad debts.

As the generality of manufacturers cannot afford to be so long out of their money, as the usual time of giving credit requires, it is the more ordinary practice for the factor to stand to bad debts, on consideration of having greater commission allowed him on the sales, and to have provision also for what money he advances before the time of payment.

Mr. Loeke says, "that the multiplying of brokers is prejudicial to the trade of any country; that they eat up too great a share of the gains of trade, and therefore, he observes, it would be convenient to hinder, as much as possible, any one from selling any of our native commodities, but he that makes them: shopkeepers in this being worse than gamesters; for they do not only keep so much of the money of a country constantly in their hands, but also make the public pay them for their keeping of it."

These are severe reflections upon shopkeepers, factors, and brokers, and indeed very unjustly grounded. For, if the clothier was to attempt to act both in the capacity of a factor and a woollen draper, who must attend his manufacture in the country? While his attention was fixed in town upon the sales, might not the commodity dwindle and degenerate in quality; and thus the clothier by over-acting his part in one shape, under-acts it in another? Was this maxim in general to take effect, it might prove the ruin of all our manufactures, by gradually debasing them.

Besides, for a clothier to take this upon him, not only requires three times the capital, but such an expence by town residence, as must prove of little benefit to him in the long run; especially, as the nature of credit is at present circumstanced.

It is true, these middle-men between the manufacturer and consumer may be said to be instrumental to enhance the price of our manufactures among ourselves; and this was Mr. Loeke's motive for bearing so hard upon them. But it is much to be doubted, whether the public could have their manufactures cheaper at home, was the clothier to take upon him to act in a three-fold capacity, he being

being obliged to raise the price of his commodity, in proportion to the extraordinary expence he is at.

Manufacturers, who have thought themselves injured by their factors, which doubtless is sometimes the case, have attempted this, but few have found their account in it. Some have carried their view so far as even to turn merchant-exporters, but commonly to their absolute ruin; for the skill of a manufacturer and that of a merchant are very distinct, the knowledge of a Solomon, in one respect, making him but an idiot in the other.

These observations are not to discourage, but to caution, the ingenious and enterprising manufacturer to be upon his guard, and never to undertake too much, either at home or abroad.

Notwithstanding what has been here said, it is much to be desired that our British manufactures may go as cheap to foreign markets as those of our rival nations, which are not superior in point of quality. Upon this principle Mr. Locke reasoned; and it is upon this principle, that merchants of the most money and skill purchase commodities at first hand of the manufacturer, pay him ready cash, and send their goods abroad, with every advantage.

And these exporters of our manufactures, who are not in circumstances to send them abroad at first hand, are an injury, rather than a benefit to the national trade; by injudiciously glutting the markets abroad, which sinks the price too often below what they can afford to sell at; and yet they are importunate for remittances, and thereby force their factors to sell almost at any rate. Such merchants not only hurt the trade of a kingdom, but are sure to hurt themselves, and all who have connexions in trade with them.

Example of a foreign account of sales.

Account of sales and net produce of 2 bales of druggets, received per the *Hollandia*, Capt. Jan. Roeloff Smith, for the account of M. P. of London.

Nov. 4, 1765. Consigned the above two bales of druggets, qt. 112 pieces, qt. 4875 yards, as per factory (i. e. invoice, which is frequently styled so) which a 3 $\frac{1}{2}$ palms per yard, are palms 18280 net, a fols, 9s. 4d. per palm, to pay in two months - - - - -	8530	13	4
Sold and consigned 2 pieces of white druggets for wrappers - - - - -	140	0	0
	8670	13	4
Charges, viz.			
Freight and primage - - - - -	106	5	0
Porters landing and carrying to warehouse - - - - -	6	0	0

To commission and standing to bad debts at 4 per cent. - - - - -	346	16	4
	514	8	4
Agio	8156	5	0
Agio deducted a 118 $\frac{2}{3}$ per cent.	1283	0	2
Genoa this 30th Nov. 1765, E. E.* Bco.	6873	4	10

* E. E. signifies errors excepted in the account rendered, and Bco. signifies the bank money of Genoa.

Foreign accounts of sales of merchandizes, are, or ought to be, governed in some measure by the invoice, sent therewith from the principal. See INVOICE.

Merchants, being injured to hazard from their first setting out in life, send their property to foreign countries with as much alacrity, on the good faith and honour of their correspondents, as a monied man lends his property at home on land-security.

Credit, therefore, is the great foundation of commerce between nation and nation, as well as between one man and another in the same nation. Whence it follows, that the first principle the trader should tenaciously cultivate, is the support of his personal credit.

It too often falls out, that those who take up their residence at foreign factories, no sooner get a house established there, than they use every art to draw people in to send them large consignments of merchandize by commission. To which end, they at first make remittances to their principals in a reasonable time, and give them an handsome profit upon their goods, in order to induce them to increase their consignments.

When they have thus drawn people in to intrust a large fortune in their hands abroad, it is then that they too often begin to use every dishonourable art, to keep them out of their money.

If you press for remittances, you are given to understand, that nothing can procure them but fresh consignments, which have proved the ruin of many; and, if you draw upon them for your property, your credit may suffer by that means at home.

On these considerations, our most opulent and experienced merchants have established houses of their own, at many of the British factories in foreign countries; wherein they breed up a succession of persons, whom they gradually take into partnership, whereby it is their interest to be punctual and faithful.

Such capital houses seldom take commission from any but the persons who are the principals belonging to those houses: and such are generally capable to supply them with whatever goods they are able to send, and those too with that variety of assortments, which engage the natives to give the preference to these houses, in their general dealings.

Other houses, which take commissions in the general, and never give any in return, too often use not a little craft in making out their foreign accounts of sales, by couching great impositions under many of their articles of charges, which they have never paid.

Nor is this the only practice which ought to be guarded against. Goods perhaps may be sold at three or four months credit, or for ready money, and yet the principal kept out of his property for years, by false and frivolous pretences.

These arts are mentioned, with a view only to guard the young and unexperienced from being too easily ensnared; and we hope they will have the good effect thereby intended.

ACCOMPTANT, one who is not only well skilled in casting up all sorts of accounts, and readily performs all arithmetical operations, but who is versed in the art of book-keeping, by charge and discharge, or by debtor and creditor.

This appellation is applicable to a person, or officer, appointed to keep the accounts of a public company, or office; as the *accountant* of the South-Sea, or India company, or of the Bank, the Custom-house, or Excise, &c.

ACCOMPTANT-GENERAL, a new officer in the court of Chancery, appointed by act of parliament, to receive all money lodged in court, in the place of the masters, &c. He is to convey the money to the Bank, and take the same out by order; and shall only keep the account with the Bank; for the Bank is answerable for all money received by them, and not the *accountant-general*. See stat. 12. Geo. I. c. 32. No fees shall be taken by this officer, or his clerks, on pain of being punished for extortion; but they are to be paid salaries, the *accountant-general* 650l. per annum, the first clerk 250l. and the second clerk 120l. out of interest made of part of the suitors money.

ACCOMTANTSHIP, comprehends not only a skill in figures or arithmetic, but a knowledge in the art of *account-keeping* by debtor and creditor, or by the method of regular charge and discharge, according to the nature of the transaction; which method keeps every distinct account, though ever so numerous, always fit for a balance; and that balance is found by subtracting the sum total on the debit side from the sum total on the credit side; or the sum total of the latter from that of the former.

To be fundamentally grounded in arithmetical operations requires a competent acquaintance with geometry and algebra, because the geometric and algebraic way of reasoning discovers certain rules and theorems, whereby to calculate numerically in the most concise manner: and

and to be properly grounded in the nature of debtor and creditor requires a knowledge in the art of keeping *accounts*, according to the method of double entry, or what is commonly distinguished by the Italian method of book-keeping, or by the name of merchants *accounts*.

Hence it may be observed, that no person can be properly said to be duly skilled in *accountantship*, without being skilled in the art of debtor and creditor, as well as in that of numbers : nor, on the other hand, does any one deserve the name of an accountant, who is only acquainted with book-keeping, and not with figures.

The art of *accountantship* is not only applicable to the regular adjustment of the variety of transactions among traders of every denomination, but also to the private affairs of gentlemen and noblemen. And as it well becomes all persons of the greatest distinction to take due care of their estates ; so nothing, perhaps, can have a happier tendency to that end, than a knowledge in the art of debtor and creditor, as well as that of numbers. For, " merchants accounts, says Mr. Locke, though a science not likely to help a gentleman to get an estate, yet possibly there is not any thing of more use and efficacy to make him preserve the estate he has. 'Tis seldom observed, that he who keeps an account of his income and expence, and thereby has continually under view the course of his domestic affairs, lets them run to ruin. And I doubt not but many a man gets behind before he is aware, or runs farther on, when he is once in, for want of this care, or the skill to do it. I would therefore advise all gentlemen to learn perfectly merchants accounts, and not think it a skill that belongs not to them, because it has received its name, and has been chiefly practised by men of traffic."

Nor is *accountantship* less useful to the gentlemen of the law, than to private gentlemen ; and not only to those who are intended for the bar, but to all solicitors and attorneys ; litigations between traders being so considerable a proportion of the business of our courts of law and equity. Without the perfect knowledge of debtor and creditor in particular, accounts may be so craftily and sophistically stated, as to deceive the most upright judge and jury, as well as the counsel, if they are not capable of unravelling them in the course of their pleadings.

Persons of distinction also, who are concerned in the chief posts of the public revenue, or who act in the senatorial capacity, cannot be too well skilled in *accountantship*. The one will thereby be enabled to acquit himself with credit and reputation in whatever branch of the revenue he shall be employed ; and the other will become perfectly acquainted with the finances and money-affairs of the kingdom. For such is the nature and excellency of the mercantile art of debtor and creditor by double entry, that it is as easily applicable to the accounts of nations as to those of traders, or private gentlemen, millions being as familiarly adjusted thereby, as hundreds of pounds. When once a person is acquainted with the several funds from whence the national revenue arises, as likewise their appropriations to the payment of interest to the national creditors ; when it is duly observed in what manner the deficiencies of some funds are occasionally supplied, and the surpluses of others transferred ; when the general heads of such accounts are understood from the statutes, and the accounts annually laid before the parliament are duly attended to, any gentleman, well-grounded in the art of debtor and creditor, may obtain as complete a knowledge of the money-affairs of the nation, as of his own private concerns : that is, when he is master of the facts relating thereunto, and the distinct heads under which the funds are kept, he will be capable so to state these accounts by way of charge and discharge, or debit and credit, as always to have a satisfactory view before him of the state of the national debts and funds, and of the several variations they shall from time to time undergo.

ACCOMPTING-HOUSE, or COMPTING-HOUSE, is a place set apart by merchants, and other traders, wherein to transact their business, and to keep their accounts and vouchers relating thereunto.

It is the custom of the Dutch merchants in Holland to keep a kind of public *compting-house*, for the reception of a number of gentlemen's sons of fortune, more

particularly of the English, Scots, and Irish, who pay there at the rate of one hundred pounds sterling per ann. and continue with them upon that footing from year to year, as long as they please. It is common to see ten, or a dozen, or more of these young people in a Dutch *compting-house* ; some being weak enough to imagine, that a foreign country is the best place to be bred in, in order to understand the British commerce ; and that there are no merchants who reside in England able to qualify their sons so well as foreigners who reside abroad.

An attempt, however, was lately made to introduce something of the like kind of practice, of keeping of a public *compting-house* in our own country ; and accordingly, a treatise was published for that intent, intitled, " The Merchant's Public Compting-house," or, The " New Mercantile Institution ;" wherein is shewn the necessity of young merchants being bred to trade, with greater advantages than they usually are : with a practicable plan for that purpose.

In this plan are digested, in miniature, the various qualifications, which have been judged necessary to form the accomplished British merchant. And however low an idea some may entertain of the abilities of such a trader, it is presumed that, upon the perusal of this tract, they will be of a different opinion. Persons of candour and impartiality, it is imagined, will therein see, that it is not thrusting a young spark into any *compting-house*, either at home or abroad, that is likely to qualify him to save, much less to improve, an handsome fortune by merchandizing.

ACCORD, is an agreement between two persons to give and accept something in satisfaction of a trespass, or offence done by one to the other. This agreement, when executed may be pleaded in bar to an action for the trespass ; for in all personal injuries, the law gives damages, as an equivalent ; and when the party accepts of an equivalent, there is no injury or cause of complaint ; and therefore present satisfaction is a good plea, but if the wrong doer only promises a future satisfaction, the injury continues till satisfaction is actually made ; and consequently there is a cause of complaint in being ; and if the trespass were now barred by this plea, he can have no remedy for the future satisfaction ; for that supposes the injury to have continuance. 1 New. Abr. 22. 5 E. 4. 7. Plowd. 5. b. 1 Roll's Abr. 129. See Raym. 450. 2 Keb. 332. 2 Jones 158, 168.

ACETABULUM, was both a liquid and dry measure among the Romans, and used particularly in medicine. It contained a *cyathus*, as appears from two verses of Fannius, who speaking of the *cyathus*, says that it contains the weight of ten drachms, and the *oxybaphus*, or *acetabulum*, that of fifteen.

Bis quinque hunc (cyathum) faciunt drachmæ, si appendere tentes ;

Oxybaphus fiet, si quinque addantur ad illas.

Du Pinet, in his *Treatise of Ancient Measures*, placed at the head of his translation of Pliny, pretends that the *acetabulum* of oil weighed two ounces and two scruples ; the *acetabulum* of wine, two ounces, two drachms, one grain, and one third of a grain ; and the *acetabulum* of honey, three ounces, three drachms, one scruple and two *siliquæ*, or eight grains.

ACETUM radictum, (Chemistry) is the most acid part of vinegar, after the phlegm has been drawn off from it.

ACHAIA, now *Livadia*, a province of Turkey in Europe, is bound on the north by Epirus and Thessaly, from which it is divided by mount Oeta, now Banina, and by the Euripus, now the strait of Negropont ; on the east by the Archipelago ; on the south it has the gulph of Engia, or Egina, the isthmus of Corinth, and the gulph of Lepanto ; and, on the west, the Ionian sea, and part of Epirus. *Achaia* is at present divided into three parts : namely, 1. *Livadia*, properly so called. 2. *Stramulipa*, or *Straumzupa*. 3. The dutchy of Athens.

A little way out of Thebes there is a hill, where they dig a kind of stone, of which they make bowls for tobacco-pipes. The stone, when it is first dug out of a deep pit, is of the colour of new cheese, and almost as soft, being

being in lumps commonly as big as a man's two fists. This they bring to the town, and cut and carve very curiously into bowls of pipes; and, as soon as dry, it grows very hard, as white as snow, and shining.

The natural sprightliness of the people of Athens, in all the little matters they undertake and transact, shews itself to be something extraordinary, as in buying, selling, and all their domestic affairs; and it is observed by Mr. Wheeler, that so much of their ancient spirit remains, that few towns in Turkey have preserved themselves so well as this, or enjoy greater privileges, under the tyranny of the Turks. Some other cities, indeed, are by trading, more rich: so that it is a wonder, that Athens, though she has had but an equal share in the ill fortune of all those noble cities of the East under the dominion of the Turks, should be inferior to many of them in trade, when she wants neither good harbours, nor good merchandize for general commerce? The revenue of the city is raised upon the *customs*, *caratchs*, or *poll-money*, *weights* of the town, *avaries*, or *amercements*, *tenths*, and *villanies*; these latter are the cups of acorns, with which they tan their leather. They also who carry merchandize to any fair must pay a certain duty to the Veivode, who receives the whole revenues, and pays to the Kislar-Aga, or chief of the Black Eunuchs, 30,000 crowns a year for his place, which yet brings him in 5000 crowns more, all charges and expences defrayed.

Livadia is large and populous, and is inhabited by many rich Turks, who are more numerous here than the Christians; and there are but few Jews. The trade consists in some woollen stuffs, made here, and in rice, which they sell ready husked, and prepared by water mills, and therewith they furnish all the adjacent country. The inhabitants of Megara, who are all Christians, get their living by tilling the ground, for which they have half the crop; the rest goes to the Turks, as their landlords under the Grand Seignior. They also make pitch, and saw boards and planks, out of the pines and firs, which grow in great abundance on the mountains about there.

The trade of Salona consists in some cotton, but chiefly in tobacco; of which 15 *oka's* are worth but one dollar: and an *oka* weighs about 42 ounces. The little trade they have at Delphos, now Castri, consists of cotton and tobacco; their wine is exceeding good.

The trade of Lepanto consists in leather, oil, tobacco, rice, barley, and wheat: furs are also pretty cheap here. On each side of the city, under a mountain, are fruitful vallies, which stretch out towards the sea. That to the westward is well planted with olives, vineyards, and corn; and that to the eastward is equally well planted, and divided into gardens of oranges, citrons, and lemons. The wine here is the best in Greece. All ships that pass out of the gulph of Petras pay three per cent. custom to the Emir, who pays 6000 crowns rent per annum for his office.

ACHEM, situated in the northernmost part of Sumatra, is the capital of a large kingdom, and almost of all the isle; being the most healthy place, as the others have generally a bad air, from the waters and lowness of the lands. Here it is that foreigners transact the greatest business, and the road is seldom without some English, Dutch, Portuguese, Danish, Chinese, Guzarates, Arabian, Persian, Abyssin, and other ships, from many places of India and China. The goods they bring here are gold and silken stuffs, muslins, painted linnens, cotton, unspun silk, fish, butter, oil, arms and warlike stores, silver, and more especially rice (which the English, Dutch, Danes, and Chinese, bring in large quantities, this part of the isle being intirely destitute of it) white, red, and blue salampouris, percalles, spices, and opium, brought from Bengal.

The Dutch have four or five forts and factories in the dominions of the king of Achem, and those of some other petty princes; among which are *Padang* on the western coast, and *Palimbang* and *Jambi*, on the eastern, a little within land, which in a manner renders them masters of the pepper and gold trade.

ACHIA, a kind of cane that grows in the East-Indies, which is pickled green in the country, with strong vine-

gar, pepper, and some other spices and ingredients. This pickle comes to Europe in a sort of earthen jars, about a foot high, and the same in breadth, growing narrower at the mouth. The pieces of cane are an inch and an half in diameter, and a little above two inches long, almost of the same consistence with pickled cucumbers, being no less crisp, and cutting as well. They are of a pale yellow colour; and, instead of pulps, their inside is a close, fibrous substance, like that of the common canes, when the outside coat is off. The Dutch bring home great quantities of this pickle, which their cold climate makes them think wholesome. They generally eat it towards the end of their meals, judging it very good to quicken the appetite, and strengthen the stomach, by reason of the strong vinegar, lemon, pepper, and other spices, of which the pickle is compounded, and in which the *achia* must always lie, in order to keep it, give it a sharp taste, and make it very hot and fiery.

ACHIAR, a *Malayan* word, much of the same import with the preceding article, as signifying all sorts of fruits and roots, pickled with vinegar and spice. The Dutch import from Batavia all sorts of *achiar*, which the Chinese prepare after the manner of the Malaysians, particularly that of *bambae*, a kind of extraordinary thick cane, which grows in the East-Indies, and is preserved there, whilst still green, as above related, with very strong vinegar and spice. This is called *bambae-achiar*; but the name changes according to the fruit with which the *achiar* is made. The *achiar* is greatly esteemed throughout the East-Indies, and a prodigious trade driven in it. The best comes from Persia, and is preserved in bottles, almost after the same manner as those small cucumbers are in France, which they call *cornichons*. Each sort of fruit is not preserved by itself, but several sorts are often put together into the same bottle.

ACHIOTL, a name given by the Brazilians to a drug used in dyeing, more commonly known by the name of *Rocou*. See *Rocou*.

ACHITH, a sort of vine of the island of Madagascar, which produces a fruit called *voachit*, of the size of a green grape, which ripens in December, January, and February.

ACHLADES, a kind of wild pear, that grows on the mountains of Crete. *Ray*.

ACHOAVAN, or ACHOAVA, a plant so called, that is common in Egypt. It is less high than the *camomile*, but nearly resembles it by its flower, and the *matricaria* by its leaf. *Prosper. Alpin*.

ACHOUROU, a kind of laurel that grows in America, and is called *Indian-wood*. It rises high, is hard, red, and is used in solid works. Its leaves and fruit are aromatic. The decoction of its leaves is taken for diseases of the nerves, and in the dropy. Its fruit which has the figure of a bunch of grapes, and of which the berries are rather oval than round, is full of juice, of a deep violet colour, and covered with a thin skin. It contains green and violet seeds in the shape of a kidney: the flesh of the birds that eat of it, contracts a violet hue, and is bitter to the taste. *Med. Diction*.

ACHTELING, a liquid measure used in Germany: thirty-two achtelings make one heemer. Four schiltens make one achteling.

ACHTENDEELEN, a corn measure used in some parts of Holland. Two hoeds of Gorcum make five achtendeelens; twenty-eight achtendeelens of Asperen make thirty-two of Rotterdam, and only twenty-six of Worcum; twenty-nine achtendeelens of Delft make twelve viertels of Antwerp; and four achtendeelens $\frac{3}{4}$ of Delft, make the hoed of Bruges. This measure is equal to 536 pounds avoirdupois weight.

ACICOCA, an herb that grows in Peru, and is sometimes substituted to the herb *Paraguay*, and believed to contain the same properties. Great quantities of it are yearly carried from Lima, and other parts of Peru, to the city of Avira, from whence it is sent to Potosi, especially when that of Paraguay is very scarce, and consequently dear.

ACKRAM, or ACRON, is a town in Africa on the Guinea coast, not far from Bregu or Berku, and its

principal traffic consists in gold dust, which the inhabitants give in exchange for red cloth, pots, kettles, basons, and other copper kitchen utensils.

ACMELLA, a plant that comes from the island of Ceylon, where it is common. Its character, according to P. Hotton, professor of botany at Leyden, is as follows. The flowers of this plant grow out of the extremity of the stalks, and are composed of a great number of small yellow flowers, radiated, and forming by their union a head borne upon a cup with five leaves. When those flowers fall, they are succeeded by seeds of a dark grey colour, long and smooth, except those at the summit, and furnished with a double beard, which makes them forked; the stalk is square, and covered with leaves growing in pairs, like those of the dead nettle, but longer and more pointed.

Its virtue, or that which is attributed to it, of curing the stone by dissolving it, has made it very famous. In 1690 a Dutch officer assured the Dutch East-India company, that he had cured upwards of a hundred persons of the nephritis, and even of the stone, by the use only of this plant. This testimony was confirmed by that of the governor of Ceylon. In 1699, the hospital-surgeon of Colombo wrote an account of the same circumstances concerning the *acmella* to P. Hotton, distinguishing in his letter three different sorts, particularly by the colour of the leaves, and recommending the sort with black seeds and large leaves.

The leaves are plucked before the flowers appear; and being dried in the sun, are taken pulverized in tea, or some other proper vehicle: or the root, stalks, and branches, are infused in spirit of wine, which is afterwards distilled. The flowers, extract, root, and salts of this plant, are used in the pleurisy, cholics, and fevers.

As a plant of such importance cannot be too well known, we shall add to the foregoing description that of Breyne. This author says, that its root is fibrous and white, its stalk square and about a foot high; that it is divided into several branches; that its leaves are long, pointed, uneven, and with small incisions; and that its flowers shoot out of the extremities of its branches. The same author adds, that a patient may take two or three times a day the tincture of *acmella* prepared with spirit of wine in a glass of French or Rhenish wine, or in some antinephritic decoction, to facilitate the coming forth of the gravel and stone.

We cannot too much invite naturalists to make researches into the properties of this plant. What a blessing it would be for mankind, if those were really discovered which are attributed to it, and who should deserve more to have his name immortalized than him who had devoted himself to this study? Perhaps for this purpose a voyage to Ceylon would be expedient. Animal substances assume singular qualities by the use animals make of certain aliments rather than others; and why should it not be the same with vegetable substances? But if this induction is reasonable, it follows that such a plant gathered on one side of a mountain shall have a virtue which will not be found in the same plant gathered on the other side; that such a plant had formerly a property it has not now, and which perhaps it will never have again; that fruits, vegetables, and animals are in a perpetual fluctuation in regard to their qualities, forms, and elements; that one existing four thousand years ago, or rather our posterity ten thousand years hence, would not know perhaps any of the fruits we now have, by comparing them with the most exact descriptions we make of them; and that consequently we should be very reserved in the judgments we form on the passages, wherein ancient historians and naturalists entertain us with an account of the form, virtues, and other qualities of beings that are in a perpetual motion of alteration. But, it may be said, if salubrious aliments degenerate into poison, what shall animals live upon? Two answers may be made to this objection; the first, that the form and constitution of animals by altering in the same proportion, and by the same insensible degrees, the one will be always suitable to the other; the second, that if a substance happened to degenerate with too much rapidity, animals would relin-

quish the use of it. It is said that the *malum persicum*, or the *peach*, came to us from Persia as a poison, which, however, in our climate, is an excellent fruit, and a very wholesome aliment.

ACOMAS, a tall thick tree of America, with a broad leaf, its fruit like the olive, of a yellow colour, and bitter taste. This tree is used for ship-building, and beams are had from it eighteen inches in diameter, and sixty feet in length.

ACONITUM, the *Monk's-hood*, or *Wolf's-bane*, is a plant with irregular flowers shaped like an helmet or cowl, which are succeeded by several seed-vessels. The species of *monk's-hood* made use of in medicine, is the *anthora*, which is esteemed an antidote to those which are poisonous; so whenever *aconite* is prescribed, this sort is always intended. It is the root only which is used, and at present is never prescribed in England; for though some persons have accounted it a good antidote to expel the poison of the *napellus*, or *wolf's-bane*, as also to be of service against the plague, yet as most of the other species are a deadly poison not only to men, but to brutes also, so few persons care to make use of a plant in medicine upon so slender authority, especially as there is danger of having one of the other species substituted for it. However, we are assured that the peasants of the Alps and the Pyrenees make use of it against the bite of mad dogs and the cholick. It is therefore alexiterial, cordial, stomachic, and good for the wind cholick. It contains a great deal of oil and essential volatile salt. The *napellus* coagulates the blood, the wholesome *aconite* acts by dividing the humours.

ACORI, or BLUE CORAL. The true *acori* is very scarce; some of it, however, is fished up upon the coast of Africa, particularly from *Rio-del-re*, to the river of the *Camarones*. This coral makes part of the merchandise which the Dutch trade for with the *Camarones*. That of the kingdom of Benin is also very much esteemed. It grows in the form of a tree upon a rocky bottom. See CORAL.

ACORUS, the *Sweet Rush*, has a simple cylindrical stalk, which is closely covered with small flowers, so as to form a sort of catkin, or *julus*. These flowers have no empalement, but are composed of six concave obtuse petals. In the center of the flowers is situated a swelling germen, attended by six stamina, which are extended beyond the petals, and are crowned with thick double summits; the germen afterwards turns to a short triangular capsule, having three cells, in which are lodged oval oblong seeds.

We have but one species of this plant, which is the sweet smelling flag, or *calamus*, and this is the true *acorus* of the shops. It grows naturally in standing waters which are shallow, and is found wild in some parts of England, particularly in Norfolk, and also near Uxbridge in Middlesex, and in several parts of the north. In Holland, this plant abounds in most of their ditches and standing waters. The leaves, when broken, emit a strong aromatic scent; but the roots, which are much stronger, have been long used in medicine. This may be transplanted into a garden, where if the ground be moist, it will grow very well; but never produces its spike, unless it grows in the water. It loves an open situation, and will not thrive well under the shade of trees. The roots, which are used in medicine, are hot and dry, opening and attenuating, and thus are esteemed good for removing obstructions of the liver and spleen, to provoke urine and the menses, as also to resist putrefaction, and to be good against any contagion or pestilence. *Miller*.

The *Indian Acorus*, according to *Pomet*, is a reed or knotty root, reddish without, and white within, with long filaments or fibrous strings, of a slight substance, and bearing long, narrow, green leaves, with a fruit about three inches long, of the size and figure of long pepper. The root is usually of the thickness of the little finger, and near half a foot in length. It comes to us from Poland and Tartary, and even from the island of Java, where it is called *diringo*. It is likewise of use in medicine, being one of the ingredients used in the composition of Venice treacle. The perfumers also make much use of it. This sort should be

be chosen new, plump, cleared of its filaments, hard to break, of a sharp taste, attended with a pleasant bitterness, and a sweet aromatic scent.

ACQUIESCENCE, in the French commerce, signifies the consent that a merchant, or other person, gives to carry into execution the determination given either by arbitration, or by a consul, or by any other resolution, in the course of justice. There is no receding from such a judgment or sentence, after an acquiescence, or agreement thereto.

ACQUIT, a discharge, or release, usually denominated in England a receipt. In France and in the Austrian Netherlands, it has various significations in the affairs of their custom-houses.

ACQUIT à caution, is a certificate delivered to any person who enters into an obligation, that a bale of merchandize, transported from any sea-port where the duties of importation have not been levied, shall be subject to the payment of these duties on its arrival at the place of its destination: when this certificate is granted, the bale is stamped with a leaden stamp, bearing the arms of the sovereign or state in whose territories the certificate is demanded; and being accompanied with the certificate, the bale is exempted from visitation on the road; but the certificate must be produced and signed by the proper officer attending at every *comptoir*, or petty custom-house, on the road, of which there are great numbers in France and Flanders, in different districts, and often at very small distances; the least omission of formalities annuls the *acquit à caution*, and subjects the merchandize to confiscation; and this is frequently the case with strangers in Flanders, who omitting to produce and to have these certificates signed on the road, are brought into great difficulties, especially as these *acquits* are sometimes given to passengers for their baggage in passing through foreign countries.

ACQUIT à caution de transit, is a certificate to exempt particular merchandize from the payment of the duties of importation or exportation in passing through the dominions of one sovereign, or state, to another, pursuant to particular contracts, or treaties of commerce, subsisting between them.

ACQUIT de franchise, or of privilege, is a certificate exempting merchandize from the duties on exportation, which have been bought during the time of the privileges of public fairs, and are sent out of the kingdom within the term of holding the said fairs.

ACQUIT de payment, is a certificate in which mention is made of the quantity, weight, marks, &c. of merchandize, with the names of the persons to whom it is forwarded, the amount of the duties levied, of the method of conveyance, of the road to be taken, and of the place of destination; the time also is limited wherein the merchandize ought to arrive at the last *comptoir*, or custom-house, on the road, saving unavoidable delays, and the certificate is to be produced at every office on the road, that the clerk may sign it, and write the word *vu*, or *seen*, with the date; and an omission of this formality subjects the merchandize to a repayment of the duties already levied; or to confiscation, if any fraudulent intention is discovered in delays on the road, or concealment of the *acquit* from the officers appointed to sign it.

ACQUIT, among the French merchants, signifies also a receipt. Paid such a one, by *acquittance*, of such a day; that is, upon receipt, or *acquittance*. When a banker, or any other person, gives to a servant, or porter, a bill of exchange that is due, in order to go and receive the payment of it, he generally indorses it in blank; that is, leaving a void space above his name, that the receipt may be wrote there. But one must always take care, with regard to those blank indorsements, to put the word, *pour acquit*, for receipt, or *acquittance*, under his name, that the void space may not be filled up with an order payable to another, which might be attended with very bad consequences. The French merchants likewise say, to *acquit* bills of exchange, promissory notes, bonds, &c. that is, to pay them.

ACQUITTANCE, a release, or discharge, in writing of a payment, debt, or any other thing we are obliged to pay or perform. Some *acquittances* are made before a notary public, and others only under a person's private

sign manual; they are both equally good, but not equally safe with regard to what may happen afterwards, the latter being sometimes liable to very great inconveniences.

The receipt wrote on the back of a bill of exchange that is paid, is properly a true *acquittance*.

An *acquittance* in law ought to be a deed sealed, though in common practice it is otherwise. 3 Salk. 298. pl. 2. If signed only, and not sealed, it is only an evidence or proof of payment, and no pleadable *acquittance*, because it is no deed, and so as to differ in nothing from proof by witnesses, only that it is not mortal as they are. Wentw. Off. of Executors, 217.

It is observed, that a general receipt, or *acquittance* in full of all demands, will discharge all debts, except such as are on specialty, viz. bonds, bills, and other instruments, sealed and delivered; on which account, those can only be destroyed by some other specialty of equal force, such as a general release, &c. See 2 Cro. 650

In what cases payment may be refused without an acquittance given.

The obligor is not bound to pay without *acquittance* upon a single obligation; nor is he obliged to pay the money before he hath the *acquittance*: but in case of an obligation with condition, it is otherwise; for there one may aver payment. Bro. Obligation, pl. 10. And by stat. 3 and 4 Ann. c. 16. If an action of debt is brought upon a single bill, and the defendant hath paid the money, such payment may be pleaded in bar of the action.

If one is bound in a statute-merchant, or bond, for payment of money, he is not bound to pay it, unless the consue, or obligee, will deliver a release, or *acquittance*. Bro. Fait, pl. 77.

It was said, that in debt upon an obligation, it is a good plea that the defendant has been always ready to pay, &c. if he could have *acquittance*. Br. Tout temps. pl. 39.

In case of a grant of a barc annuity, where the grantee has no remedy by distress, there must be an *acquittance* under seal; otherwise it is not of so high a nature as the grant; per Hale Ch. B. *Hard.* in *Wilson's* case.

When plea of payment without an acquittance may be good.

In debt, the defendant pleaded *acquittance*; the plaintiff said, that the *acquittance* was for another 10l. *absque hoc*, that it was for this 10l. and a good plea. Br. Traverse, pl. 318.

Debt upon indenture of covenants, where the defendant had covenanted to do several things, and the plaintiff likewise to do several other things, *ad quas quidem conventiones perimplendas uterque obligatur alteri* in 100l. and the one broke the covenant, by which the other brought debt; and the defendant pleaded payment of 10l. at D. which was all to which he was bound; judgment *fit assise*; and no plea *per cur.* because he does not shew a deed thereof; whereas the plaintiff declared upon the indenture which is made. And yet *contra*, in pleading of payment of rent reserved upon a lease for years made by indenture; for there he may levy it by distress, and therefore averment may come in ure. Bro. Dette, pl. 173.

One by indenture was bound to pay a sum of money, and in an action of debt thereupon, the defendant pleaded payment; and without *acquittance*, per Montague, this is no good plea; for this indenture is like a simple obligation, payment whereof is no plea without *acquittance*. But it is otherwise, if the obligation be with condition. Dyer 25. b. pl. 160.

ACRE, or **LACRE**. This word is said to be corrupted, and to come from *lack*, which is the true word. It is in use only in the dominions of the Mogul, in regard to his revenues, and signifies the sum of 100,000 roupies; the roupie is of the value of our half-crown. An 100 lacks of roupies make a *couron* in Indostan, or 10,000,000 of roupies; the pound sterling is about eight roupies; according to which, a *lack of roupies* amounts to 12,500 l. sterling, which is more than M. Savary reckons it, by 1,250 l. sterling. This, perhaps, may proceed from the different roupies by which they reckon in that country, and from the variation of their value. The current

current roupies of Surat and Bengal are worth commonly thirty fols of Holland, which is the value of the French crown of three livres.

ACRE, is the universal measure of land in England; and in all bargains and sales of land, the number of acres is mentioned. An acre in England contains four square roods, a rood forty perches or poles; so that it is exactly the same with an acre of woods in Normandy and other parts of France. A Welch acre contains commonly two English ones.

To give a more accurate account of the acre in England, we shall observe, that it is a quantity of land containing in length forty perches, and in breadth four perches; or in proportion to it, be the length or breadth more or less; that is, it is always equal to 160 square perches, whatever figure the land is of, whether square, triangular, or any way irregular. By the custom of some countries the perch differs in quantity, and consequently the acres of land. It is commonly but sixteen feet and a half; but, in Staffordshire, it is twenty-four feet. According to the statute 34 Henry VIII. concerning the sowing of flax, it is declared, that 160 perches make an acre, which is 40 multiplied by 4; and the ordinance of measuring land, 31 Edward I. agrees with this account. This, however, has been altered by custom in several places of this kingdom, by varying perches in the number of feet to 18, 20, 24, and even sometimes 28 feet per perch.

Sir William Petty has calculated, in his *Political Arithmetic*, that England contains 39,038,500 acres; the United Provinces 4,382,000, &c.

ACT of Trade and Navigation. It is hereby enacted, that after the 1st of December, 1660, no goods or commodities whatsoever shall be imported into, or exported out of, any of the English colonies (or that should afterwards become so) in Asia, Africa, or America, but on vessels which do truly belong to the people of England, Ireland, Wales, or Berwick upon Tweed, and navigated with a master, and three fourths of English sailors, under the penalty of forfeiting ship and cargo.

2. No person born out of the allegiance of his majesty, who is not naturalized or made a free denizen, shall, after the 1st of February, 1661, act as a merchant or factor in any of the said places, upon pain of losing all his goods and chattels, and of these clauses the governors are obliged by oath to take cognizance and care.

3. No goods or commodities whatever, of the growth or manufacture of Africa, Asia, and America, shall be imported into England, Ireland, Wales, the islands of Guernsey and Jersey, or town of Berwick upon Tweed, in any other ships but those belonging to the said places, or to the plantations, and navigated in the manner aforesaid, under penalty of forfeiting ship and cargo.

4. No goods or commodities of a foreign growth or manufacture shall be brought into England, Ireland, Wales, the islands of Guernsey and Jersey, or town of Berwick upon Tweed, in ships appertaining to his majesty's subjects, but from the places of their manufactures and growths.

5. That all sorts of ling, stock-fish, pilchards, cod, and herring, or any other kind of dried or salted fish, usually caught by the people of England, Ireland, Wales, or town of Berwick upon Tweed, or any fish-oil, or blubber, whale-fins, or whale-bones, not imported by ships belonging to the said places, shall pay double aliens duties.

6. Henceforth it shall not be lawful for any vessel, in which any stranger (not denizenized or naturalized) is an owner, or that is not navigated by an English master, and three fourths English sailors, to load or carry any sorts of goods or commodities from any port or creek of England, Ireland, Wales, islands of Guernsey or Jersey, or town of Berwick upon Tweed, to another port or creek, of any of them, under penalty of forfeiting ship and cargo.

7. That where any ease, abatement, or privilege is given in the book of rates, to goods or commodities imported or exported in English-built shipping, it shall extend only to such as are navigated with a master and three fourths of the sailors English; and, where it is required that they shall be so, the true intent and meaning is, that they be such during the whole voyage, un-

less in case of sickness, death, or being taken prisoners, to be proved by the oath of the master or other chief officer.

8. No goods or commodities of the growth or manufacture of Muscovy, or any of the dominions of the emperor thereof, or any sorts of masts, timber, or boards, foreign salt, pitch, tar, rosin, hemp or flax, raisins, figs, prunes, olive oils, nor any sort of corn or grain, sugar, pot-ashes, wines, vinegar, or spirits called *aqua vite*, or brandy, shall, after the 1st of April, 1661, be imported into England, Ireland, Wales, or town of Berwick upon Tweed, in any ships but such as belong to the people thereof, and navigated as before mentioned; and that no currants, nor any other commodities, of the growth or manufacture of any part of the Turkish empire, shall, after the 1st of September, 1661, be imported into any of the aforesaid places, in any but an English-built ship, and navigated as aforesaid, except only in such foreign ships as are the built of that country or place, of which the goods are the growth or manufacture, or of such port where the said goods can only be, or most usually are, first shipped for transportation, and whereof the master and three fourths of the mariners, at least, are of the said country or place, under penalty of losing ship and goods.

9. And to prevent the great frauds daily used in colouring and concealing aliens goods, all wines of the growth of France or Germany, which after the 20th of October, 1660, shall be imported into any of the ports or places aforesaid, in any other ships than those belonging to them, and navigated with the mariners thereof, shall be deemed aliens goods, and pay customs accordingly: and all sorts of masts, timber, or boards, as also all foreign salts, pitch, tar, rosin, hemp, flax, raisins, figs, prunes, olive oils, all sorts of corn or grain, sugar, pot-ashes, spirits, commonly called brandy, or *aqua vite*, wines of the growth of Spain, the Canaries, Portugal, Madeira, or Western Islands; and all the goods of the growth or manufacture of Muscovy or Russia, which, after the 1st of April, 1661, shall be imported into any of the aforesaid places, in any other than such shipping, and so navigated; and all currants and Turkey commodities, which, after the 1st of September, 1661, shall be imported into any of the aforesaid places, in any other than English built shipping, and navigated as aforesaid, shall be deemed aliens goods, and pay accordingly.

10. And for the prevention of all frauds in buying of foreign ships, it is enacted, that, from the 1st of April, 1661, no foreign-built ship whatsoever shall be deemed an English, or enjoy the privilege of one, until such time that he or they claiming the said ship, shall make appear by the chief officer of the customs, in the port next to the place of his or their abode, that he or they are not aliens, and shall have taken an oath, (which the officer is hereby authorized to administer) that such ship was by him or them bought for a valuable consideration, expressing the sum, as also the time, place, and persons from whom it was bought, and who are his part-owners, if he has any; all which part-owners shall be liable to take the said oath before the chief officer of the custom-house, of the port next to the place of their abode; and, that no foreigner, directly or indirectly, hath any share or interest therein; and, upon such oath, he or they shall receive a certificate under the hand and seal of the said chief officer, that the said ship may surely be deemed as a ship belonging to that port, and enjoy the privilege of such a ship, and the officer shall keep a register of all such certificates as they shall give, and return a duplicate thereof to the chief officers of the customs of London, for such as shall be granted in England, Wales, and Berwick, and to the chief officers of the customs at Dublin, for such as shall be given in Ireland, together with the names of the persons from whom such ship was bought, and the sum of money which was paid for her, as also the names of all such who are part-owners of her, if any such be.

11. It is likewise enacted, that if any officer of the customs shall, after the said 1st of April, allow the privilege of an English-built ship, to any foreign built one, until such certificate be produced, or oath taken, and until examination be made whether the master and three fourths of the sailors be English, or shall allow the privileges

privileges given by this act to any foreign-built ship, bringing the commodities of the growth of the country where it was built, until examination and proof, whether it be a ship of the built of that country, and that the master and three fourths of the mariners are of that country; or if any governor of any of the plantations shall suffer any foreign-built ship to load or unload any foreign commodities or goods within the precincts of their government, until such certificates shall be produced to them, or those appointed by them, and examination is made whether the master and three fourths of the mariners be English; such officer of the customs, or such governors, shall be displaced for the first offence.

12. It is however, provided, that this act, nor any thing herein contained, extend not, or be meant to restrain and prohibit the importation of any of the commodities of the Straights or Levant seas, laden in English built shipping, and whereof the master and three fourths of the mariners be English, from the usual ports or places for lading of them heretofore, within the said Straights or Levant seas, though the said commodities be not of the very growth of the said places.

13. Provided also, that this act, or any thing therein contained, extend not to restrain the importing of any East-India commodities, laden in English-built shipping, and whereof the master and three fourths of the mariners are English, from the usual places for lading of them in any part of those seas to the southward and eastward of *Cabo bona Speranza*, although the said ports be not the very places of their growth.

14. And it is likewise provided, that it shall be lawful for any of the people of England, Ireland, Wales, islands of Guernsey or Jersey, or Berwick upon Tweed, in their ships, navigated with a master and three fourths English sailors, to bring in from any of the ports of Spain, Portugal, the Azores, Madeira, or Canary Islands, all sorts of goods or commodities of the growth or manufacture of either of them.

15. Provided always, that this act extend not to bullion, nor yet to any goods taken by way of reprisal by any English ship, navigated as before mentioned, and with his majesty's commission.

16. Nothing in this act shall extend to lay alien duties upon any corn of the growth of Scotland, or any salt made there, or any fish caught and cured by the people of that kingdom, and imported directly from thence in Scotch-built vessels, and sailed with a master and three fourths of the mariners of his majesty's subjects; nor to any seal-oil of Russia, imported from thence into England, Ireland, Wales, or Berwick upon Tweed, in shipping thereunto belonging, and navigated as aforesaid.

17. And it is hereby enacted, that any vessel belonging to any subject of the French king, which after the 20th of October, 1660, shall come into any port, creek, &c. of England, Ireland, Wales, or Berwick upon Tweed, and shall there lade or unlade any goods or commodities, or take in, or set on shore, any passengers, shall pay to the collector of his majesty's customs in such port, &c. for every ton of the ship's burthen, to be computed by the officer thereunto appointed, the sum of five shillings, of current-money of England; and that no such ship be suffered to depart out of such port, &c. until the said duty be fully paid; and that this duty shall continue to be collected for such time, as a certain duty, fifty shillings per ton, lately imposed by the French king, or any part thereof, shall continue to be collected upon the shipping of England lading in France, and three months after, and no longer.

18. And it is farther enacted, that after the 1st of April, 1661, no sugars, tobacco, cotton-wool, indigo, ginger, fustic, or other dying wood, of the growth or manufactures of any English plantations in America, Asia, or Africa, shall be carried from any of the said English plantations, to any place whatsoever, other than to such other English plantations as do belong to his majesty, or to the kingdom of England, Ireland, Wales, or Berwick upon Tweed, there to be laid on shore, under the penalty of forfeiting ship and goods.

19. And for every ship, which after the 25th of December, 1660, shall set out from England, Ireland, Wales, or Berwick upon Tweed, for any English plan-

tation in America, Asia, or Africa, sufficient bond shall be given with one surety to the chief officers of the custom-house of such port from whence the said ship shall sail, to the value of one thousand pounds, if the said ship be of less burthen than one hundred tons, and of two thousand pounds, if the said ship be of greater burthen; that in case the said ship shall load any of the said commodities at any of the said English plantations, that the said commodities shall be brought by the said ship to some port of England, Ireland, Wales, or to the port of Berwick upon Tweed, and shall there put on shore the same, the danger of the seas only excepted: and for all ships coming from any other port or place to any of the aforesaid plantations, who by this act are permitted to trade there, that the governor of such English plantations shall, before the said ship be permitted to load any of the said commodities, take bond in the manner, and to the value aforesaid, for each respective ship, that such ship shall carry all the aforesaid goods that shall be laden on board to some other of his majesty's English plantations, or to England, Ireland, Wales, or Berwick upon Tweed: and that every ship which shall load any of the aforesaid goods, until such bond be given to the governor, or certificate produced from the officers of any custom-house in England, &c. that such bonds have been there duly given, shall be forfeited; and the said governors shall twice in every year, after the 1st of January, 1660, return true copies of all such bonds to the chief officer of the customs in London.

ACTION, a right which any person has to sue for any demand or pretension at law. It is also said of *actions* entered against a person, and of the proceedings carried on for asserting and proving one's right.

The design of entering into society being the protection of our persons and security of our property, men in civil society have a right, and indeed are obliged to apply to the public for redress, when they are injured; for were they allowed to be their own carvers, or to make reprisals, which they might do in the state of nature; such permission would introduce all that inconvenience which the state of nature endured; and which government was at first invented to prevent. Hence therefore they are obliged to submit to the public the measure of their damages, and to have recourse to the law and the courts of justice, which are appointed to give them ease in their affairs; and this application is what we call bringing an *action*. 1 *New Abr.* 26.

ACTION, on the case. It has been observed, that for every injury done a man in his person, reputation, or property, the party hath a remedy; but this remedy he must take according to the methods laid down, and rules prescribed by the law; for which purpose there are writs framed, and settled actions to which he must apply; as debt upon a contract, trespass on a manifest and open invasion of property, &c. but where the law has made no provision, or rather, where no general action could well be framed before-hand, the ways of injuring, and methods of deceiving being so various, every person is allowed to bring a special action on his own case. 1 *New Abr.* 44. *Co. Lit.* 56. a. 6 *Mod.* 53, 54. Nor is it any objection that such action was never brought before; as where the lessor coming to view the lands, to see if any waste was committed, being hindered by a stranger from entering the premises, brought an *action on the case* against him; and it was held to lie, though such action had never been brought before. *Cro. Jac.* 478. 1 *Roll. Abr.* 108, 109. 2 *Roll. Rep.* 311. See 6 *Mod.* 53. and *Lit. sect.* 108. Where, *per Littleton*, no action having been brought on the statute of Morton, it is to be presumed that no action will lie: and *Co. Lit.* 81. b. *per Lord Coke*, non-usage is a good interpreter of a law. But *per Holt*, Ch. Just. wherever an act of parliament gives a right, the common law gives a remedy; so where the common law gives a right, or makes a thing an injury, the same law gives a remedy or action. 1 *Salk.* 20, 21. 6 *Mod.* 54.

ACTION on the case, against carriers, and upon the custom of England. If a man delivers goods to a common carrier to carry to a certain place; if he loses them, an *action on the case* lies against him; for by the common custom of the realm, he ought to carry them safely. If a man delivers goods to a common hoyman, who is a common

common carrier of goods, to carry them to a certain place, and gives him according to the custom for the carriage of them, and after by default of good keeping of them they are lost, an action upon the case lies against him; for, by the common custom of the realm, he ought to keep and carry them safely. *Hob. 25.*

And if a man delivers goods to such common hoyman to carry to a place, and after delivers them (being of good value) to another to keep safely in the boat, and does not discharge the hoyman, and after they are lost through negligence, an action upon the case lies against him. *Hob. 25. Cro. Jac. 330. pl. 9. S. C.* says the defendant confessed the receipt, and said he was a common barge-man; but that he fearing to carry it, delivered it to J. D. to carry it, and that he gave notice thereof to the plaintiff, and he agreed thereto, and discharged him of the carriage. The plaintiff traversed the discharging him, and adjudged for the plaintiff; for the delivery by his assent is not material; but the only matter traversable is the discharge, which is issuable, and found for the plaintiff; and the judgment was affirmed on error brought.

In account for wares delivered *ad merchandizandum*; the defendant pleaded, that he was robbed of those goods, and of many more of his own goods; it was held, that this might be a good plea for a factor or for a servant, but not for a common carrier, because he receives a premium for the charge. *Moor 462. Woodcliffe's case.*

A carrier agreed to carry goods of the plaintiff from H. to London, paying him for the carriage, and in action on the case brought against the carrier, the plaintiff declared against him for not carrying goods, and that *paratus fuit solvere*; it was objected, that the declaration was ill, for he should have set forth, that he had paid for the carriage, or had tendered the money; but the plaintiff had judgment. *2 Roll. Rep. 466.*

Case, &c. by the plaintiff, who was a merchant, setting forth, that by the common law every lighterman ought to govern his lighter, that the merchants goods come to no damage; that the plaintiff was a merchant, and the defendant a lighterman, and that he had carried the plaintiff's goods from such a place to such a place for hire, viz. for so much money, and that he had so negligently governed his lighter that the goods were damaged; after a verdict for the plaintiff, it was objected, that the action would not lie, because the plaintiff had not averred, that the defendant was a common lighterman; besides, he did not set forth how his goods were spoiled; but both these exceptions were over-ruled; and though there was no promise, yet since this action arises *ex malefacto*, there is no occasion to alledge a promise, for the delivery of goods to a common carrier implies a contract. *Palm. 523.*

Case, &c. against a common carrier, for so negligently carrying the plaintiff's goods that they were lost, and he declared likewise in trover; adjudged, that the declaration was good, because the plea of not guilty goes to both; but this was after a verdict. *Sid. 244.*

Case, &c. in which the plaintiff declared, that he delivered to the defendant (being a water-carrier) goods in York to carry them from Hull to London, and that the goods were lost; after a verdict for the plaintiff, it was objected in an arrest of judgment, that there was no positive agreement set forth between the plaintiff and defendant for any certain sum for the carriage; besides, the agreement was to carry the goods from Hull to London, so that the defendant did not undertake to carry them from York to London; but adjudged, that he shall be charged upon the general receipt at York, and that it is not requisite to set forth any agreement of the premium. *Sid. 36.*

Assumpsit by a carrier, upon a promise to pay so much for carrying goods from York to London; if the plaintiff in his declaration doth aver performance, and doth not shew in what parish and ward he brought the goods, it is ill upon a demurrer. *Sid. 178.*

Case, &c. upon the custom of England against a master of a ship, for negligently keeping the plaintiff's goods; in which a special verdict found, that the ship lay in the river Thames, and that the goods were delivered on board, &c. that in the night-time several

persons pretending to press seamen by force, seized those men which were in the ship, and the goods were lost; that the master was to have wages of the owner of the ship, and the mariners wages of the master; the question was, whether the master was chargeable for the loss of these goods; it was argued that he was not, because the master is but a servant to the owners, and he receives his wages from them; but adjudged he is rather an officer than a servant, for he may pawn the ship if he see occasion, he may sell *bona peritura*, &c. and though he receives his wages from the owners, yet in effect he is paid by the merchant; for it is he who pays the owners, and there is no difference between this case and that of a hoyman or common carrier. *1 Vent. 190, 238.*

Assumpsit for money due by custom for scavage; upon non assumpsit the jury found the duty to be due, but no promise expressly to pay it; adjudged that an assumpsit will lie for this money due by custom, without an express promise. *2 Lev. 174.*

Adjudged, that a common carrier is liable in respect of the reward he takes, and not because the hundred is answerable over to him; for he was chargeable at common law before the statute of Winton, which makes the hundred liable; and the reason why he is chargeable, is, because he might be robbed by consent and combination, of which it might be difficult to make any proof. *1 Salk. 143.*

In an action on the case upon the custom of the realm against the defendant, who was master of a stage-coach, the plaintiff sets forth, that he took a place in the coach for such a town, and that in the journey the defendant, by negligence, lost the plaintiff's trunk; upon not guilty pleaded, the evidence was, that the plaintiff gave the trunk to the man who drove the coach, who promised to take care of it, but lost it; and the question was, whether the master was chargeable, and adjudged that he was not, unless the master takes a price for the carriage of the goods as well as for the carriage of the person, and then he is within the custom as a carrier is: that a master is not chargeable for the acts of his servant, but when they are done in execution of the authority given by the master, and then the act of the servant is the act of the master. *1 Salk. 182.*

ACTION on the case for deceits, frauds, and unexpressed and implied warranties. A merchant stranger shipped 4500 quintals of wood to be brought to England, and a great tempest arising, the master cast part of it into the sea, and afterwards coming into port, told the custom officer, that he believed 2000 quintals remained, when upon further examination there were above 1000 more; and an information being exhibited for the forfeiture of those 1000 quintals, for which no custom was paid, it was adjudged that the uncertain account made with the officer for 2000 quintals only before the landing, was good, because it appeared there was no manner of deceit. *Plowd. 1.*

The defendant sold sheep, and warranted that they were found, and should be found for a year next coming; adjudged, that the warranty is not impossible to be performed, no more than to warrant, that such a ship shall return safe to London; so the action will lie. *Owen. 60.*

Case, &c. in which the plaintiff declared, that in consideration of 20 l. paid by him to the defendant, he promised to deliver to him 400 pounds of wax on such a day, and that at the day he did deliver 373 pounds of bad wax, which he warranted to be good and merchantable; by which he was damaged, &c. the defendant pleaded an agreement between them, as well for the twenty-seven pounds not delivered, as for the badness of that which was delivered; upon which plea the plaintiff demurred, because the defendant had not answered the deceit; adjudged, that it was not material to answer it, because the warranty; that the wax was good was after the contract made. *Dyer 75.*

Assumpsit, &c. for that there being a discourse between the plaintiff and B. G. about certain hogs of the plaintiff's to be put to mast; the defendant promised in consideration the plaintiff would give B. G. 3 s. for every hog put to mast, that they should be well fatted and re-

delivered; adjudged, that the action lay, though the defendant had no manner of benefit by the promise, because it was grounded upon a deceit. *Cro. Eliz.* 200.

The plaintiff being a merchant in London went beyond sea to trade, and appointed the defendant to receive all goods consigned to him in his absence, and to pay the customs, and to dispose them to the plaintiff's use; afterwards twenty pieces of velvet were consigned to the plaintiff, and imported into London, of which the defendant having notice, caused the goods to be landed without paying the custom, or agreeing with the officer, by reason whereof they were forfeited and seized; adjudged, that for this matter a special action on the case did lie. *2 Cro.* 265.

The defendant having counterfeit jewels, and knowing them to be such, sent his servant with them to the plaintiff, being a merchant in Barbary, to sell them there; and the plaintiff sold them to the king of Morocco for 800*l.* and the servant received the money, and returned home to London; afterwards the cheat being discovered, the plaintiff was imprisoned in Barbary, and compelled to make restitution to the king; adjudged, that the action did lie against the master. *Poph.* 143.

A clothier made good cloth, to which he set his mark, and got a great trade; another set the same mark upon bad cloth, for which the action was brought, and adjudged that it did lie. *Poph.* 143. *2 Cro.* 468.

Case, &c. for a deceit, in which the plaintiff declared, that he bought silk of the defendant for such silk, &c. whereas it was of another kind, and that the defendant knowing the deceit, sold it to him; upon not guilty pleaded, it appeared that there was no actual deceit in the defendant, who was the merchant, but that it was in his factor beyond sea; but adjudged, that his deceit shall charge the merchant, because it is more reasonable, that he who puts a trust in a deceiver should lose than a stranger. *Salk.* 289.

So where the plaintiff declared that the defendant being possessed of a certain lottery-ticket, sold it to him, affirming it to be his own, whereas in truth it was not his but another's; defendant pleaded he bought it *bona fide*, and sold it: on demurrer, *Holt*, Ch. J. held, where one having the possession of any personal chattle, sells it, the bare affirming it to be his amounts to a warranty, and an action lies on the affirmation; for his having possession is a colour of title, and perhaps no other title can be made out; *aliter* where the seller is out of possession; for there may be room to question the seller's title, and *caveat emptor* in such case to have either an express warranty, or a good title; so it is in case of lands, whether the seller be in or out of possession; for the seller cannot have them without a title, and the buyer is at his peril to see it. *1 Salk.* 210. See *Style* 343, 346. *Cro. Jac.* 197.

If A. being a goldsmith, and having skill in jewels and precious stones, hath a stone which he affirms to be a bezoar stone, and sells it to B. for 100*l.* *ubi re vera* it was no bezoar stone, no action lies against A. for every one in selling his wares will affirm that his wares are good, or that the horse which he sells is sound; and yet if he does not warrant them so, if false, no action lies. *Cro. Jac.* 4.

But if a man sells a tun of wine, and warrants it to be sound and not corrupted, if it be corrupted, an action upon the case lies. *1 New Abr.* 52. *11 H. vi.* 18. *F. N. B.* 94. *S. P.*

So if a man sells a horse, and warrants him to be sound of wind and limbs, if he be not, an action upon the case lies. *11 H. vi.* 18. *1. Roll. Abr.* 96. *S. C.*

ACTION on the case upon *Assumpsit*. An *assumpsit* is an action the law gives a party injured, for the breach or non-performance of a contract legally entered into; it is founded on a contract either express or implied by law, and gives the party damages in proportion to the loss he has sustained by violation of the contract. *4 Co.* 92. *Moor.* 667.

But there it must be observed that the law distinguishes between a general *indebitatus assumpsit*, and a special *assumpsit*; for though they come under the denomination of action on the case, and the party is to be recompensed

in damages alike in both, yet the first seems to be of a superior nature, and will lie in no case but where debt will lie; but for a particular undertaking, or collateral promise to discharge the debt or duty of another, a special *assumpsit* must be brought. *1 New Abr.* 163.

If A and B having dealings with each other, make up their accounts, and B is found in arrear, and promises to pay the balance, an *assumpsit* lies against him, and A need not bring a writ of account. *Cro. Jac.* 69. *Yel.* 70.

So if A gives money, or delivers goods to B to merchandize therewith, and B promises to render an account, *assumpsit* lies on this express promise as well as account. *1 Salk.* 9.

So if a tenant being in arrear for rent, settles an account of the arrears with his landlord, and promises to pay him the sum in which he is found in arrear, an *assumpsit* lies on this promise. *Roll. Abr.*

But if the obligor in a bond, without any new consideration, as forbearance, &c. promises to pay the money, an *assumpsit* will not lie, but the obligee must still pursue his remedy by action of debt. *1 Roll. Abr.* 8.

An *indebitatus assumpsit* lies for money by custom due for seavage; adjudged upon a special verdict, by which it was found, that the sum demanded was due by custom, but that there was no express promise to pay it. *2 Lev.* 174.

Neither debt nor general *indebitatus assumpsit* will lie against the acceptor of a bill of exchange; for his engaging is but a collateral promise on which a special action on the case lies, founded on the custom of merchants; but debt, or a general *indebitatus*, may be brought against the drawer, as for money received for the use of the party. *Hard.* 485, 486.

Also if A delivers money to B to pay over to C, and gives C a bill of exchange drawn upon B, and B accepts it, C may have an *indebitatus assumpsit* against B, as having received money to his use, but must not declare only on the bill of exchange accepted. *1 Vent.* 153.

An *indebitatus assumpsit* lies for 20*l.* forfeited by the ordinances and constitutions of a company, for not serving in the office of steward of the company, according to a bye-law by them made. *2 Lev.* 252.

If one receives my rent under pretence of title, I may have an *indebitatus assumpsit* against him. *2 Mod.* 263.

If A takes an apprentice and receives 30*l.* with him, for which he is to teach him his trade, and make him free of the city of London, and being no freeman himself, the boy is likewise bound to a freeman; admitting that by the custom of London, the last binding will not make him free without actual service, yet an *indebitatus assumpsit* will not lie, nor has the party any remedy, unless for the cheat, or on special action on the case for not making him a freeman. *Comb.* 431.

If three are bound in an usurious obligation, and one of them pays part of the money, and afterwards the obligee brings debt against one of the obligors, who avoids the bond for usury, yet the obligee who paid the money cannot maintain an *indebitatus assumpsit*, for he is *particeps criminis*, and having parted with his money freely, he comes within the rule *volenti non fit injuria*. *1 Salk.* 22.

But if A pays money to B upon a mistake, as thinking there was so much due on account, &c. he may maintain an *assumpsit* for it. *1 Salk.* 21.

So if a man pays money upon a policy of assurance, supposing a loss, when in truth there was not any, he may bring an *indebitatus assumpsit* for so much money received to his use. *Skin.* 412.

So if A gives money to B to pay C upon C's delivering up writings, &c. and C will not do it, an *indebitatus* will lie for A against B for so much money received to his use. *6 Mod.* 161.

Where a man comes to buy goods, and they agree upon a price and a day for the payment, and the buyer takes them away, an *assumpsit* for the money is a proper action, for *trover* will not lie for the goods, because the property was changed by a lawful bargain, and by that bargain, the buyer was to convert the goods before the money was due; but if a man comes to buy goods, and they agree upon a price for present money, and the buyer takes

takes the goods away without payment, *trover* lies, because the property is altered, and therefore the taking away the goods without payment of the money, is an injurious taking, for which the action lies; but if a man sells goods on payment of money on a day to come, and the money be paid, and the goods not delivered, *trover* lies, because the property is in the buyer. 1 *New Abr.* 167.

All promises and contracts are to receive a favourable interpretation; and such construction is to be made, where any obscurity appears, as will best answer the intent of the parties; otherwise a person, by obscure wording of his contract, might find means to evade and elude the force of it. Hence it is a general rule, that all promises shall be taken most strongly against the promiser, and are not to be rejected, if they can by any means be reduced to a certainty.

So if A lie indebted to B for certain things to him sold, and C comes to B, and promises him that if A shall not pay him the money, that then he himself will pay it; an action upon the case lies for B against C upon this promise, if A does not pay the money in a convenient time. 1 *Roll. Abr.* 15.

If A is indebted to B in 10 l. and upon this C promises in consideration that he will forbear A till such a day, if A does not pay him the said day, he himself will pay him the said day; this is a good promise, upon which B may have an action against C; for though A had the whole day to pay it, and so it was impossible for C to pay it the same day, if he did not pay it, yet the substance of the promise is to pay, and the time limited being impossible, is void, and then it might be paid on request. 1 *Roll. Abr.* 13.

ACTION on the case, for slander or defamation against tradesmen. *William Kemp will be within these two days a bankrupt*; actionable. *Dyer* 72.

Of a gentleman trading in lead in Derbyshire, viz. *He is a bankrupt, and is not able to pay his debts, but will run his country*; actionable. *Hutt.* 46.

Of a merchant, being an alien born, viz. *Firrot is a bankrupt*; actionable; 1 *Bullst.* 134.

Of a dyer, *Thou art a bankrupt knave*; actionable, though two substantives; but if it had been *bankruptly knave*, otherwise. 2 *Cro.* 345.

Of a merchant, *He is a bankrupt slave*; actionable. 2 *Cro.* 578.

Of a shoemaker. *He is a bankrupt rogue*; actionable; for though it was insisted, that the word *bankrupt* is but an adjective to rogue, and so it is extenuated, yet it was adjudged, that the addition of the word *rogue* to *bankrupt* aggravates it; and that a shoemaker is within the statute of bankrupts, for he gets his living by buying and selling. *Hutt.* 52.

Of a midwife, viz. *Many have perished for her want of skill*; actionable. *Gro. Car.* 153.

Of a merchant, viz. *He is not worth a groat, he is 100 l. worse than naught*; actionable. *Cro. Car.* 193.

Of a merchant, viz. *Thou art a rogue and a beggarly fellow, and I will prove thee a bankrupt before next term*; and at another time he said to one Harris, *Trust him not, for he will be thy undoing*; actionable. *Cro. Car.* 171.

Of a merchant, viz. *He is a cheating knave, and hath cheated his father, by returning 20 l. for wares*; actionable. *Cro. Car.* 413.

Case, &c. *Thou camest a broken merchant from Ham-burgh into England*; actionable; for it is the same as to say, he is a bankrupt. *W. Jones.* 321.

There was to be a trial at Guildhall, between one Buxton and another, plaintiffs, and Johnson, defendant, who was likewise a merchant, and the day before the trial, one Bolton discoursing with the now defendant Lemman, asked him, will you be at the trial tomorrow between Buxton and Johnson, who replied, *Johnson is broke, I warrant you he dares not be there*; adjudged actionable. *Palm.* 63.

Case for these words spoken of a malster, wherein the plaintiff laid a colloquium of his trade; the words were, *Have a care of him, and do not deal with him, he is a cheat and will cheat you, he has cheated all the farmers at Epping, and dares not shew his face there, and now he is to come to cheat at Hatfield*; upon not guilty pleaded, a special ver-

dict found all these words, but there was no colloquium of his trade; adjudged, that the words supply the colloquium, so they appear to be spoke of his trade. 2 *Lev.* 62.

An action was brought by a draper for these words, *You are a cheating fellow, and keep a false book, and I will prove it*: upon not guilty pleaded, the plaintiff had a verdict, but the judgment was arrested, because plaintiff did not alledge, that there was any colloquium of his trade, or of his buying and selling at the time when the words were spoken; for to say a man is a cheating fellow, it doth not follow that he is so in his trade, for he may cheat at gaming, and not in his dealing, and the words being general, may as well be applied to that as to his trade; and the keeping a false book doth not imply, that the defendant kept a false debt-book, for he might have a book which is false printed, as well as a false debt-book. 2 *Saund.* 307.

Case, &c. for these words, viz. *Orton says, I am a perjured knave, but he is a perjured knave as well as I, for he and Field swore one for another*: after a verdict for the plaintiff; it was moved, that this was no positive charge that the plaintiff was perjured, but only by relation, viz. that he was perjured as well as the defendant; but adjudged for the plaintiff. *Raym.* 51.

Case, &c. for words of a broker, speaking of his profession, *He is a cheating knave, he hath cheated me with brass money*; adjudged, that to call a tradesman a cheat generally, an action will not lie; but if you speak of his trade, it will lie. *Raym.* 62.

Case, &c. by a merchant for these words, (there being a communication of him,) *I believe all is not well with Daniel Vivian; there are many merchants that have lately failed, and I expect no otherwise of Daniel Vivian*: after a verdict for the plaintiff, the words were held actionable. *Raym.* 207.

Case, &c. in which the plaintiff declared, that he is a lime-burner, &c. and gets his living by buying and selling lime, and that the defendant spoke of him (the plaintiff) in arte sua, viz. *John Terry is a runaway, and a cheating rogue*, upon not guilty pleaded, the plaintiff had a verdict; it was moved in arrest of judgment, that the defendant did not speak those words as relating to the trade of lime-burning, but generally de arte sua; and he may have another trade; but adjudged, that though in ancient times, it was the constant course to lay a colloquium in declarations for words, and it was a doubt, whether it was good without it till the case of Smith a Ward, 2 *Cro.* 673, yet in that case it was resolved, that to alledge the words to be spoken de quereute supplied the colloquium, and in the principal case the words are alledged to be spoken de arte sua, which is applicable to his profession. *Raym.* 86.

Case, in which the plaintiff declared, that he is a mercer, and that the defendant spoke these words, *Thou art a cheating knave, and a rogue*: after a verdict for the plaintiff, it was moved in arrest of judgment, that here was no colloquium laid of his trade; the judgment was staid. *Raym.* 166.

Case brought by a merchant for these words, *Austine Drake is broke, he is a beggarly fellow, and not worth a groat, and not able to pay his debts*: upon not guilty pleaded, the plaintiff had a verdict; and it was moved in arrest of judgment, that these words are not actionable, for he may be an honest man and not worth a groat, and to be a beggarly fellow is no crime, for it imports only that he was a poor man, and that is not a fault, but a misfortune; but the plaintiff had judgment, because to say, *He is not able to pay his debts*, is actionable. *Raym.* 184.

Case, &c. in which the plaintiff declared, that he is keeper of a livery-stable, and of Bell-Savage Inn; and that T. P. coming with a waggon into the yard, and enquiring of the defendant, which was Bell-Savage Inn, the defendant replied, *This is Bell-Savage Inn, deal not with Southam (the plaintiff) for he is broke, and there is neither entertainment for man or horse*; after a verdict for the plaintiff and great damages, the judgment was affirmed. *Raym.* 231.

Case, &c. in which the plaintiff declared, that by buying and selling wares, *uberrimam sibi & familie acquirit vivendi sustentationem*, (without mentioning any trade) and that the defendant said of him (the plaintiff)

Thou art a pitiful, beggarly, broken fellow; after a verdict for the plaintiff, it was objected, that the plaintiff did not allege, that he was of any trade; but this objection was over-ruled, and the plaintiff had judgment. *T. Jones 140.*

Cafe, &c. in which the plaintiff declared, that he is a renter of lands, and that he had gained great profit by buying and selling *wheat, barley, &c.* and that the defendant said these words of him, (*viz. he hath cheated in corn*;) after a verdict for the plaintiff, it was held *per curiam*, that the words are not actionable, and that the words of inducement were only a description of a farmer, and if they should be actionable, every farmer would be entitled to the like action. *T. Jones 156.*

Cafe, &c. in which the plaintiff declared that, there being a communication of his trade, the defendant said, *He was a cheating knave, and kept a false debt-book, with which he cheated the country*; after a verdict for the plaintiff, it was moved in arrest of judgment, that to say of a tradesman, *He is a cheating knave*, though there was a colloquium of his trade, is not actionable; because it may be intended he sold his goods too dear, and so cheated the buyer in the price; and to say he kept a *false book* is not actionable, because he may keep such a book, not knowing it to be false; but adjudged, that the words taken all together are actionable, for tradesmens books are often given in evidence, and therefore they ought not to be false. *1 Vent. 263.*

Cafe for these words, spoken of a merchant who made a bon-fire at his door when king James the Second came to the crown, *viz. He is a rogue, a papist dog, and a pitiful fellow, and never a rogue in town had a bon-fire before his door but he*; after a verdict for the plaintiff, and 500*l.* damages, a writ of error was brought; but *per curiam*, the words are actionable. *3 Mod. 103.*

Cafe, &c. for these words spoken of a farmer, *He owes more money than he is worth, he is broke and run away*; after a verdict for the plaintiff, *per curiam*, the words are actionable.

His son, Brooks, hath deceived me in a reckoning for wares; and his debt-book which he keepeth for sale of his wares in his shop, is a false debt-book, and I will make him ashamed of his calling; not actionable. *Brownl. 4.*

The plaintiff declared, that for many years past *suit mercator*, &c. and the defendant said, *Thou art a beggarly knave, and a bankrupt*; it was doubted whether actionable, because he did not allege, that he was a merchant at the time the words were spoken. *Cro. Eliz. 794.*

Cafe by an inn-keeper against the defendant, for calling him (the plaintiff) *caterpillar, for he liveth by robbing his guests*; adjudged not actionable. *Moor 179.*

Cafe, &c. for these words spoken of an inn-keeper, *Your master, Thomas Clerke, did harbour and lodge cut-purses and rogues, and did receive stolen goods, and there are yet some in his house*; and declared, that by reason of speaking those words he lost his guests; adjudged not actionable; for an inn-keeper's house being common to all his guests, he may lodge cut-purses, and receive stolen goods, and not know them to be such. *2 Roll. Rep. 136.*

Cafe, &c. against husband and wife, in which the plaintiff declared, that he was a freeman of London, and a tradesman, and that he got his living by buying and selling *crewel*, and that the wife, &c. said, *He (the plaintiff) is a cheater; and hath cozened and cheated my husband of 500*l.* after a verdict for the plaintiff, and 40*l.* damages, the judgment was arrested, for that the words were not actionable, because it did not appear that the cozening and cheating was in any thing concerning his trade. W. Jones 366.*

Cafe, &c. in which the plaintiff declared, that he was a common brewer, and that the defendant, upon a discourse which he had with another concerning the plaintiff, said these words of him, *I will give my mare a peck of malt, and give her water after it, and she shall piss as good beer as Thomas Fen breweth (inueno the plaintiff) by reason whereof he lost several customers, but mentioned none in particular; and that being moved in arrest of judgment, after verdict for the plaintiff, the judgment was reversed; for the words are not actionable, without alledging a particular loss. W. Jones 444.*

Cafe for these words spoken of a distiller, in which the plaintiff declared, that the defendant discoursing with one *Isher*, asked him of whom he bought *aqua vita*, who replied, of Mr. Godfrey (the plaintiff); thereupon the defendant said, *He is a varlet, he hath suppressed his brother's will, to cozen and deceive men of their legacies, we will make him cry peccavi on his knees, he maketh shew of religion, but is an hypocrite*; adjudged not actionable, because the words do not relate to his trade. *Palm. 21.*

The plaintiff being a mercer, declared against the defendant for these words, (*viz.*) *Thou dost owe more than thou art worth, and art not able to pay thy debts*; adjudged not actionable, because the words do not imply any fraud or deceit, so they will not amount to a bankruptcy within the statutes, for a man may owe more than he is worth, and yet be an honest man, and have credit by friends to support him in trade. *Style 213.*

Cafe, &c. for these words spoken of a merchant, *Thou art a cheating rogue, and a runagate rogue*; after a verdict for the plaintiff, adjudged not actionable; for to say generally, that a man is a cheater, is not actionable without a colloquium laid of his trade or profession, which was not done in this case. *Hard. 8.*

Cafe, &c. for these words spoken of a watchmaker, (*viz.*) *He is a bungler, and knows not how to make a good piece of work*; after a verdict for the plaintiff, wherein the jury said that he was a watchmaker, it was objected, that there was no colloquium laid out of his trade; it is true, if the words had been, he could not make a good watch, it would have been known what he meant, but here the words are indifferent, and may have no relation to his trade; the judgment was stayed. *1 Mod. 19.*

Cafe, &c. in which the plaintiff declared, that he was a merchant, and that by his good name he had the good will of his neighbours, and also that by buying and selling he got *diversa lucra*, &c. and that the defendant called him a bankrupt; after a verdict for the plaintiff, it was moved in arrest of judgment, that the declaration was ill, because it did not appear that he gained his living by buying and selling; the judgment was set aside. *Sid. 299.*

Cafe, &c. in which the plaintiff declared, that he for seven years last past, had lawfully used the art of buying and selling, and had gained great profit thereby, for the support of himself and family, and that the defendant *falso & malitiose* said of him (the plaintiff), *He is a runagate, and worse than a rogue, and if he had his deserts he had been hanged*; whereby he lost his custom, but he did not lay any special damage; after a verdict for the plaintiff, the judgment was stayed, because *runagate* is not of the same signification as *bankrupt*; and here the plaintiff did not set forth what trade he used, and it might be that of a tinker or pedlar, who are rogues by the statute *Eliz.* so the words are not actionable. *2 Lev. 214.*

Cafe, &c. in which she declared, that she was skilled in dancing, and taught young women to dance, by which she gained a livelihood, and that the defendant, to injure her, said, *She is as much a man as I am, she is an hermaphrodite*; by which she lost divers scholars, but did not mention any in particular; after a verdict for the plaintiff, it was adjudged, that the words are not actionable, for it is no scandal to her profession to say, *she is an hermaphrodite*, for young women are commonly taught by men to dance, and here is no special damages laid. *2 Lev. 233.*

Cafe, &c. in which the plaintiff declared, that he is a trader, and that the defendant spake these words of him, *You are a cheat, and have been a cheat for many years*; not actionable, without laying a colloquium of his trade. *2 Salk. 694.*

Cafe for words spoken of a butcher, in which a colloquium was laid of a cow killed by him, and of the flesh of that cow; and that the defendant said, *The cow died with calving*, by reason whereof he lost such and such customers; there was a verdict for the plaintiff, &c. and upon a writ of error brought, the judgment was reversed, because the words in themselves are not actionable; it is true, here are special damages laid, but yet that will not help, because he did not allege, that he could not sell the cow, but only that he lost his customers. *2 Salk. 695.*

ACTION upon the statute, is brought upon the breach of a statute, whereby an action is given that lay not before;

fore; as where one commits perjury, to the prejudice of another, he who is damaged, shall have a writ upon the statute, that is, where the statute gives the suit or action to the party grieved, or otherwise to one person certain. *Cowel*.

ACTION, on a bill of exchange. An action of debt will not lie upon a bill of exchange accepted against the acceptor; but a special action of the case must be brought against him, because the acceptance does not create a duty, no more than a promise by a stranger to pay, &c. if the creditor will forbear his debt; and he that drew the bill continues debtor, notwithstanding the acceptance, which makes the acceptor liable to pay it, and the custom does not extend so far as to create a debt, but only makes the acceptor *onerabilis* to pay the money; wherefore and because no precedent could be produced, that an action of debt had been brought upon an accepted bill of exchange, judgment was arrested. *Anon.*

Assumpsit lies on a bill of exchange accepted, *per cur.* in case of the city of *London. v. Goree*.

A general *indebitatus assumpsit* does not lie on a bill of exchange, but the party ought to declare specially on the custom of merchants. *Frederick v. Cotton*.

A general *indebitatus assumpsit* will not lie upon a bill of exchange for want of consideration; for a bill is but evidence of a promise, and so but *nudum pactum*, and therefore a special action ought to be brought upon the case, upon the bill and custom of merchants, or else a general *indebitatus assumpsit* for money received to one's use, *per Holt*, chief justice. *Hodges v. Steward*.

Indebitatus assumpsit lies not against the acceptor of a bill of exchange, because his acceptance is but a collateral engagement; but it lies against the drawer himself, for he was really a debtor by the receipt of the money, and debt will lie against him. *Hart's case. Salk. 23.*

Assumpsit upon a bill of exchange. The plaintiff declares, that *secundum consuetudinem et usum mercatorum*, the acceptor is bound to pay, &c. without shewing the custom at large; and the defendant demurred, and it was adjudged for the plaintiff, and *per curiam* it is a better way, than to shew the whole at large. *Soper v. Dibble*.

Case. The plaintiff declares, *quod intra hoc regnum Angliæ* there is, and time whereof, &c. hath been a custom, that if two merchants are partners, jointly merchandizing together, and the one of them subscribes a bill for the payment of money by him and his partner, mentioned there to another or his order, that then both the partners are bound by the subscription of that single person; and that if the person to whom this bill is payable, indorses it payable to any other person, that then those partners ought to pay such bill upon notice, to him to whom it is made payable; then the plaintiff shews that J. S. and the defendant *Hall*, were partners jointly merchandizing, and that J. S. subscribed a bill of one hundred pounds payable to *Hutchins*, or his order, by himself and his partner, and that *Hutchins* indorsed *billam prædictam solubilem* to the plaintiff, that the defendant had notice thereof, and upon demand did not pay, &c. The defendant demurred. *Lord Raym. 175. Salk. 126. Molloy. b. 2. c. 10. sect. 29.*

1. Exc. That the declaration being *per consuetudinem Angliæ*, &c. was ill, because the custom of England is the law of England, of which the judges ought to take notice without pleading. *Sed non allocatur.* For though heretofore this has been allowed, yet of late time it has always been over-ruled; and in an action against a carrier, it is always laid *per consuetudinem Angliæ*, &c.

2. Exc. Though *lex mercatoria* is part of the law of England, yet it is but a particular custom among merchants, and therefore it ought to be shewn in London, or some other place, *sed non allocatur.* For the custom is not restrained to any particular place; and in *Hard. 485*, it is laid as here.

3. Exc. It is not said that the said J. S. promised for the defendant and himself upon the account of trade, and it may be, that this was for rent or some other thing, for which the partner is not liable. *Sed non allocatur.* For the plaintiff having declared so specially upon the custom of merchants, it shall be intended, this was for merchandizing, especially since the defendant has demurred generally; and if the case had

been otherwise, the defendant might have pleaded it.

4. Exc. That the declaration is, that *Hutchins indorsavit billam prædictam solubilem* to the plaintiff, which is nonsense; for it ought to be, that he indorsed the bill, that the defendant should pay, &c. *Sed non allocatur.* And judgment was given for the plaintiff. *Pinkney v. Hall.*

Assumpsit for forty pounds. The plaintiff declares upon a bill of exchange for twenty pounds, payable ten days after sight, and that the bill was seen by the defendant and accepted the fifth of May, and then he shews another *assumpsit* for the other twenty pounds, &c. The defendant craves *oyer* of the original, and upon that prays that the writ may abate *quoad primam promissionem*, because the original bears *teste* the 15th of May, and the bill was not payable until ten days after sight; *et quoad alteram promissionem*, he pleads in bar without defence. The plaintiff demurs. It was argued by the defendant's council, that if the bill be payable ten days after sight, the day of sight shall be taken exclusive, as well by reason of the word *post*, as because it is always so understood among merchants. But the court was of opinion, 1. That in real actions the writ may abate in part; but in personal actions a writ cannot abate in part. Therefore admitting that the day is excluded here, the writ must abate for the whole, or not at all. 2. That there is no fraction of a day in this case, but that it shall be entirely included or excluded in this case; for the law will never account for minutes or hours, to make priorities in a single day, unless it be to prevent a great mischief or inconvenience; and if a bond be made the first day of January, and this bond is released the same day, the bond may be averred to be made before the release. So if a *feme sole* bind herself in a bond, and the same day marries, one may aver, that she married after the bond delivered. In assize it appears, that the disseisin was done the same day on which the writ was *teste*; yet this shall not abate the writ, because the assize might be purchased after disseisin. 3. That if there is a custom among merchants, that the day of the sight shall be excluded, it ought to have been pleaded specially; for it is a special custom, of which the court cannot take knowledge without pleading. And *Powel*, justice, said, that the court would not take notice of the *lex mercatoria*, as that there is no survivorship, or of a general custom of gavelkind; but that such special custom as this here ought to be pleaded. And in an action upon a bill of exchange, unless the plaintiff declares upon a custom to support the *assumpsit* according to the common form, the action will not be maintainable. 4. *Powel* and *Nevil*, justices, were of opinion, that the day in this case ought to be included; so that the day on which the bill was shewn shall be reckoned one of the ten; for according to *Clayton's case*, and all the books, when the computation is to be made from an act done, the day on which the act was done must be included; because since there is no fraction in a day, that act relates to the first moment of the day in which it was done, and was as if it were then done. But when the computation is to be from the day itself, and not from an act done, there the day in which the act was done must be excluded by the express words of the parties. As if a lease be made to commence a *die datus*, the day is excluded; but if it be a *confectione*, which is an act done, the day of making shall be included. But *Treby*, chief justice, *contra*, held that if a bill be payable ten days after sight, the day of the sight cannot be accounted one of the ten days, but shall be excluded. 1. Because it may be seen the last minute of the day, and that may be intended as reasonably, as that it was seen the first minute. 2. The party may have the whole day to view the bill, and that is allowed him by the law. 3. Because the contrary construction seems absurd; for then if a bill be payable one day after sight, it must be paid the same day that it is seen, which is not the day after the sight, as the bill requires. As to *Clayton's case*, he admitted it was good law, but not contrary to his opinion: for if a man makes a lease the first of *Jan.* to have and to hold a *confectione* for a year, there the day of the making must be accounted one, because being a lease from the delivery, and to continue but for one year; unless the day

be included, the lease will not determine until the end of the first of Jan. the next year; and so there will be two first days of Jan. in the one year. But notwithstanding his opinion, because his brothers were of a contrary opinion, he awarded that the writ should stand, and that the defendant should answer over. *Note*, before this opinion of the court was pronounced, the defendant's counsel offered to take exceptions to the declaration, but the court refused to admit them; for *per curiam*, upon a plea to the writ, the defendant cannot take exceptions to the court before the writ be adjudged good, for then the defendant has time enough to take advantage of the declaration, and before it is needless; because if the writ be debated, that will determine the whole. After this it was objected, that the defendant had not made defence, and the question was, if this was matter of form, and so aided by the general demurrer, and *prima facie* the court was of opinion, that this was matter of substance, because the defendant is not party to the action without defence; but after having consulted the judges of the King's-Bench, where it has been a long time held matter of form, they agreed that it was aided by the general demurrer, though at the same time they seemed to comply with that opinion, rather than to approve it with their own judgment, to the end that there might be a conformity between the two courts. *Bellofs v. Hester*.

The plaintiff brought an action upon the case upon a bill of exchange against the defendant, and declared upon the custom of merchants, which he shewed to be thus; that if any merchant subscribes a bill, by which he promises to pay a sum of money to another man, or his order, and afterwards the person to whom the bill was made payable, indorses the said bill for the payment of the whole sum therein contained, or any part thereof, to another man, the first drawer is obliged to pay the sum so indorsed, to the person to whom it is indorsed payable; and there the plaintiff shews that the defendant *Cardy*, being a merchant, subscribed a bill for forty-six pounds, nineteen shillings, payable to *Blackman*, or his order; that *Blackman* indorsed forty-three pounds, four shillings of it, payable to the plaintiff, &c. The defendant joined in demurrer, and adjudged *per totam curiam*, that the declaration is ill. For a man cannot apportion such personal contract, as he cannot make a man liable to two actions, where by the contract he is liable but to one. As if A grants a rent-charge of twenty pounds per annum to B, B grants ten pounds to C, C cannot compel the tertenant to attorn. So if lands are conveyed with warranty to A and B, their heirs and assigns, if partition be made, the warranty is extinct. See *Hob. 25. Roll. and Osborne's case*. But if in the principal case the plaintiff had acknowledged the receipt of the three pounds, fifteen shillings, the declaration had been good; and though it was objected by Mr. *Northey* for the plaintiff, that the plaintiff had made payment of a part to be part of the custom, and therefore it was well enough by the custom. *Holt*, chief justice, answered, that this is not a particular local custom, but the common custom of merchants, of which the law takes notice; and therefore the court cannot take the custom to be so. And the whole court were of opinion, that judgment ought to be entered for the defendant. But upon the importunity of Mr. *Northey*, leave was given to the plaintiff, to discontinue upon payment of costs. *Hawkins v. Cardy*.

Assumpsit upon a bill of Exchange. The plaintiff declares, that J. S. drew a bill of exchange upon the defendant, dated the 25th of March, 1696, payable within one month after; that afterwards, viz. such a day in April, 1697, he shewed the bill to the defendant, and he promised to pay it, *secundum tenorem et effectum billæ prædictæ*. *Non assumpsit* pleaded, and verdict for the plaintiff. Sir *Bartholomew Shower* moved in arrest of judgment, that the promise was void, because impossible to be performed; the day of payment being past at the time of the acceptance of the bill, and so impossible to be performed *secundum tenorem et effectum billæ prædictæ*, all which appears upon the plaintiff's declaration. To which Mr. *Northey* for plaintiff answered, that it will amount to a promise to pay generally, of which opinion was the

whole court. And *Holt*, chief justice, took the distinction, when the day of payment is past at the time of the acceptance, as it was in this case, where the payment is to come. In the former case acceptance to pay *secundum tenorem et effectum billæ*, will amount to a general acceptance to pay the money; *contra* in the latter case. For in the former case it is impossible to pay the money as the bill appoints. But he said, that it had been better in the case, to have declared a general promise, without having restrained by the *tenorem effectum billæ*; and (by him) in such case the acceptance of a bill amounts to an express promise to pay it. But (by him) if the plaintiff declares, that the acceptance was before the day appointed for the payment, and that he accepted to pay it *secundum tenorem effectum billæ prædictæ*, and it appears upon the evidence, that the acceptance in fact was after the day of payment, that would lie against the defendant. Judgment for the plaintiff. *Jackson. v. Pigott*.

In an action upon the case upon a bill of exchange; the plaintiff in his declaration declared upon a bill of exchange, and that he offered it to the person upon whom it was drawn, and he refused to pay it, *per quod* the first drawer *devenit onerabilis per consuetudinem*, &c. and there was an *indebitatus assumpsit*, and a *quantum meruit*, in the declaration. Judgment by default, and a writ of enquiry of damages, and entire damages were given. And now it was moved in arrest of judgment, that as the matter stood upon the first count, this action was founded upon a deceit, the bill not being paid according to the warranty, every one who draws a bill warranting the payment of it; and therefore being in the nature of an action for a deceit, which is a *tort*, it cannot be joined with an *assumpsit*, which is founded upon a contract; and therefore for want of laying an express promise, it was ill, entire damages being given. *Northey* said, that the action was founded upon the custom, and that the obligation arose by that, and therefore the action is maintainable without shewing a promise. *Cro. Car. 302*. A declaration upon a bill of exchange, without shewing any promise, and the roll is so. Q. This founds all in contract, for the custom raises a promise in law, that the drawer will pay the money, if the person on whom it is drawn refuses to pay it. And 2 *Cro. 307*, says, that if a merchant accepts a bill, it has, by the custom, the force of a promise, to compel him to pay the money. *Holt*, chief justice, at the beginning seemed to agree with the objection, and said, that he who draws the bill warrants the payment of it; and if he does not, it is a deceit, and one may have an action upon it; but then they ought not to join it with an action upon a promise. That is the reason of the case of Sir *John Dalston* and *Johnson*. Mich. 7 W. III. B. R. ante 58, in the time of 2 *Cro.* they were not arrived at this way of declaring upon bills of exchange. *Gould*, justice, cited 1 *Sid. 306*, that if a man brings *assumpsit* for the arrears of an account, where the action formed is debt, he ought to lay an express promise, to maintain the action. *Holt* said, that the notion of promises in law was a metaphysical notion, for the law makes no promise but where there is a promise of the party. Afterwards in this term judgment was given for the plaintiff, because the drawing of the bill was an actual promise. *Ex relatione m'ri Jacob. Starke v. Cheeseman*.

Action upon a bill of exchange, and the plaintiff declared, that one *Milburn* drew a bill of exchange upon *George Walcup* in London, to be paid to the plaintiff's orders at double usance at Amsterdam, (and the bill was dated the 26th of October, 1699, and by that the double usance expired the 26th of December; and by the custom of merchants, the person upon whom a bill is drawn, hath three days of grace for the payment in England, and eight days of grace in Holland). The bill was tendered to *Walcup* on the 30th of December, who accepted it, by which he became liable, and *super hoc præd.* (the defendant) *eisdem die et anno super se assumpsit quod ipse præd. denarios in eadem billa content. eidem G. bene solvere et contentare vellet secundum tenorem et effectum billæ præd.* And it was moved, that this was ill by Sir *Barth. Shower* and *Dee*; for the bill was not tendered or accepted till the 30th of December, which

was the last day for the payment, then as the defendant promised (as it was alleged) on the same day, according to the effect of the bill, it was a thing impossible, for the payment was to be at *Amsterdam*, which could not be on the same day, and therefore the plaintiff had not declared well; for he ought to have said, that by the custom of merchants, if a bill was accepted, the acceptor obliged himself to make payment to the person who tendered it, &c. And Sir *Barth. Shower* said, it was proved at the trial by a public notary, that if a man accepted a bill payable at *Amsterdam*, he ought to assign a house where the money ought to be paid, otherwise it is not a good acceptance, and the bill may lie protested; and if this bill had been tendered within the term of the double usance, it might have been protested; but after the usances were expired, he doubted whether such protests could be made. But it was said on the other side, and resolved by the court, that the judgment should be for the plaintiff; for the allegation of any promise for payment was not needful, for the acceptance is an actual *assumpsit*, and the declaration need not allege more; and although some house where the money ought to be paid at *Amsterdam* should be named, otherwise the party may protest the bill, yet if it is accepted, the acceptor becomes liable thereby.

And *Holt*, C. J. said, that if a bill of exchange is drawn upon a man who refuses it, a stranger may accept it, for the honour of the drawer, and by such acceptance he becomes liable.

And it was agreed in the same case, that a bill of exchange, payable to the order of a person, shall be paid to him or his order, for it is tantamount. *Gregory and Walcup*.

William Murray brought an *action* against the defendant, Sir *John Erskine*, upon an inland bill of exchange, wherein he declared, that he, on the first of March, 1727, at Westminster in the county of Middlesex, made his bill of exchange in writing to the said Sir *John* directed, and by the said bill requested the said Sir *John*, upon the 10th day of the said month of March, to pay the said *William Murray*, or order, at his mansion-house, in Edinburgh, two hundred pounds sterling, *pro valore in manibus ipsius Johannis de denariis accommodatis de eodem Willielmo*; that the defendant, Sir *John*, accepted the bill, *ac ratione inde secundum consuetudinem mercatorum*, became liable to pay, &c. and being so liable, promised to pay the said two hundred pounds to the plaintiff *Murray*, &c. The defendant *Erskine*, let judgment go against him by *nihil dicit*, and after execution of a writ of enquiry, and final judgment given against him, he brought this writ of error.

The first exception took by Mr. *Wynne* and Mr. *Robinson*, counsel for the plaintiff, in error was, that it was not alleged that the bill was drawn according to the custom of merchants.

But to this it was answered by Mr. *Reeve*, counsel for the defendant in error, and so resolved by the court, that the law took notice of the custom of merchants, without setting it out specially; and if the bill, as set out in the declaration, appeared to be within the custom of merchants, it was sufficient; besides, after setting out the bill and acceptance, it is said, *ratione inde secundum consuetudinem mercatorum*, the defendant below became liable, which they held was sufficient.

The second exception was, that it was not averred, that the bill was signed by Mr. *Murray*.

The third exception was, that the defendant had not accepted the bill by underwriting the same under his hand. See 9 W. III. c. 17. and 3 and 4 Ann. c. 9. part 4, and 5.

As to the signing, it was answered, that it is alleged that the plaintiff made his bill of exchange in writing to the said Sir *John Erskine* directed, and by the said bill requested; which of necessity implies the plaintiff's name was written in the bill, else he could not request; and the saying he made the bill in writing imports he writ, or somebody by his authority writ, which will be the same thing, and imports a signing, which is necessary in case of inland bills of exchange. And such a way of declaring was held sufficient in cases of promissory notes, where the act 3 and 4 Ann. c. 9. requires,

that the party who makes the bill, or some person entrusted by him, should sign it. *Taylor v. Dobbins. Elliot v. Cooper*.

The fourth and last exception was, that the bill was not laid to be for value received; but it is *pro valore in manibus ipsius Johannis de denariis accommodatis eodem Willielmo*, not *eodem Willielmo*. But the court held, *pro valore in manibus ipsius Johannis* had been sufficient; and the other words may be rejected as surplusage; the court held, that the meaning was, lent by the said *William*, though the Latin might not be so correct; and the judgment of the common pleas was affirmed, Nov. 23, 1728. *Erskine v. Murray*.

Venus cannot be changed in an *action* on a bill of exchange. *Everett v. Sanjum. Ward v. Colclough*.

In point of evidence, an *action* on a bill of exchange, being by an executor, and upon a debt laid to be due to testator, *Holt* held it necessary to prove the acceptance was in the testator's time. *Anon*.

In an *action* by the indorsee of a bill of exchange against the acceptor, it was held not to be necessary to prove the hand of the drawer; and the plaintiff rested on the proof of the acceptance. The defendant offered to prove it a forged bill, by calling persons who were acquainted with the hand of the drawer, and would swear they did not believe it to be his hand. But the chief justice would not admit this, from the danger to negotiable notes, and because a man might with design write contrary to his usual method, and he strongly inclined, that even actual proof of forgery would not excuse the defendants against their own acceptance, which had given the bill a credit to the evidence. *Jenys v. Fowler, et al.*

A gives B a bill of exchange on C, in payment of a former debt; this will not be allowed as evidence on non *assumpsit*, unless paid, though B kept it in his hands long after it was payable. *Clarke v. Munday*.

As to notice given by the indorsee to the acceptor, before he commenced his *action*, that he must provide the money, it was offered in evidence, that he gave him notice by sending him a letter to do so; but the chief justice said, that he did not think the bare sending a letter to the post-house would be sufficient evidence of notice, without some further proofs of the acceptor's receiving it; and besides he said, that generally a personal demand is expected. *Dale v. Lubeck*.

Plaintiff had a bill of exchange drawn on the defendant, which he indorsed, and delivered to J. S. who went to the defendant to get it accepted. J. S. left it with him, and it was afterwards lost, thereupon they brought trover. The court were all of opinion, that the bare indorsement, without any other words purporting an assignment, does not make alteration of the property; for it may still be filled up either with a receipt on an assignment, and consequently J. S. is a good witness. *Lucas v. Haines*.

In a case upon a bill of exchange, upon the evidence at the trial before *Holt*, chief justice, at Guildhall, Nov. 23, Mich. 12 W. III. the case was thus: A draws a bill of exchange upon B, payable to C at Paris; B accepted the bill, C indorsed it, payable to D, D to E, E to F, F to G; G demanded the bill to be paid by B, and upon non-payment G protested it within the time, &c. And then G brought an *action* against D, and it was well brought, and he recovered. Afterwards D brought an *action* against B, and though D produced the bill and the protest, yet because he could not produce a receipt for the money paid by him to G, upon the protest, as the custom is among merchants, as several merchants upon their oaths affirmed, he was nonsuited. But *Holt* seemed to be of opinion, that if he had proved payment by him to G, it had been well enough. *Mendez v. Careroon*.

Indorsee need not prove the drawer's hand, because though it be a forged bill, the indorser is bound to pay it. *Lambert v. Packe*.

Indorsee need not prove any demand on drawer, Plaintiff to shew a protest, produced an instrument attested by a notary public; and though it was insisted upon that he should prove this instrument, or at least give some account how he came by it, *Holt* ruled it not

to be necessary; for that, he said, would destroy commerce and public transactions of this nature. *Anon.*

Original drawer, who was offered as an evidence in an *action* upon a bill of exchange, to prove that he did not draw the bill, was denied, because at last the burthen must fall upon him; but was admitted, upon having a release executed to him in court. *Dupays v. Shepherd.*

As to the recovery of *interest* and *damages*: *Interest* on bills of exchange commences from demand made, and therefore, if there was no demand made till *action* brought, the defendant may plead tender and refusal, and *Uncore Prist.* and so discharge himself of interest; but if it be the defendant's fault that the demand could not be made, as if he were out of the kingdom, there want of demand ought not to prejudice the plaintiff. *Per. Cur. Anon.*

Drawee accepts the bill, and some time after protests it, and thereupon the bill is indorced to the drawer, who brings an *action* as indorsee, and held well, and interest was ruled to be paid from the time of the protest. *Louviere v. Laubray.*

"No acceptance of any inland bill shall charge any person, unless underwritten or indorced, and if not so underwritten or indorced, no drawer to pay costs, damages, or interest, unless protest be made for non-acceptance, and within fourteen days after protest the same be sent, or notice thereof given, to the party from whom such bill was received, or left in writing at his usual place of abode; and if such bill be accepted, and not paid within three days after due, no drawer shall pay costs, damages, or interest thereon, unless protest be made and sent, or notice given as aforesaid; nevertheless, the drawer shall be liable to the payment of costs, damages, and interest, if any one protest be made for non-acceptance, or non-payment, and notice be sent, given, or left." 3 and 4 Ann. c. 9. sect. 5.

Since the above statute, it has been adjudged, that an indorsee of an inland bill of exchange may maintain an *action* against the acceptor, on a parol acceptance, as to the principal sum, though not as to interest and costs; for the act being made to give a further remedy for interest, damages, and costs against the drawer, cannot be supposed to take any advantage from the payee, which he had before; and therefore the true construction of the act is, that to charge the drawer with interest and costs, the drawee must refuse to accept it in writing; nevertheless, if he accept the bill by parol, he is liable to the principal sum in the bill, as he would have been before the act. *Lumley v. Palmer.* See the last case but one under the article ACCEPTANCE, as to interest.

In an *action* against the drawer of an inland bill after an acceptance, the chief justice ruled, that for want of protest, according to 9 and 10 W. III. c. 17. the drawer could not be charged with interest. Then the plaintiff would have had it as for money lent, and that appeared to be the consideration of the bill; but the chief justice said it had never been allowed barely for money lent, without a note, so the plaintiff had no interest allowed him. *Harris v. Benson.*

The bill being payable thirty days after sight, the jury gave interest from thirty days after the date of a letter, which acknowledged the receipt of the bill. *Wilkinson v. Lutteridge.*

Equity and *injunction* in regard to bills of exchange may be stated as follows: A requested B to let him have fifty pounds in London, and he would draw a bill on C in the country to repay it to B, as soon as B should return home. B gave two bills to A, one for twenty pounds, and another for thirty pounds, payable at twenty days sight, which the drawee accepted. On B's return, the drawee in the country refused to pay A's bill. B on this writes to stop payment of his bills, but one was paid before, but the drawee refused to pay A the other. Decreed, A to pay back the twenty pounds received, and a perpetual injunction against A for the other thirty pounds. *Hill and Penford v. Baker.*

Bill for relief against a bill of exchange, on pretence of its being gained by threats or menaces, is not proper for *equity*, it being a matter at law, and *Durefs* a good plea there; but being gained by fraud, and for a fictitious consideration, it was relieved *per* commissioners.

Dyer v. Tymewell. See last case but one under the article of ACCEPTANCE.

The following cases serve to illustrate when a bill of exchange may be deemed payment.

1. *Griffith* sold to *Pope* glasses for twenty-five pounds, for which *Pope* gave him a bill drawn by himself on one *Samuel Lobs*, for the same sum, and *Griffith* gave him a receipt for the bill. *Lobs* accepted the bill, but afterwards proved insolvent, and never paid; and three years after, and not before, the plaintiff acquainted the defendant with it, and then brought an *indebitatus assumpsit* for the value of the glasses.

The defendant, on *non-assumpsit*, gave the delivery of this bill in evidence; and the chief justice directed the jury, that if this bill was accepted for payment, unless refused, and the bill returned, and notice given to the drawer in a reasonable time; he said, the plaintiff's keeping the bill so long was evidence of his accepting it as payment; and accordingly the jury found for the defendant. *Griffith v. Pope.*

2. A bill of exchange shall never go in payment of a precedent debt, unless it be part of the contract that it should be so. *Clarke v. Mundal.*

3. A sells goods to B, and B is to give a bill in satisfaction; B is discharged, though the bill is never paid, for the bill is payment; but otherwise a bill should never discharge a precedent debt, or contract; but if part be received, it shall only be a discharge of the old debt for so much.

A bill of exchange is not payment, unless the party omits receiving it in a reasonable time, as three days, when he might have received it; but if he gives a receipt, and accepts the bill as payment, this shall bind him. *Sir Charles Thorold v. Smith.*

ACTIONS, in regard to the customs. Actions, suits, bills, or indictments for frauds relating to the customs, may be laid in any county; and on *actions* for forfeitures upon penal statutes, any officer, &c. may sue within a year; which being expired, the king may sue within two years more, unless shorter time be appointed by any other statute. 31 Eliz. c. 5. sect. 5, 6. 21 Jac. I. c. 4. sect. 3. 5.

But for draw-back goods relanded, suit may be within five years after offence committed. 8 Ann. c. 13. sect. 16.

Informer or plaintiff may not compound or agree with the offender, but after answer made in court to the information; nor after answer, but by order and consent of the court; and if the informer, &c. delay, or discontinue his suit, or is nonsuited, or has verdict passed against him, he must pay the defendant his costs, charges, and damages. 18 Eliz. c. 5. sect. 3. 27 Eliz. c. 10. sect. 2.

In every *action*, suit, indictment, information, or prosecution commenced against officers of the customs, &c. for any matter or thing done by virtue, or in pursuance, or execution of the act of 13 and 14 Car. 2. c. 11. sect. 16. And the several other acts on which the officers are to proceed, or any other act relating to the customs and navigation, the defendants may plead the general issue, and give those particular acts, and the special matter in evidence for their defence, in any of the courts of justice; and if, upon trial, a verdict pass for the defendants, or the plaintiffs discontinue or forbear their *actions*, or become nonsuited, or judgment be given against them by demurrer or otherwise, the defendants are to have (full, double and treble) costs of suits awarded against such plaintiffs, &c.

ACTIONS in regard to insurances. A made a policy, and declared under his hand, on the back, that the insurance was made for and on the account of B; and afterwards A brought an *action* on the policy; and though the declaration of B's interest appeared at the trial, *Lee*, chief justice, was of opinion, that A notwithstanding, might maintain the *action*, and verdict for the plaintiff.

An insurance made in a foreign country may be sued in England, if the assurers come here.

If a man in a foreign country insures a ship from any place there to London, and the ship is lost, the assurer, L if

if he comes into England, shall answer by our law here; for the promise is transitory, and not fixed to the place where made: and so it was resolved, where a person abroad, in consideration of ten pounds, had insured, that if the English merchant's ship did not come safe to London, he would pay one hundred pounds: afterwards the ship was robbed on the sea; and, in an *action* brought for the one hundred pounds, the merchant had judgment, though the subscription was out of the realm.

In *indebitatus assumpsit*, by B. for five pounds received to the plaintiff's use, and *non assumpsit* pleaded; the case was, that A took a policy of insurance upon account, for five pounds premium, in the name of B; and A paid the said premium to J. S. and A: and then no goods on board; and so the policy was void; and so the money to be returned by the custom of merchants. It was insisted, that the *action* ought to have been in A's name, for the money was his; and if the policy was good, it would have been to his advantage; and it could no wife be said, to be received to B's use, it never being his money. Besides, here may be a great fraud upon all in insurers in this, that an insurance may be made in another's name; and, if a loss happen, then the insurer shall pay; for that some *cestuique trust* had goods on board; but, if the ship arrives, then the nominal trustee shall bring an *indebitatus assumpsit* for the premium, as having no goods on board.

To all which *Holt*, chief justice, answered, that the policy being in B's name, the premium was paid in his name, and as his money; and he must bring the *action* upon a loss; and so, upon a voidance of the policy, to recover back the premium: and as to the inconveniences, it would be the same, whosoever was to bring the *action*; and therefore the insurers ought with caution to look to that before hand. *Martin v. Sitwell*.

B having the command of a merchant ship, and likewise a share in her as being an owner, 1730, desired A by letter to get two hundred pounds insured on her. An insurance was made in the name of A, the agent, by B's direction; the insurers, J. S. and F. S. knowing nothing of B. In the voyage, the ship was lost, and B, the captain cast away. M, the administratrix of B, gave J. S. and F. S. notice of the loss and the trust, and required payment to her only. But A, under a pretence that B was indebted to him, procured the insurers to give credit for the sum in an account which they afterwards made up with him; and then the balance of that account was carried into a new account; and this second account was afterwards settled between them. Upon a bill by M to be relieved, it was decreed, that the insurers pay her the money, and A to pay the costs of suit, deducting thereout the charges he had been at in obtaining the policy. *Fell v. Lutwidge*.

This was an *action* upon the case brought upon a policy of insurance, in which the plaintiff declared as follows:

London.

Gyles Rook complains of *John Thurmond*, being in the custody of the marshal of the Marshalsea of our lord the king, before the king himself, for that whereas the said *Gyles Rook*, on the fifth day of October, in the year of our Lord 1741, at London, aforesaid (to wit, in the parish of St. Mary le Bow, &c.) according to the custom of merchants from time immemorial used and approved of, caused to be made a certain writing, or policy of assurance, purporting thereby, and containing therein, that one *Caleb Smith*, as well in his own name as for and in the name and names of all and every other person or persons to whom the same did, might, or should appertain, in part, or in all, did make assurance, and caused himself and them, and every of them, to be insured, lost or not lost, at and from *South Carolina* to *Cowes*, upon the body, tackle, apparel, ordnance, ammunition, artillery, boat, and other furniture, of and in the good ship or vessel called the *Polly*, whereof was master, under God, for that then present voyage, captain *William Henry*, or whosoever should go for master in the said ship, or by whatsoever name or names the same ship, or the master thereof, was or should be named or called, beginning the adventure upon the said ship, &c.

from and immediately following her first arrival there; and so should continue and endure until the said ship, with the said tackle, apparel, &c. should be arrived at *Cowes*, and there had moored at anchor twenty-four hours in good safety, and it should be lawful for the said ship in the voyage to proceed and sail to, and touch and stay at any port or place whatsoever, without prejudice to that insurance. The said ship, &c. for so much as concerned the assured, was and should be valued at interest or no interest, free from average, and without benefit of salvage, without farther account to be given by the assureds for the same, touching the adventures and perils which the assurers were contented to bear, and did take upon them in that voyage, whether they were of the seas, men of war, fire, enemies, pirates, rovers, thieves, jettisons, letters of mark and countermark, surprisals, takings at sea, arrests, restraints and detentions of all kings, princes, and people, of what nation, condition, or quality soever, barratry of the master and mariners, and of all other perils, losses and misfortunes that had or should come to the hurt, detriment, or damage of the said ship, &c. or any part thereof; and in case of loss or misfortune, it should be lawful to the assureds, their servants, factors, and assigns, to sue, labour, and travel for, in and about the defence, safeguard, and recovery of the said ship, &c. or any part thereof, without prejudice to that insurance, to the charges whereof they the assurers would contribute each one according to the rate and quantity of his sum therein assured. And it was agreed by them the assurers, that the said writing, or policy of assurance, should be of as much force and effect, as the surest writing, or policy of assurance, heretofore made in *Lombard-street*, or on the *Royal Exchange*, or elsewhere in *London*. And so they the assurers were contented, and did thereby promise and bind themselves, each for his own part; their heirs, executors, and goods, to the assureds, their executors, administrators, and assigns, for the true performance of the premises, confessing themselves paid the consideration due unto them for that assurance by the assured, at and after the rate of 5 l. 15 s. per cent. and in case of loss (which God forbid) the assured to abate two pounds per cent. And the said *Gyles* avers, that the said policy of assurance was so made as aforesaid in the name of the said *Caleb Smith*, on the account and risque of the said *Gyles*, and that the said *Gyles*, at the time of making thereof, was solely interested therein. Of all which premises the said *John* afterwards, to wit, on the day and year aforesaid, at *London* aforesaid, and in the parish and ward aforesaid, in consideration that the said *Gyles*, at the special instance and request of the said *John*, had then and there paid to the said *John* the sum of five pounds fifteen shillings as a premium and reward for the insurance of one hundred pounds, of and upon the premises in the said policy mentioned; and had undertaken, and faithfully promised to perform and fulfil every thing in the said policy of assurance contained, on the part and behalf of the assured to be performed and fulfilled; he the said *John* undertook, and then and there faithfully promised the said *Gyles*, that he would become an assurer to the said *Gyles* for the said one hundred pounds, of and upon the premises in the said policy mentioned; and that he would perform and fulfil every thing in the said policy contained on his part and behalf, as such assurer, as to the said one hundred pounds to be performed and fulfilled, and then and there subscribed the said policy, as such assurer for the said one hundred pounds; and the said *Gyles* in fact saith, that before the making of the said policy, viz. on the first day of May, in the year of our Lord 1741, the said ship, or vessel, with all her apparel, and other furniture, first arrived at *South Carolina* aforesaid, and afterwards, to wit, on the twelfth day of July, in the year of our Lord 1741, aforesaid, the said ship, or vessel, with all her apparel and other furniture, departed and sailed from *South Carolina* aforesaid towards *Cowes* aforesaid, and proceeded on her said voyage to the port of *Cowes* aforesaid, and afterwards, to wit, on the 18th day of July, in the year last aforesaid, the said ship or vessel, with all her tackle, boat, and other furniture, so proceeding in her said voyage towards the port of *Cowes* aforesaid,

aforesaid, before her arrival at the port of *Cowes* aforesaid, on the high seas, was with force and arms in an hostile manner, attacked, conquered, and taken as a prize by certain enemies of our lord the king and his crown of England, to wit, by *Spaniards* and subjects of the king of *Spain*; and the said ship, or vessel, with all her tackle and other furniture, were thereby then and there wholly lost, and never did arrive at the port of *Cowes* aforesaid; of all which said premises the said *John* afterwards, to wit, on the first day of December, in the year of our Lord 1741, aforesaid, at *London* aforesaid, in the parish and ward aforesaid, had notice, and was then and there requested by the said *Gyles*, to pay him ninety-eight pounds, parcel of the said one hundred pounds, two pounds residue of the said one hundred pounds being to be abated to the said *John* on account of the loss aforesaid, which ninety-eight pounds the said *John* ought to have paid the said *Gyles*, according to his said promise and undertaking; yet the said *John*, not regarding his said promise and undertaking, but contriving, and fraudulently intending, craftily and subtly to deceive and defraud the said *Gyles*, in this particular, hath not yet paid the said sum of money, or any part thereof, to the said *Gyles* (although so to do, the said *John* by the said *Gyles*, was requested afterwards on the day and year last aforesaid, at *London* aforesaid) but he to pay the same to him had hitherto wholly refused, and still refuses.

There was another count for five pounds fifteen shillings for money had and received by the defendant for the use of the plaintiff. Damages laid, one hundred pounds.

The defendant pleaded the general issue *non assumpsit*, and issue was thereon joined.

Upon this case it was clearly taken at the trial before *Lee*, C. J. without any objection or question made upon it, that the plaintiff was well intitled to maintain this action upon the policy of insurance made in the name of *Caleb Smith*, who was the policy-broker employed to procure the insurances, he having by indorsement upon the policy acknowledged and declared, that the policy was made in his name, upon the account, and for the sole risk and benefit of the plaintiff, and *Smith* was allowed without any objection to prove the underwriting by the defendant and his own indorsement.

In this case the defence insisted on for the defendant underwriting this policy was, that the plaintiff had been informed by a letter wrote from *Carolina*, by a ship called the *Collet*, to one Mr. *Crockatt*, that the *Polly*, the ship insured, had sailed ten days, or a fortnight, from *Carolina* before the ship *Collet*, and that the ship *Collet* had arrived in England about seven days before the insurance was made, and the plaintiff had not informed the defendant of this, which was insisted on to be a fraud in the plaintiff sufficient to discharge the defendant of this insurance, it being, as was insisted, a settled and established rule, that on making an insurance, all material circumstances relating to the adventure ought to be disclosed to the insurer for him to judge upon; and the chief justice allowed this rule, and declared his opinion, that the concealment insisted on was a sufficient circumstance to discharge the defendant from the policy; for he said, that these contracts are made upon a mutual faith and credit, and that to conceal such circumstances which make any difference in the adventure, is fraudulent, for the insurer ought to have the advantage of judgment upon them, and that where there is such concealment, the insurance ought not to bind. But the defendant not being able to make out this fact to the satisfaction of the jury, the plaintiff had a verdict.

N. B. In this case the insurance was a re-insurance, and it was said by several policy-brokers, that when policies are made interest or no interest, it is generally in such cases of re-insurances. *Rooke v. Thurmond*.

The plaintiff caused himself to be insured on the *Prince Frederick*, from *Vera Cruz* to *London*, interest or no interest, free of average, and without benefit of salvage.

The ship was afterwards seized by order of the viceroy of *Mexico*, and the Spaniards turned her into a man of war, called her the *St. Philip*, and sent her as commodore with a squadron of Spanish men of war to the

Havanna, they having first taken out the *South-Sea* company's arms, and made several alterations in her; and there was a war between *England* and *Spain*, and *Gibraltar* was actually besieged by the Spaniards.

The defendants proved the signing of preliminary articles of peace before the seizure of the ship, and therefore insisted that this seizure did not alter the property, and consequently the defendants were not liable; for if the property was not altered, this insurance made by the plaintiff, who had no interest, cannot bind, as nothing comes within the policy but a total loss, and though there be these general words in the policy, *restraint or detention by princes, Hardwicke*, chief justice, declared,

First, that a war might begin without an actual declaration by proclamation, as in this case, by laying siege to *Gibraltar*, a garrison town, though there might be depredations at sea between princes in amity, for which letters of marque, &c. might be granted.

Secondly, as a war may begin by hostilities only, so it may end by cessation of arms; and these preliminary articles being signed before the seizure of the ship, and there being a cessation of arms, he thought the ship being taken afterwards not to be a taking by enemies, unless the jury took the caption to begin from the time the arms were seized, which was before the articles, and that was left to the jury.

Thirdly, supposing the ship not taken by enemies, *quære*, whether this detention for near the space of a year was, in those sorts of policies, viz. interest or no interest, a detention within the policy, or whether in such policies the insurers are ever liable but in case of a total loss; and if so, this ship being afterwards restored, then he directed the jury to find for the defendant. This, he said, depended on the custom or usage among merchants, and the jury gave a verdict for the defendant, but did not declare upon what point; but they must be of opinion she was not seized in time of war, and that therefore the policy being interest or no interest, the assurers were not liable, because there was no total loss.

In this case the insurance was made by one *Deflores* for the plaintiff, and *Deflores* wrote his name on the policy, and before the trial it was filled up with these words, *I made this for the benefit of Spencer*, and no date; and it was admitted the action was well brought by *Cestuique Trust*. *Spencer and Franco*.—See INSURANCES.

ACTION in regard to promissory notes. 1. Actions to be brought upon promissory notes, shall be brought within the time appointed for bringing action by 21 Jac. c. 16. 3 and 4 Ann. c. 9. sect. 2.

Upon a promissory note dated in 1704, the defendant pleaded *actio non accrevit infra sex annos*: the plaintiff replied a bill filed 12 Ann. and after verdict the judgment was arrested, because in this case the day is material. *Cole and Hawkins. O. Stafford v. Forcer*.

2. The plaintiff declared that the defendant, *fecit quandam notam in scriptis per quam promisit solvere*: and exception was taken, that here is no signing by the defendant, as the statute requires; and the case, *Taylor versus Dobbins*, had the words *manu sua scripta*, which was the ground of the judgment in that case. But in the principal case the court held, it was well enough, for unless it was signed or wrote by him, it could not be such a note whereby the defendant promised to pay. Judgment for the plaintiff. *Elliot v. Cowper. Boyce v. Fisher*.

3. Debt upon two promissory notes and a *mutuatus*; and, on demurrer to the declaration, I objected that an action of debt would not lie; and before the statute no action at all lay upon the note, as a note, (*Salk. 129*); nor did an *indebitatus assumpsit* lie on a bill of exchange. And the only remedy given upon the note by the statute, is the same that was before on an inland bill of exchange. And of this opinion was the court, and pronounced judgment for the defendant. But then it was observed by serjeant *Comyns*, for the plaintiff, that there was one good count upon the *mutuatus*, and the demurrer was to the whole. Whereupon judgment was given for the plaintiff, which I believe it will be difficult for him to enter, so as to maintain it. *Welsh v. Craig*.

4. Case upon a promissory note. And the declaration set forth, that the defendant and another did *conjunctim vel divisim* promise to pay. *Demurrer inde*; and for the defendant,

defendant, it was insisted, that the *action* should have been brought against both. *Et per Parker*, chief justice. The plaintiff might have brought it against either or both, for he had his election if the *action* had been against both, he should have declared as he now does; but that is not right in the *action* against the one only, for he should have declared generally, that this defendant, by his note, promised to pay, and a several note by two would have been good evidence; as where there are several obligors, and one only sued, no mention is made in the declaration of the other obligors. Suppose the note had been to pay fifty pounds, or one hundred pounds, the plaintiff is intitled to either, but uncertain which, till he has made his election; for he that speaks in the disjunctive says true, if either member of the disjunctive be verified; whereas, he that speaks in the affirmative, affirms both parts to be true.

The plaintiff prayed leave to discontinue, on payment of costs, which was granted; and at another day moved, that he might change his rule to one to amend on payment of costs; but this last motion was denied. *Butler v. Maliffy. Ovington v. Neale.*

In case, upon a promissory note, the declaration ran, that the defendant made a note *et manu sua propria scriptum*. Exception was taken, that since the statute he should have said, that the defendant signed the note, but the court held it well enough, because said to be wrote with his own hand; and there needs no subscription in that case, for it is sufficient his name is in any part of it. I J. S. promise to pay, is as good as I promise to pay, subscribed J. S. *Taylor v. Dobbins.*

The plaintiff brought an *action* upon the case against the defendant upon several promises. One count was made upon a general *indebitatus assumpsit*, for money lent to the defendant. Another count was upon the custom of merchants, as upon a bill of exchange; and shewed, that the defendant gave a note subscribed by himself; by which he promised to pay ————— to the plaintiff or his order, &c. Upon *non assumpsit*, a verdict was given for the plaintiff and entire damages. And it was moved, in arrest of judgment, that this note was not a bill of exchange within the custom of merchants; and therefore, the plaintiff having declared upon it as such, was wrong: but that the proper way in such cases is to declare upon a general *indebitatus assumpsit*, for money lent, and the note would be good evidence of it. But it was argued, by Sir Bartholomew Shower, in Michaelmas term for the plaintiff, that his note, being payable to the plaintiff or his order, was a bill of exchange, inasmuch as by its nature it was negociable: and that distinguishes it from a note payable to J. S. or bearer, which he admitted was not a bill of exchange, because it is not assignable, nor indorsable by the intent of the subscriber; and consequently, and therefore, it cannot be a bill of exchange, because it is incident to the nature of a bill of exchange to be negociable: but here this is negociable, for if it had been denied to J. N. J. N. might have brought his *action* upon it as upon a bill of exchange, and might have declared upon the custom of merchants. Why then should it not be before such indorsement a bill of exchange to the plaintiff himself, since the defendant, by his subscription, has shewn his intent, to be liable to the payment of this money to the plaintiff or his order; and since he hath thereby agreed, that it shall be assignable over, which is by consequence that it shall be a bill of exchange; that there is no difference in reason betwixt a note which saith, I promise to pay to J. S. or order, &c. and a note, which saith, I pray you to pay to J. S. or order, &c. They are both equally negociable; and to make such a note a bill of exchange can be no wrong to the defendant, because he, by the signing of the note, has made himself to that purpose a merchant, (2 Ventr. 292. *Sarsfield v. Witherly.*) and has given his consent, that his note shall be negotiated, and thereby has subjected himself to the law of merchants. But *Holt*, chief justice, was *totis viribus* against the *action*, and said, this note could not be a bill of exchange; that the maintaining these *actions* upon such notes, were innovations upon the rules of the common law; and that it amounted to the setting up a new sort of specialty, unknown to the common law, and invented in Lombard-

street, which attempted in these matters of bills of exchange to give laws to Westminster-hall; that the continuing to declare upon these notes upon the custom of merchants proceeded from obstinacy or opinionativeness, since he had always expressed his opinion against them; and since there was so easy a method as to declare upon a general *indebitatus assumpsit* for money lent, &c. As to the case of *Sarsfield v. Witherly*, he said he was not satisfied with the judgment of the King's-Bench; and that he advised the bringing of a writ of error.

Gould, justice, said, that he did not remember it had ever been adjudged, that a note, in which the subscriber promised to pay, &c. to J. S. or bearer, was not a bill of exchange: that the bearer could not sue an *action* upon such a note in his own name, is without doubt, and so it was resolved between *Horton and Coggs*, now printed in 3 *Læv.* 299; but that it was never resolved, that the party himself (to whom such note was payable) could not have an *action* upon the custom of merchants upon such a bill. But *Holt*, chief justice, answered, that it was held, in the same case of *Horton v. Coggs*, that such a note was not a bill of exchange within the custom of merchants: and afterwards, in the Easter-term, it was moved again, and the court continued to be of opinion against the *action*; and Mr. *Brantwaite*, for the plaintiff, urged, that if this note was not a bill of exchange within the custom of merchants, then the promise found upon it was void; and then it could not be intended that any damage was given by the jury for the breach of, but all the damages must be intended to have been upon the general *indebitatus assumpsit*. *Holt*, chief justice, said, that would be true, if it had been void by reason of its being infensible; but this matter is sensible enough, though not sufficient in law to raise a promise; and therefore one cannot intend, but that damages were given for it; and consequently that judgment must be arrested. And judgment was given, *quod querens nil capiat per billam*, &c. by the opinion of the whole court. *Clerke v. Martin. Potter v. Pearson. Burton v. Souter.*

In an *action* upon a promissory note, Mr. *Acherly* moved in arrest of judgment, that the plaintiff had declared, upon the statute of 3 Ann. c. 9. which provides, that a man shall have the same remedy upon a promissory note, as upon a bill of exchange; and therefore he ought to declare in the same manner upon both. Now, in *actions* upon bills of exchange, it has been determined, that it is not enough barely to set forth, that a bill of exchange was drawn; but the party ought to conclude, and *sic indebitatus existens super se assumpsit*, so as to alledge an express promise; and for the same reason he urged, that it is not enough for the plaintiff to set forth here, that the defendant *fecit notam promissoriam*: but he ought to go on, and make the same conclusion as aforementioned; otherwise, he said the issue could only be *non fecit notam promissoriam*, and not *non assumpsit*, as the constant method in these cases is. Now, in the present declaration, he said this conclusion is wholly omitted. Mr. *Lee*, on the other side, answered, that this very exception was expressly over-ruled in the case of *Conyers and Lowther*; and the court were of the same opinion. Judge *Page* said, that this matter has been doubted, even in the case of a bill of exchange, though now it is settled: but the reason for that he took to be, that a bill of exchange is only an order upon a third person to pay, and no express promise at all; whereas in the present case there is. *Dutton* and his wife against *Staples*.

Case upon a promissory note, which ran thus, "I promise to pay to A. B. eight pounds, so much being due from me to C. D. my landlady, at Lady-day next, who is indebted in that sum to A. B." Upon the trial, it appeared the landlady died before Lady-day, whereby the reversioner became entitled to the rent; and therefore it was insisted for the defendant, "That the note was only conditional, for it could not be supposed he intended to oblige himself to pay the rent twice." But the chief justice held, that as to the plaintiff, the death of C. D. signified nothing, for the note was due on demand; and the mentioning upon what account the money would be due, for which the defendant obliged himself,

self, can only be taken as an intention to shew he had answered the rent to her if she should come upon him for it when it became due. The plaintiff recovered. *Anon.*

An *action* was brought by the indorsee of a promissory note to A, or order; and it was proved before trial, on behalf of the defendant, that the plaintiff might produce the note, and leave it with his attorney, in order to be inspected by the defendant, his attorney, &c. on a suggestion that the note was forged; and it was insisted for the defendant, that since even a bond, upon such motion, might be produced, much more might a note: but it was answered, by the council for the plaintiff, and *per curiam*, though a bond might be produced, being under hand and seal, yet that was upon this occasion, that the plaintiff declares upon it, with a *proferit in curia*, yet there is no instance that in this, or such a case, a plaintiff was ever obliged to produce his evidence of what is the foundation of his action; and the statute 3 and 4 Ann. c. 9. makes no difference between these notes and inland bills of exchange, but in the point of pleading; and there is no instance since the statute (which must have often happened) that ever such a motion was made, or granted; nor before the statute, that ever a bill of exchange was produced upon such motion. *Odams v. the Duke of Grafton.*

In the case, upon *assumpsit*, the plaintiff declared that the defendant, in consideration that the plaintiff, at the special request of the defendant, *deliberasset* to the defendant *quandam notam*, by which one *Hurst* assumed to pay to the plaintiff an hundred guineas, assumed to pay to the plaintiff, &c. Upon *non assumpsit* pleaded, verdict for the plaintiff. And now Mr. *Gilbert* moved in arrest of judgment, that the consideration of this promise was not good, since it did not appear that *Hurst* gave this note to the plaintiff upon any good consideration, and consequently said the note would be void, and then the delivery of the said note by the plaintiff to the defendant would be no prejudice to the plaintiff, nor advantage to the defendant: but it was resolved, *per totam curiam*, that this was a good consideration; for, though no consideration was expressed in *Hurst's* note, yet the note being subscribed by *Hurst*, was good evidence of a debt due from *Hurst* to the plaintiff, and therefore the delivery of the evidence of his debt to the defendant, at his request, was a good consideration of the *assumpsit* of the defendant, upon which this action was brought, and judgment was given for the plaintiff. Note, *Holt*, chief justice, said, that he was of opinion, upon the trial, that it was not necessary for the plaintiff to prove upon what consideration the note of *Hurst's* was given, the defendant having admitted it to have been given upon good consideration by his promise. *Meredith v. Chute.* For further particulars and adjudged cases on this head, see PROMISSORY NOTES, INDORSEMENTS, &c.

ACTION for usury. In such action the statute against usury must be pleaded, and a corrupt agreement set forth: it is not sufficient to plead the statute, and say that for the lending of 20l. the defendant took more than 5l. per cent. without setting forth a corrupt agreement or contract.

And in pleading an usurious contract by way of bar to an action, the whole matter is to be set forth specially, because it lay within the party's own privacy; but in an information on the statute, for making such a contract, it is enough to mention the corrupt bargain generally, by reason matters of this kind are supposed to be privily transacted; and such information may be brought by a stranger.

ACTION, in French commerce, signifies sometimes moveable effects: thus they say, that a merchant's creditors have seized upon all his *actions*; which is as much as to say, that they have taken possession of all his active debts, that is, the debts owing to him.

ACTION Rehabitory, is an *action* at law, by which the buyer may oblige the seller to take back damaged goods, or such as do not prove according to the agreement.

ACTION of a company, is an equal part, or portion of stock, of which several, joined together, make the capital fund, or stock, of a trading company. Thus a company, which has 300 actions, of 1000l. each, has a

fund of 300,000l. which is to be understood in proportion as the *actions* are settled at a larger or smaller sum. A merchant, or any other person, is said to have four or six actions in a company, where he has contributed to the capital stock, and is concerned in it for, 4, or 6000l. if the actions are of 1000l. as we have just supposed.

A proprietor cannot have a deliberative vote in the assemblies of a company, unless he has a certain number of *actions*, fixed by the letters patents of its establishment; nor can he be a director, unless he has still a greater number of *actions*.

ACTION signifies also the bonds, contracts, and acknowledgments, or stock in general, which the directors of trading companies transfer, or deliver, to those who have paid their money into the company's cash, and made themselves proprietors. Thus, to deliver an *action*, is to expedite in due form the title by which the actionary becomes a proprietor of the *action* he has taken out.

The *actions* of trading companies rise or fall, according as such companies gain or lose credit. A very small matter often occasions this rising or falling of the *actions*, and frequently one uncertain rumour of a rupture between neighbouring powers, or the hope of an approaching peace, when they are at war, is sufficient to lower, or raise the price considerably, at which they are usually negotiated. It was seen in France, in the year 1719, how far the credit of a company is capable to carry that of its *actions*: those of the company of the West-Indies, known since by the name of the India company, having rose, in less than six months time, to 1,900 per cent. which had never happened to any other company, however high were its power or credit.

Before the war which France declared against the states-general of the United Provinces, in 1672, the *actions* of the Dutch East-India company had rose to 650 per cent. which is the utmost height to which they were ever known to arrive. But, in the first months of that war, which was like to have proved so fatal to that republic, the *actions* fell to less than 250. The company having afterwards retrieved themselves, their *actions* rose again, after the peace of Nimeguen, in 1678. The different ruptures that have happened since, between France and Holland, till the treaty of Utrecht in 1713, either on the account of the league of Augsburgh, or the succession of Spain, did indeed occasion some fall in the *actions*, but always inconsiderable in comparison to that of 1672; and they easily resumed their price at the end of each war, and even rose higher than they had been before: so that in the year 1718, they were not much below 600 per cent. the *actionists*, as they are called in Holland, thereby seeing their capital increased to six times its original value, and each *action*, which, at the establishment of the company, cost only 500 livres de gros, or 3000 florins, being then worth 18000 florins.

The trade of *actions*, or stocks, is one of the most considerable that is carried on upon the exchange at Amsterdam, and in all the other cities of the United Provinces, where there are chambers, or courts, of the East-India company; and there are even great numbers of people who subsist and enrich themselves by this traffic only. What renders this trade so common, and often so profitable, in Holland, is, because it can be carried on without any great fund of ready money, and consists only, if we may use the expression, in a continual vicissitude of buying and selling of *actions*, which they buy when they fall, and sell out again when they rise.

In the buying or selling of *actions* of the Dutch East-India company, a broker is almost always employed; and, when the price is agreed upon, the seller transfers them, and signs the acquittance, or receipt, in the presence of one of the directors, who causes them to be booked by the secretary, or register, which is sufficient for transferring the property of the stock sold, from the seller to the buyer. The broker's fee for his trouble is usually at the rate of six florins for each *action* of 3000 florins, one half paid by the buyer, and the other by the seller.

It is not so easy to speak of the trade in the *actions* of the French, as of that in the *actions* of the Dutch companies, every thing in the latter being transacted with the utmost regularity, and exact form; and all things in the former being at first conducted with a kind of frenzy, which

which seemed to have seized all persons, whom the prudence of the directors could not moderate for a great while; and which had, in a manner, cleared all the shops at Paris of their traders, to make as many brokers or stock-jobbers of them, and had robbed the neighbouring states of their inhabitants, who came to share the immense fortunes of the street called *Quinquempoix*, where the caprice of the people had in a manner fixed the center of that rich traffic, as Change-alley, near the Royal Exchange, was at London, in 1720.

The method of transferring *actions*, or stocks, at Amsterdam is thus: when two persons have agreed between themselves, or by the assistance of a broker, upon the price of one or more *actions*, and they are to be delivered, the seller goes to the East-India house, to make his declaration to the book-keeper, who immediately enters it, and, after having made the seller sign it, causes it also to be subscribed by one of the directors, before whom the seller must likewise declare, by word of mouth, that he has sold it. The transfer being thus registered, and the seller having informed the buyer of it, the latter has a right to go and assure himself further of it at the East-India house, in case he does not think fit to trust the person with whom he has negotiated: after which, he ought to cause the value of his *actions* transferred to be passed over at the bank to the seller's account, who, when he is certain that the value has been placed to his account, or credit, at the bank, returns to the East-India house, and signs the acquittance, or receipt, at the bottom of the transfer, which he has made. As long as this acquittance is not signed, the purchaser cannot dispose of the *actions* transferred, though he has paid for them: but, in case of the seller's refusal to sign such acquittance, after receiving the full value, he may be compelled to do so, only by a petition to the echevins, or aldermen. Each transfer costs three florins and ten stivers, both, for the seal, and to the book-keeper.

It must be observed, that the registers of transfers consist of printed forms, in which the clerks have only to fill up the blanks. These forms are called seals, because they have an impress upon them, not unlike the stamped paper of France. This regulation for the transfer of actions was established by several placarts, or decrees, of the states-general of the United Provinces; and, among others, by those of July 15, 1621, May 30, 1624, and September 16, 1677. By the same decrees, all persons, of what quality soever, are prohibited to sell, either for a fixed term, or for the present, any *actions* of the company, either for their own account, or the account of others, unless the said actions be really and actually entered in their name, or in the name of those for whom they sell, at the time of such sale, upon penalty of the seller's paying a fine of one fourth part of the price for which they shall have sold them: ordering further, that the transfer of them shall be registered within the space of fourteen days after the sale, if they were sold in a city where an office, or chamber of the East-India company is kept, or within a month, if it be in another city, under the same penalty of being fined a fourth, nor shall the contracting parties have power to except against those placarts or decrees, nor the brokers for them; upon pain of the latter being immediately deprived of their office, and the former, not brokers, punished arbitrarily, as the case shall require.

The French *ACTIONS* are, at present, of three sorts; namely, *simple actions*, *actions rentieres*, or rent actions, and *actions intéressées*, or actions bearing interest.

The *simple actions* are those which have a share in all the company's profits and losses, having no other security than the company's fund only.

The *actions rentieres*, or rent actions, are those which have a profit certain of two per cent. for which the king made himself security, as he was formerly for the annuities upon the city; but they have no share in the dividends.

The *actions intéressées*, or bearing interest, are, as it were, a medium between the two former; they have two per cent. fixed revenue, with the king's security, like the rent actions; and must, besides, share the overplus of the dividends, with the simple actions. These actions were established in behalf of such ecclesiastical

communities, as might have money to put out to use.

Besides this distinction of *actions*, authorized by the king's edicts and declarations, the caprice of the stock-jobbers of the street *Quinquempoix* had invented many others; as *actions* of the old welt, *actions* of the five hundred, of mothers, of daughters, and some others equally ridiculous. But, all these terms came to nothing at the same time, with the credit of that street.

To *feed an ACTION*, is to pay exactly, when they become due, the several sums subscribed to the stock of the company, according to the orders of council, made for the creation of new *actions*; to sell or dispose of them, according to the occasion, for cash, either to feed other actions, or for other affairs.

An *ACTION fed*, is one upon which all the payments have been made, and which is capable of sharing in the dividends of the company's profits. Till this complete and entire payment is made, it is not properly an *action*, but a subscription.

Dividend is what is otherwise called *repartition*, that is, the part, or share, which each proprietor of *actions* is to have out of the profits of a company, in proportion to the number of *actions* he has in it.

Observations on the commerce of actions in foreign countries, from the year 1719 to 1721.

What we shall add here relates only to the *actions*, or stocks, of some foreign companies, which have been carried to as great an excess as those of France, and have met with the same success; the insatiation and avidity of suddenly growing rich having been in a manner equal amongst almost all the nations of Europe, whereby an ill use was made of one of the best and most advantageous establishments that ever was, for the encrease of trade and its flourishing condition in a country.

The example of what passed in France, in the trade of *actions*, and the immense fortunes which some persons made there, tempted both the English and the Dutch at the same time; so that an infinite number of new companies were soon seen to deluge, in a manner, England and Holland. Amsterdam, Leyden, and Haerlem were almost the only cities in the United Provinces which were not carried away by the torrent; and so prodigious a number of those chimerical establishments were seen in London, that the whole trade of that great metropolis was almost reduced to the sole negotiation of stocks; which, by their fall, ruined the fortunes of many considerable merchants, and several of the most illustrious families of Great-Britain.

The companies whose stocks, or actions, made the greatest noise at London, were, among the old ones, the South-Sea, the East-India, and the Bank.

The South-Sea stock, which in the beginning of April, 1720, was only at 120 per cent. was raised, in the month of July following, to 2020 per cent.

Bank-stock rose from 148 to 300, and East-India stock from 198 to near 500.

These times, so favourable to the old proprietors, continued scarce a few months: after several fluctuations, South-sea stock fell in November to 100, and, towards the beginning of the year 1721, it could be raised only to 150 per cent. Bank-stock to 130, and East-India-stock to 160: and they fell afterwards into such a discredit, that the parliament made it their chief business, for above a year, to discover and punish the frauds and mismanagements of the cashiers and directors of those three companies, and to restore the credit of their stocks, which could not be accomplished before the year 1723.

The London assurance company was, of all the new companies in England, that which seemed to make its first appearance, under the most favourable auspices. Its stock, on which only ten per cent. was paid at first, presently rose to 120 per cent. that is, to twelve times the capital paid in, and even to 160. This flourishing state continued but a short time. A storm, which, towards the end of October 1720, occasioned the loss of twelve Jamaica ships, gave the affairs of that infant company so terrible a shock, that its stocks fell the same month to 60; other losses having also weakened it some time after, the stocks fell to 12 or 15 per cent. In short,

towards

towards the close of the same year, this promising company scarce subsisted, but in the complaints the proprietors made of being cheated by the directors.

The *actions* of the new companies established in Holland, or augmented according to the model of those of England, soon experienced the like revolutions.

The directors of the West-India company, having obtained leave from the states-general to take in new subscriptions, at the rate of 250 per cent. soon saw them rise to 650; but, falling afterwards almost on a sudden, they came down to cent. per cent.

The *actions* of the company of assurance, established at Rotterdam, in the beginning of July 1720, on which only four stivers per 100 guilders had been advanced, that is to say, 10 guilders for every *action* of 2500 guilders, soon rose to cent. per cent. But their credit hardly continued some months, when nobody would give 18 per cent. for them.

Those of Gouda (or Ter Goude) for which but one per cent. was paid in, after having sold at the rate of 30 per cent. soon fell again to their original value.

Those of the Delft company met with the same fate, and in a shorter time. In short, as there was scarce a city in North Holland, even to the most inconsiderable, where, after the example of Rotterdam, companies of navigation and assurance had been established, so there was not one, in which the avarice of the proprietors was not punished by the fall of their *actions*, and the entire loss of the money employed in them.

From this succinct account of the extravagant rise and fall of *actions* or stocks in these several companies both at home and abroad, it may prove of singular utility to the novices in these matters, to lay before them the sentiments of those who have set their fatal consequences in the strongest light, in order to warn posterity against being led into the like calamitous schemes and projects.

The close connexion which at present subsists between the monied and trading interests of these kingdoms, makes this the more natural and necessary, our trade having then received, and indeed always must receive, the greatest injury from such enormous abuses, as happened in our stock negotiations, in that famous æra in England, called the South-sea year.

Such is the nature of public credit, that none will lend their money to the support of the state under the most pressing emergencies, unless they can have the privilege of buying and selling their property in the public funds, when their occasions require. It is certain, therefore, that the greatest delicacy and tenderness are to be observed, in laying any restraints upon these transactions, lest the public credit should be thereby irrecoverably prejudiced.

In regard to great trading companies and banks, which carry on business, and make thereby a certain and apparent profit, it can never be difficult for the chief managers of such corporations to be able to judge pretty nearly, at all times, of the value of the properties of their constituents: and whenever the value of their *actions*, by any kind of artifices or unfair practices, are made to rise and fall beyond their real worth, it seems a duty incumbent on them to set the public right upon those interesting occasions.

It has been thought by some very wise and honest men, that one way to prevent those evils, which may attend the sudden and exorbitant rise and fall of stocks, would be, if these companies were obliged, once a year, to state an account of trade, and of their real profits, and lay it before their general court; and if they were tied down from dividing more than their profits, as the Dutch East-India company are said to have done, with great honour and stability to that corporation.

The circulating specie in this kingdom is reckoned by Erasmus Philips, Esq; to be about fifteen millions, and our annual money transactions, above one hundred and twenty millions; which, according to his way of reckoning, would not make less than one hundred and fifty millions. The deficiency is supplied by paper circulation, and that of the funds. This great disproportion between paper and specie currency shews, that, without the former, the business and trade of the nation must

be, perhaps, proportionably stagnated; unless we could supply our deficiency in currency by hard money.

If by such arts as were practised in the Mississippi and South-sea times, the stocks of this nation, belonging to our public companies, should be blown up again to be nominally worth one thousand times more than they intrinsically are; although this would increase the quantity of paper circulation; yet, as it would not increase our commerce in proportion, it would only draw the money out of all the channels of trade, and reduce us to real beggary, by grasping at imaginary wealth.

To support the public credit of the nation upon a solid basis, and to prevent the spreading of these corruptions and enormities in our public companies for the future, the sentiments of those cannot be too often inculcated throughout the kingdom, who have zealously laboured to guard us against the like public distress and calamity, which the nation was plunged into in the South-sea year.

As this matter is set in a strong and affecting light in what was urged by a wise and honest man in those phrenetical times, we shall give the reader the substance of it, with some suitable variations. And as for other political hints, which are interlarded, and which are not directly pertinent to the point we intended to illustrate, the reader may pass them over as he thinks proper; since curtailing the piece would be to destroy the spirit of it.

The gentleman whose sentiments these are, having explained the true nature of public credit, which consists, as he says, in the affluence of trade, the general wealth of the nation, and the confidence of the people in the justice and integrity of their governors, proceeds thus:

"I have endeavoured to shew what, and what alone, ought to be called credit. But there hath lately risen up, in our age, a new-fangled and fantastical credulity, which hath usurped the same name, and came in with the word bite, which hath been made free of a neighbouring court; whereby the poor, innocent, industrious, and unwary people have been delivered into the ravenous and polluted jaws of vultures and tigers; and thousands, I had almost said millions, have been sacrificed, to satiate the gluttony of a few. This hath inverted the œconomy and policy of nations; made a great kingdom turn all gamesters; and men have acquired the reputation of wisdom, from their skill in picking pockets. It hath entered into the cabinets of courts; hath guided the counsels of senates; and their whole wisdom, and most of their time, hath been employed in keeping up this vile and airy traffic, as if the business of government was not to protect people in their property, but to cheat people out of it.

"This is eminently true in a neighbouring country (meaning France, where the Mississippi scheme was set on foot in 1719) and I wish I could say, that nothing like it happened amongst ourselves. Neither public nor private credit can consist in selling any thing for more than it is worth, or for any thing but what it is. It is certainly the interest of a country, that its commodities should sell at a good price, and find a ready vent; that private men should be able to trust one another; that land should find ready purchasers, good securities, money at low interest; and that mortgages should be easily transferrable. And the way to bring these good purposes to pass, is to ascertain titles; give ready remedies to the injured; to procure general plenty by prudent laws, and by giving all encouragement to honesty, industry, and trade. But it will never be effected by authorizing, or countenancing frauds; by enabling artful men to circumvent the unwary, stamping the public seal upon counterfeit wares; and by constantly coining a new sort of property, of a precarious, uncertain, and transitory value; and, by constant juggles and combinations, conspiring to make it more so; which conduct, whenever practised, must soon put an end to all public and private credit.

In what country soever these practices meet with encouragement, all fair and honest commerce will be turned into juggling. There will quickly grow a sort of cabalistical learning; and there will be a secret and a vulgar

vulgar knowledge; one to be trusted only to the *verè adepti*, and managers of public companies; and the other to be divulged to the people, who will be told nothing but what it is for the interest of their betters to communicate; and pretty advantages may be made by being in the secret. As for example; just before any public misfortune is to make its appearance, those who know it may sell out their *actions*, or stocks; and in the height of the danger buy again; and when it is over, by taking another opportunity, they may sell a second time, and, when these evils are averted, they may go to market once more; and so, *toties quoties*, 'till the greatest part of the property of a kingdom, or a public company, is got into the hands of but a few persons, who will undoubtedly govern all the rest. Nor can these mischiefs be possibly prevented, but by wholly destroying this sort of traffic, or by appointing skilful pilots to set up occasional buoys and sea-marks, according to the shifting of the winds and the tides; that is, by ascertaining and publishing the real value of public securities, as often as there is an alteration made in them by new provisions, or by wholly preventing the abuses occasioned by the mere trade of stock-jobbing.

" 'Till something of this kind is done, it is foolish to think, and worse to pretend to think, that any effectual methods can be taken to discharge and pay off the national engagements; for in whatever country it happens, that the public funds become the markets and standing revenues of those who can best cure the evil; where great and sudden estates may be more easily raised by knavery and juggling, than small ones by virtue and merit; where *plumbs*, a cant word for 100,000 l. may be got at once, and vast societies may be made the accomplices of power, in order to be indulged with separate advantages; it is not to be hoped, that effectual methods will be taken to dam and choak up such inexhaustible sources of wealth and dominion. On the contrary, it is to be feared that new projects will be yearly invented; new schemes coloured with popular pretences, to toss and tumble the public securities, and to change them into as many shapes as Proteus knew.

" One year shall metamorphose the schemes of another, and the next shall undo both. The leaders of one faction shall unravel the projects of their predecessors; shall charge their designs with corruption and rapine, and be more rapacious themselves; and all, in their turns, shall raise immense estates upon the public ruins; and the last spirits shall be always the worst.

I would gladly know what advantage ever hath, or ever can arrive to the public, by railing stocks to an imaginary value, beyond what they are really worth to an honest man, who purchases them for a regular support to himself and family, and designs not to sell them again, 'till he hath occasion for the money they will produce. It can most assuredly serve no honest purpose, and will promote a thousand knavish ones. Besides these above-mentioned, it turns most of the current coin of England out of the channels of trade, and the heads of all its merchants and traders off their proper business. It enriches those who are instrumental to bring no riches into the nation by fair and honourable traffic, and it ruins the innocent, who are unacquainted with the tricks and artifices of stocks-juggling. It hath changed honest commerce into bubbling; our traders into projectors; industry into tricking; and applause is earned, when the pillory is deserved. It hath caused all the confusion in our public finances. It hath overwhelmed the nation with debts and burthens, under which it is almost ready to sink; and it hath hindered those national debts from being paid off; for if stocks fell for more than the prices at which they are redeemable, or more can be got by mere jobbing than by discharging them, then all arts will be used to prevent a redemption.

" It is folly in any one who is the least acquainted with the affairs of nations to pretend not to see, that if we do not soon put our public debts in a method of being paid, they can never be paid: but will any do their utmost to prevent so fatal a mischief to their country, who do not intend it? If there are any such, they should undoubtedly take early care to save them-

selves out of the general wreck, which very few will be able to do, though all may intend it. Those in the secret will have the advantage; for, when selling of stocks becomes the word, no one can sell, unless he sells for little or nothing. All are waiting for a rise; and, if that happens, all or most will endeavour to sell, and then all selling is at an end. The managers and brokers will engross the books, as they did in the South-sea year, and command the first sale; and, by the time they are got out, no one will be able to get out.

" There is nothing left to be done, but for all honest men to join heads, hands, and hearts, to find all means to discharge the public burthens, and to add no more to them; to search every measure, whereby we can lessen the national expences; to avoid all occasions of engaging in new ones; and to do all in our power to encrease the public wealth by solid trade, which will afford constant employment for our people, and convert our paper-money into substantial cash."

Such a revolution of property did this abuse, in the buying and selling of stocks, occasion in England in the year 1720, that a zealous advocate for the publick interests expresses himself in the following manner, which will give us a strong idea of what may be expected on the like occasion.

" What, says he, can be more invideoous, than for a nation staggering under the weight and oppression of its debts, eaten up with usury, and exhausted with payments, to have the additional mortification to see private and worthless men riot in their calamities, and grow rich, whilst they grow poor; to see the town every day glittering with new and pompous equipages, whilst they are mortgaging and selling their estates, without having spent them; and to see blazing meteors suddenly exhaled out of their jakes, and their mud, and as in Egypt, warmed into monsters."

ACTIONARY, or ACTIONIST, a proprietor of stock in a trading company. In France the word *actionnaire* is in use, and that of *actioniste* in Holland. It is lawful for an actionary or proprietor, to sell his actions or stock, either in whole or in part, with loss or with gain.

ACUDIA, an American insect, of the bigness and form of the beetle, which is said to emit light through four luminous spots, whereof two are near its eyes, and two under its wings. It is further said, that if the face be rubbed with the moisture of those luminous spots or stars, it will appear shining with light as long as it lasts; and that this moisture gave light to the Americans in the night, before the arrival of the Spaniards.

ACUITZEHUARIRA, or ZOZOTAQUAM, or CHIPAHUARZIL, a plant of Mechoacan, a province of America. Its root is round, white inwardly, and yellow outwardly. A water is distilled from it, which the Spaniards call the *enemy of poisons*, against which it is perhaps an antidote.

ADAMICA TERRA. The bottom of the sea is besmeared with a saline, glutinous, fat, mucilaginous slime or mud, like unto jelly, and is easily perceptible at low water. This mud makes the places the waters have abandoned so slippery, that there is scarce any walking on them. It appears to be a sediment of the most slimy and oily particles of the sea-waters, which continually precipitate, in the same manner as the sediment fresh water forms insensibly on the bottom of the vessels it is kept in. It is conjectured, that besides the great number of fishes and plants that die frequently and rot in the sea, the air contributes also in some degree to the augmentation of the mud; for it is observed, that the *terra adamica* is found more abundantly in vessels only covered with a linen cloth, than in those which have been hermetically sealed. *Memoires of the French Royal Academy, year 1700, page 29.*

ADAM'S PEEK, the highest mountain of Ceylon in the island of Colombo. It is two leagues in height, and on its summit is a plain of two hundred paces diameter. *Long. 98. 25. lat. 5. 55.*

ADARME, a small Spanish weight used at Buenos-Aires and in Spanish America. It is the sixteenth part of our ounce Troy weight, which is to that of Madrid, as 100 is to 93.

ADATAIS,

ADATAIS, a clear fine muslin chiefly made at Bengal; the piece measures 13 yards, and is one yard in breadth.

ADDAD, the name given by the Arabs to the root of an herb which grows in Numidia, and in some other parts of Africa. It is exceeding bitter, and so violent a poison, that thirty or forty drops of its distilled water cause death in a short time.

ADDITION in *Arithmetic*, is that rule by which several numbers are collected and put together, that fo their sum, or aggregate, may be known.

In order to render this rule easy, two things must be carefully observed,

1. That the numbers be placed in such a manner, that the figures of the same value may stand underneath each other. That is, units must be placed under units, tens under tens, hundreds under hundreds, &c. Thus, if the number 7432, and 621 were to be added together, they must be placed in this manner,

2. When the figures are placed according to the foregoing directions, each row or column must be collected into one sum in the following manner.

Always begin your addition at the place of units, and add together all the figures which stand in that row; if their sum be less than ten, set it down below the line, directly underneath its own place; but if their sum exceed ten, you must set down only the excess, and for every ten carry one to the row of tens, adding whatever you carried, and all the figures which stand in that row together, in the same manner as those of the units were added; in like manner proceed to the place of hundreds, till the whole is finished.

Thus, for example, let it be required to add the numbers 7496 + 432 + 9812 + 714 + 91, into one sum.

These being placed according to the above method, will stand

$$\begin{array}{r} \text{Thus } \left\{ \begin{array}{r} 7496 \\ 432 \\ 9812 \\ 714 \\ 91 \end{array} \right. \\ \hline 18545, \text{ the sum required.} \end{array}$$

Then, beginning at the place of units, say, 1 and 4 is 5, and 2 is 7, and 2 is 9, and 6 is 15; set down 5 (the excess above ten) underneath its own place of units, and carry one to the next row, saying, 1 and 9 is 10, and 1 is 11, and 1 is 12, and 3 is 15, and 9 is 24; set down 4 underneath its own place of tens, and carry two to the next rank, saying, 2 and 7 is 9, and 8 is 17, and 4 is 21, and 4 is 25; set down 5 underneath, and carry 2 to the last row, saying, 2 and 9 is 11, and 7 is 18; which set down as before, and you will have the whole sum required, viz. 18545, as above.

Or let it be required to find the sum of 9974 + 64832 + 4796 + 32 + 974 + 4. These being placed as above directed, will stand as in the margin. Then beginning, as before, at the place of units, say 4 and 4 is 8, and 2 is 10, and 6 is 16, and 2 is 18, and 4 is 22; set down 2, and carry 2 to the place of tens, saying 2 and 7 is 9, and 3 is 12, and 9 is 21, and 3 is 24, and 7 is 31; set down 1, and carry 3 to the next rank, saying 3 and 9 is 12, and 7 is 19, and 8 is 27, and 9 is 36; set down 6, and carry 3 to the next row, saying 3 and 4 is 7, and 4 is 11, and 9 is 20; set down 0, and carry 2 to the last row; and say 2 and 6 is 8, which set down as before, and the work is finished. When it appears, that 80612 = 9974 + 64832 + 4796 + 32 + 974 + 4.

The demonstration of the rule of addition is very easy to be conceived, and depends intirely upon the notation in use, and the 19th axiom of Euclid's first book, viz. that the whole is equal to all its parts taken together.

That is, the numbers which are proposed to be added together, represent the several parts, and their sum or aggregate the whole.

And hence is deduced the method of proving the truth of any operation in addition, viz. by dividing, or separating, the given numbers into two or more parcels, and then adding up each parcel by itself; for if those particular sums, added into one total aggregate, prove equal, or the same, with the total sum first found, the work is right; but, if not, care must be taken to find out and correct the error.

ADDITION of numbers of different denominations, is performed in the following manner: place all the numbers of the same denomination underneath each other. Thus, if several sums of money, consisting of pounds, shillings, and pence, were to be added together, you must place pounds under pounds, shillings under shillings, and pence under pence. Understand the same of weights, measures, &c. Then,

Always begin with those figures of the lowest or least denomination, and add them together into one sum; then consider how many of the next superior denomination are contained in that sum, and so many units you must carry to the next superior denomination, to be added together with those figures which stand there; and if any thing remains over and above those units so carried, that excess must be set down underneath its own denomination: in this manner you must proceed from one denomination to another, until the whole be finished.

Thus, for example, let it be required to add 27l. 18s. 4d. 96l. 14s. 6d. 7l. 8s. 10d. 107l. 18s. 2d. and 3l. 8s. 9d. into one sum.

These several sums, being placed as above directed, will stand as in the margin. Then begin with the pence, being here 10 together, the sum will be 31d. or 2s. and 7d. set down the 7d. underneath its own denomination, and carry 2 to the place of shillings, adding them and all the shillings together, and their sum will be 68s. or 3l. 8s. set down the 8s. carrying the 3l. to the first rank of pounds, and finish the work in all respects as before, in addition of whole numbers.

ADDITION of vulgar fractions. See FRACTIONS vulgar.

ADDITION of decimals is performed in all respects like addition of whole numbers, care being taken to place every figure underneath those of the same value, whether they be mixed numbers, or pure decimals; and in order to this, a due regard must be had to the commas, or separating points, which must always be placed in a direct line under each other.

Thus, for example, let it be required to find the sum of the following numbers, viz. 27,4 + 86,01 + 2,004 + 29,6 + 40,3. These being placed according to the foregoing directions, will stand in the following order:

$$\begin{array}{r} 27,4 \\ 86,01 \\ 2,004 \\ 29,6 \\ 40,3 \\ \hline \text{The sum required } 185,314 \end{array}$$

ADDRESS, is said most commonly in commerce, especially amongst the French, of what is written and affixed on bales of merchandize, casks, and other package, which are sent off to distant parts by waggons and other carriages. Those *addressees* ought to contain nearly the same particulars as the superscriptions of letters, or other circumstances peculiar to them may be added.

Addres is also a term which has several other significations among the French in commerce. It is said: *My addres is at Lyons to the house of —*, meaning that it is there I would have such goods sent me. *I accepted a bill of exchange payable to the addres of Mr. Nicholas*; which points out the place for the payment of that bill, or directs the inquiry the bearer may be obliged to make, in case of its not being accepted or paid. *This bill of exchange is to the addres of the Sieur Simon*, signifying that it is drawn upon him.

ADEN, in *Arabia*, formerly enjoyed all the advantages in trade, that *Mocha* now does, by a transfer from the other; and is the only port the grand seignior has upon the ocean; its situation near the mouth of the Red Sea renders it a harbour common to both, which still attracts a considerable trade from the Arabs, Persians, and Indians, as it some time ago did from the Dutch, till their own plantations of coffee proved almost sufficient to supply their demands, and consequently slackened their intercourse with other nations for it.

ADENOS, otherwise called *marine cotton*. It comes from Aleppo, by the way of Marfeilles.

ADEPTS, a name given to those who busied themselves in the art of transforming metals into gold, and the search of an universal remedy. One must, according to Paracelsus, expect the discovery of both immediately from heaven; it cannot, he says, pass from one man to another: but Paracelsus indulged perhaps too much some enthusiastic raptures when he thus made the eulogium of this order of philosophy, which he was extremely fond of; for, in his lucid intervals, he allowed that it might be learned from those that possessed it.

ADIT of a mine, a burrow or aperture cut in the side of the hill, in order to convey the ores, &c. from the mine, without the trouble of erasing them up to the mouth of the pit. *Adits* are generally cut twice as high as wide, that the workmen may commodiously pass along with their barrows and burdens.

ADJUSTMENT, of a loss made and promised, on a policy by an insurer, obliges him. An action was brought by Hog against Gouldney, sitting after Trinity term, 1745, at Guildhall, on a policy of insurance, which the latter wrote so long ago as in November, 1743, on the ship George and Henry, captain Bower, at and from Jamaica to London, *Interest or no interest, free of average, and without benefit of salvage to the insurers*, with a warranty annexed to the policy, viz. *Warranted the said ship to sail from Jamaica, with the fleet that came out under convoy of the Ludlow-castle man of war.*

The said ship did sail accordingly with the fleet, under the aforesaid convoy: but in a great storm that happened some time after their sailing, wherein many ships were lost, the George and Henry received so much damage, as obliged her to bear away for Charles Town in South Carolina, where she put in, and upon examination, was found quite unfit to put to sea again; whereupon her cargo was taken out, and loaded aboard other ships for London, and she condemned and broke up.

In consequence of which, the plaintiff demanded his insurance, and all the under-writers being satisfied of the truth of the afore-mentioned facts, paid their loss, except the defendant, who went so far as to settle it, and according to custom, under-wrote the policy, in the following words and figures. *Adjusted the loss on this policy, at ninety-eight pounds per cent. which I do agree to pay one month after date*, London, 5 July, 1745.

Henry Gouldney.

When this note became due, he thought himself no way bound by it, but insisted on fuller proof; particularly of the ship's sailing under convoy, as warranted, and of her condemnation at Carolina; but it having been always the custom, that after such adjustments as above, with promise of payment at a certain day, are made between the insured and insurer, no farther evidence is ever required, but the loss constantly paid; and it was upon that account that, *the jury found a verdict for the plaintiff*; and the lord chief justice, considering it as a note of hand, declared that the plaintiff had no occasion to enter into the proof of the loss.

ADMEASUREMENT. By 6 Geo. I. c. 21. sect. 33. the tonnage of ships inwards is to be measured and ascertained by the following rule, viz. Take the length of the keel within board (so much as she treads on the ground) and the breadth within board by the midship beam, from plank to plank, and half the breadth for the depth; then multiply the length by the breadth, and that product by the depth, and divide the whole by 94, the quotient will give the true contents of the tonnage.

ADMINISTRATION. The Spaniards in Peru so call the staple magazine, or warehouse, established at Callao, a small town on the South-sea, which is the port of Lima, the capital of that part of South America, and particularly of Peru. The foreign ships which obtain leave to trade along that coast, are obliged to unload at the *administration*, or staple magazine of all the European merchandizes they carry thither, paying thirteen per cent. of the price they sell for, if the cargo be intire, and even sixteen per cent. if it be not. Besides which, they pay three per 1000 duty for consulsip, and some other small royal rights and claims.

ADMIRAL, a great officer, who has the command of the navy, and the hearing of all maritime causes. The term is also used for the commander in chief of a single fleet or squadron. It is also applied to all flag officers in general.

Vice ADMIRAL, is the commander of the second squadron in the royal navy, and carries his flag at the fore-topmast-head. A *vice admiral* is also an officer appointed by the lord high admiral, in divers parts of the kingdom, with judges and marshals under him, for exercising jurisdiction within his respective limits; there are upwards of twenty *vice admirals* in Great Britain. Their decree is not final, there lying an appeal to the court of admiralty in London.

Rear ADMIRAL, is the commander of the third squadron, and carries his flag at the mizzen-topmast-head.

ADMIRALTY. As the kingdom of Great Britain is on all sides surrounded by the sea, there will ever be a necessity of maritime forces to protect and defend it; our wooden walls are our bulwarks and redoubts, to which we owe our safety, and the protection of that advantageous commerce we carry on.

And for transacting marine affairs, the lord high admiral hath courts of his own, of which that at London is principal and chief, where all process and proceedings run in his name, and not in the king's, as they do in all courts of common law. The first title of admiral of England, expressly conferred upon a subject, was given by patent of king Richard II. to the earl of Arundel and Surry; and it appears, that anciently he had jurisdiction of all causes of merchants and mariners, happening not only upon the main sea, but in all foreign parts, within the king's dominions, and without, and was to judge them in a summary way, according to the laws of Oleron, and others. 4 *Inst.* 75.

In the reign of Edward III. the court of admiralty was established; and Richard II. limited its jurisdiction. Of late times this high office has been generally executed by commissioners, who by statute are empowered to use and execute the like authorities, as lord admiral. 2 *IV.* and *M. c.* 2.

The admiralty hath cognizance of the death, or maiming a man, committed in any ship riding in great rivers, beneath the bridges thereof near the sea. 15 *Ric.* II. c. 3. sect. 2.

But if a man be killed on any arm of the sea, where the land is seen on both sides, the coroner is by common law to enquire of it, and not the admiral, for the county may take cognizance of it; and where a county may enquire, the lord high admiral has no jurisdiction. 3 *Rep.* 107.

All ports and havens are *infra corpus comitatus*, where the admiral hath no jurisdiction, and between high and low water mark, he and the common law have it by turns, one upon the water, and the other upon the land. 3 *Inst.* 113.

The admiral hath power to arrest ships for the service of the king or commonwealth; and every commander, officer, or soldier of ships of war, shall observe the admirals commands, &c. on pain of death, or other punishment. 13 *Car.* 2. c. 9.

The lord admiral has power to grant commissions to inferior admirals, &c. to call court martials for the trial of offences against the articles of war; and these courts determine by plurality of voices, &c. 13 *Car.* II. c. 9.

An admiralty process is made out in the admiral's name, who has under him a judge, commonly some learned civilian, and though the proceedings are according

ing to the civil law, and the maritime laws of *Rhodes* and *Oleron* (the sea being without the common law) yet by stat. 28 Hen. VIII. murder, robbery, &c. at sea, may be tried by special commission to the lord admiral, &c. according to the laws of England. See 11 and 12 W. III. c. 7.

The *admiralty* is said to be no court of record, on account of its proceeding by the civil law. 4 *Inft.* 133.

But the *admiralty* has jurisdiction when the common law can give no remedy; and all maritime causes, or causes arising wholly upon the sea, it hath cognizance of. 6 *Rep.*

The *admiralty* hath jurisdiction in cases of *freight*, *mariners wages*, breach of *charter parties*, though made within the realm; if the penalty be not demanded; and likewise in case of building, mending, saving, and victualling ships, &c. so as the suit be against the ship, and not only against the parties. 2 *Cro.* 216.

Mariners wages are contracted on the credit of the ship, and they may all join suits in the *admiralty*, whereas in common law they must all swear; and on the contrary, the master of a ship contracts on the owner's credit, and not the ship's, and therefore he cannot prosecute in the *admiralty* for his wages. 1 *Salk.* 33.

It is allowed by the common lawyers and civilians, that the lord admiral has cognizance of seamen's wages, and contracts, and debts for making ships; also of things done in navigable rivers, concerning damages to persons, ships, goods, annoyances of free passage, &c. of contracts, and other things done beyond sea, relating to navigation, and marine trade. *Wood Inst.* 818.

But if a contract be made beyond sea, for doing of an act, or payment of money within this kingdom, or the contract is upon the sea, and not for a marine cause, it shall be tried by jury; for where part belongs to the common law, and part to the admiral, the common shall be preferred; and contracts made beyond sea, may be tried in B. R. and a fact be laid to be done in any place in England, and so tried here. 2 *Bullst.* 322.

Where a contract is made in England, and there is a conversion beyond sea, the party may sue in the *Admiralty*, or at common law. 4 *Leon.* 257.

So where a bond is made and delivered in France: an obligation made at sea, it has been held, cannot be sued in the admiral's court, because it takes its course, and binds according to the common law. *Hob.* 11.

The court of *admiralty* cannot hold plea of a matter arising from a contract made upon the land, though the contract was concerning things belonging to the ship; but the *admiralty* may hold plea for the seamen's wages, &c. because they become due for labour done on the sea; and the contract made upon land is only to ascertain them. 3 *Leu.* 60.

Though where there is a special agreement in writing, by which seamen are to receive their wages in any other manner than usual; or if the agreement at land be under seal, so as to be more than a parole contract, it is otherwise. 1 *Salk.* 31. See *Hob.* 79.

If goods delivered on ship-board are embezzled, all the mariners ought to contribute to the satisfaction of the party who is the sufferer, by the maritime law, and the cause is to be tried in the *admiralty*. 1 *Litt.* 368.

By the custom of the *admiralty*, goods may be attached in the hands of a third person, *in causa maritima & civili*, and they shall be delivered to the plaintiff after defaults, on caution to restore them, if the debt, &c. be disproved in a year and a day; and if the party refuse to deliver them, he may be imprisoned *quousque*, &c. *March Rep.* 204.

The court of *admiralty* may cause a party to enter into bond, in nature of *caution* or *stipulation*, like bail at common law; and if he render his body, the sureties are discharged; and execution shall be of the goods or the body, &c. not of the lands. *Gadh.* 260. 1 *Steph. Abr.* 129. See 1 *Salk.* 33.

Some sailors cloaths were bought in the parish of St. Catherine, near the Tower, London, and were delivered in the ship; on a suit in the *admiralty* for the money, prohibition was granted; for this was within the county: the fame of a ship at Blackwall, &c. *Owen* 122. *Hughes Abr.* 113.

But the *admiralty* may proceed against a ship, and the sails, and tackle, when they are on shore, although alledged to be detained on land; yet upon alledging offer of a plea, claiming property therein, and refusal of the plea, on this suggestion a prohibition shall be had. 1 *Shoiv.* 179.

The *admiralty*-court may award execution upon land, though not hold plea on any thing arising on land. 4 *Inft.* 141.

And upon letters missive or request, the *admiralty* here may award execution, on a judgment beyond sea, where an Englishman flies, or comes over hither, by imprisonment of the party, who shall not be delivered by the common law. 1 *Roll. Abr.* 530.

When sentence is given in a foreign *admiralty*, the party may libel for execution of that sentence here; because all courts of *admiralty* in Europe are governed by the civil law. *Sid.* 418.

Sentences of any *admiralty* in another kingdom are to be credited, that ours may be credited there, and shall not be examined at law here; but the king may be petitioned, who may cause the complaint to be examined; and if he finds just cause, may send to his ambassador, where the sentence was given, to demand redress, and upon failure thereof, will grant letters of marque and reprisal. *Raym.* 473.

If one be sued in the *admiralty*, contrary to the statute 13 and 15 R. II. he may have a superedeas, to cause the judge to stay the proceedings, and also have action against the party suing. 10 *Rep.* 75.

A ship being privately arrested by *admiralty* process only, and no suit, it was adjudged a prosecution within the meaning of the statutes, and double damages, &c. shall be recovered. 1 *Salk.* 31, 32.

And if an erroneous judgment is given in the *admiralty*, appeal may be had to delegates appointed by commission out of Chancery, whose sentence shall be final.

The lord high admiral of Great Britain doth, by virtue of his place, appoint in divers parts of the kingdom, his several substitutes, or vice-admirals, with their judges and marshals, by patent under the great seal of the high court of *admiralty*, which vice-admirals and judges do exercise jurisdiction in maritime affairs, within their several limits; and in case any person be aggrieved by any sentence or interlocutory decree that has the force of a definitive sentence, he may appeal to the high court of *admiralty*. Stat. 8 *Eliz.* c. 5.

Besides the above-mentioned vice-admirals, &c. the lord high admiral hath under him many officers differing in degrees and qualities, as some are of a military, and others of a civil capacity, some judicial and others ministerial; so that the marine jurisdiction may justly be deemed a separate commonwealth or kingdom, and the lord high admiral be reputed as a viceroy of it.

There is under this court, a court of *equity* for determining differences between merchants; and in criminal affairs, which is commonly about piracy, the proceeding in this court was formerly by accusation and information, according to the civil law, by a man's own confession, or eye-witnesses, by which any one was to be proved guilty before he could be condemned; but that being found inconvenient, there were two statutes made by Henry VIII. that criminal affairs should be tried by witnesses and a jury; and this by a special commission of the king to the lord admiral, wherein some of the judges of the realm are even commissioners, and the trial, according to the laws of England, directed according to those statutes.

There seems to be a *divisum imperium* between the common law of England and the *admiralty*, for so far as low-water mark is observed in the sea, is counted *Infra Corpus Comitatus adjacentis*, and the causes thence arising are determinable by the common law; yet when the sea is full, the admiral hath jurisdiction here also (so long as the sea flows) over matters done between the low-water mark and the land, as appears in Sir Henry Constable's case. 5 *Rep. Coke*, p. 107.

The management of the navy royal under the lord high admiral is committed to the care of the principal officers and commissioners of it; and as all the laws for regulating and ordering his majesty's navies and forces by

by sea, were in the 22 Geo. II. collected and formed into one body, the reader for his information has here an abstract of so excellent a *code*.

The preamble sets forth, that the several sea laws having been found not to be so full, clear, expedient, or consistent with each other, as they ought to be, therefore to amend and explain the same, and to reduce them into one uniform act, *It is enacted*, that from and after the 25th of December, 1749, the articles and orders following, as well in time of peace as in war, shall be observed and put in execution in manner herein after mentioned. 22 Geo. II. p. 689.

1. All commanders, captains, &c. of his majesty's ships of war, shall cause the public worship of Almighty God, according to the liturgy of the church of England, to be reverently performed in their respective ships, and shall take care that prayers and preaching be performed diligently; and that the lord's day be observed, according to law.

2. All flag-officers, and persons belonging to his majesty's ships of war, being guilty of prophane oaths, cursings, execrations, drunkenness, uncleanness, or other scandalous actions, in derogation of God's honour, and corruption of good manners, shall incur such punishment as a court-martial shall think fit to impose, &c.

3. If any officer, or other person of the fleet, shall give, or entertain, intelligence, to, or with any enemy, or rebel, without leave from the king or lord high admiral, &c. and be thereof convicted by a court-martial, he shall be punished with death.

4. If any letter or message from any enemy or rebel, be conveyed to any officer, or any other person in the fleet, and such person shall not, within twelve hours (having opportunity) acquaint his superior officer with it; or if any superior officer, being acquainted therewith, shall not in convenient time reveal the same to the commander in chief, every person so offending shall suffer death, &c. p. 690.

5. All spies, who shall bring or deliver, any seducing letters or messages, from any enemy or rebel; or endeavour to corrupt any person in the fleet, they shall suffer death.

6. No person in the fleet shall relieve an enemy or rebel, with money, victuals, powder, shot, arms, ammunition, or any other supplies, directly, or indirectly, upon pain of death, &c.

7. All writings whatsoever, that shall be taken, or found on board ships which shall be taken as prize, shall be preserved, and the originals shall, by the commanding officer of the ship which shall take such prize, be sent entirely and without fraud to the court of Admiralty, or such other court, or commissioners, as shall be authorized to determine whether such prize be lawful capture, there to be viewed, made use of, and proceeded upon, according to law, upon pain of forfeiting his share of the capture, &c.

8. No person in, or belonging to the fleet, shall take out of any prize, any money, plate, or goods, unless it shall be necessary for the better securing thereof, or for the necessary use or service of any of his majesty's ships of war, before the same be adjudged lawful prize; but the entire account of the whole, without embezzlement, shall be brought in, and judgment passed upon the whole, without fraud, upon pain that every person offending shall forfeit his share of the capture, &c.

9. If any vessel shall be taken as prize, none of the officers or persons on board her, shall be stripped of their clothes, or pillaged, beaten, or evil-intreated, upon pain, that the offender shall be punished as a court-martial shall sentence.

10. Every flag-officer, captain, and commander in the fleet, who upon signal or order of fight, or sight of any ship or ships, which it may be his duty to engage, or who upon likelihood of engagement, shall not make the necessary preparations for fight, and shall not in his own person, and according to his place, encourage the inferior officers and men to fight courageously, shall suffer death, or other punishments, &c. and if any person in the fleet shall treacherously or cowardly yield, or cry for quarter, on being convicted, shall suffer death.

11. Every person in the fleet, who shall not duly ob-

serve the orders of the admiral, flag-officer, commander of any squadron or division, or other his superior officer, for assailing, joining battle with, or making defence against any fleet, squadron, or ship, or shall not obey the orders of his superior officer, in time of action, to the best of his power, or shall not use all possible endeavours to put the same effectually in execution, being convicted thereof, shall suffer death, &c.

12. Every person in the fleet, who through cowardice, negligence, or disaffection, shall, in time of action, withdraw or keep back, or not come into the engagement, or shall not do his utmost to take or destroy every ship which it shall be his duty to engage, and to assist and relieve all and every of his majesty's ships, or those of his allies, which it shall be his duty to assist and relieve, being convicted thereof, shall suffer death.

13. Every person in the fleet, who through cowardice, negligence, or disaffection, shall forbear to pursue the chase of any enemy, pirate, or rebel, beaten or flying; or shall not relieve and assist a known friend in view, to the utmost of his power, being convicted, shall suffer death.

14. If any action, or any service shall be commanded, and any person in the fleet shall presume to delay or discourage the same, upon pretence of arrears of wages, or any pretence whatsoever, and shall be convicted thereof, he shall suffer death.

15. Every person in, or belonging to the fleet, who shall desert to the enemy, pirate, or rebel, or run away with any of his majesty's ships, or any ordnance, ammunition, stores, or provision belonging thereto, to the weakening of the service, or yield up the same cowardly or treacherously, being convicted, shall suffer death.

16. Every person in, or belonging to the fleet, who shall desert, or entice others so to do, shall suffer death, or such other punishment, as the circumstances of the offence shall deserve, and a court-martial shall think fit; and if any commanding officer of any of his majesty's ships of war, shall receive or entertain a deserter from any other of his majesty's ships, after discovering him to be such, and shall not with all convenient speed give notice to the captain of the ship, to which such deserter belongs, or if the said ships are at any considerable distance from each other, to the secretary of the Admiralty, or to the commander in chief, every person so offending, and being convicted, &c. shall be cashiered.

17. The officers and seamen of all ships appointed for convoy of merchant ships, or of any other, shall diligently attend upon that charge without delay, according to their instructions; and whosoever shall be faulty therein, and shall not perform their duty, and defend the ships and goods in their convoy, without either diverting to other ports, or occasions, or refusing, or neglecting to fight in their defence, if they be assailed, or running away cowardly, and submitting the convoy to peril or hazard, or shall demand or exact any money or other reward from any merchant or master, for convoying of any vessels entrusted to their care, or shall misuse the master or mariners thereof, shall be condemned to make reparation of the damage to the merchants, owners, or others, as the court of Admiralty shall adjudge, and also be punished according to the quality of their offences, by death, or other punishment, according as shall be adjudged by the court-martial.

18. If any captain, or other officer of any of his majesty's ships, shall receive on board, or permit to be received on board such ship, any goods or merchandizes, other than for the sole use of the ship, except gold, silver, or jewels, and except the goods and merchandizes belonging to any vessel which may be shipwrecked, or in imminent danger of being shipwrecked, either on the high seas, or in any port, creek, or harbour, in order to the preserving them for their proper owners, and except such goods or merchandizes as he shall be ordered to be received on board by order of the lord high admiral of Great-Britain, or the commissioners for executing the said office, and be convicted thereof, &c. he shall be cashiered, and be for ever afterwards rendered incapable to serve in any place or office in the naval service of his majesty, &c. p. 694.

19. If any person in, or belonging to the fleet, shall make, or endeavour to make any mutinous assembly, upon any pretence whatsoever, and be convicted thereof, &c. he shall suffer death: and if any person shall utter any words of sedition or mutiny, he shall suffer death, or such other punishment as a court-martial shall deem him to deserve: and if any officer, mariner, or soldier, shall behave himself with contempt to his superior officer, such superior officer being in the execution of his office, he shall be punished according to the nature of his offence, by the judgment of a court-martial.

20. If any person in the fleet shall conceal any traitorous, or mutinous practice or design, being convicted thereof, &c. he shall suffer death; and if any person shall conceal any traitorous or mutinous words, spoken by any, to the prejudice of his majesty or government, or any words, practices, or designs, tending to the hindrance of the service, and shall not forthwith reveal the same to the commanding officer, or being present at any mutiny or sedition, shall not use his utmost endeavours to suppress the same, he shall be punished as a court-martial thinks he deserves.

21. If any person in the fleet shall find cause of complaint, of the unwholeness of the victuals, or other just ground, he shall quietly make the same known to his superior, or captain, or commander in chief, as the occasion may deserve, that such present remedy may be had as the matter may require; and the said superior, &c. shall, as far as he is able, cause the same to be presently remedied; and no person upon such, or any other pretence, shall attempt to stir up any disturbance, upon pain of such punishment as a court-martial shall think fit to inflict, &c. p. 695.

22. If any officer, or other person in the fleet, shall strike any of his superior officers, or draw, or offer to draw, or lift up any weapon against him, being in the execution of his office, on any pretence whatsoever, and be convicted thereof, &c. he shall suffer death; and if any person shall presume to quarrel with any of his superior officers, being in the execution of his office, or shall disobey any lawful command of any of his superior officers, and be convicted thereof, &c. he shall suffer death, &c.

23. If any person in the fleet shall quarrel, or fight with any other person in the fleet, or use reproachful or provoking speeches, or gestures, tending to make any quarrel or disturbance, he shall upon being convicted, suffer such punishment as the offence shall deserve, and a court-martial shall impose.

24. There shall be no wasteful expence of any powder, shot, ammunition, or other stores in the fleet, nor any embezzlement thereof; but the stores and provisions shall be carefully preserved, upon pain of such punishment to the offenders, abettors, buyers, and receivers (being persons subject to naval discipline) as shall be by a court-martial found just.

25. Every person in the fleet, who shall unlawfully burn, or set fire to any magazine, or store of powder, or ship, boat, ketch, hoy, or vessel, or tackle, or furniture thereunto belonging, not then appertaining to an enemy, pirate, or rebel, being convicted of any such offence, by the sentence of a court-martial, shall suffer death.

26. Care shall be taken in conducting and steering of any of his majesty's ships, that through wilfulness, negligence, or other defaults, no ship be stranded, or run upon any rocks, or sands, or split, or hazarded, upon pain, that such as shall be found guilty therein, be punished by death, &c. p. 696.

27. No person in, or belonging to the fleet, shall sleep upon his watch, negligently perform the duty imposed on him, or forsake his station, upon pain of death, &c.

28. All murders committed by any person in the fleet, shall be punished with death, &c.

29. If any person in the fleet shall commit the unnatural and detestable sin of buggery or sodomy, with man or beast, he shall be punished with death, &c.

30. All robbery committed by any person in the fleet, shall be punished with death, &c.

31. Every officer, or other person in the fleet, who shall knowingly make, or sign a false muster, or false muster-

book, or who shall command, counsel, or procure the making or signing thereof, shall, upon proof of any such offence, &c. be cashiered, and rendered incapable of farther employment in his majesty's naval service.

32. No provost-martial belonging to the fleet shall refuse to apprehend any criminal, whom he shall be authorized, by legal warrant, to apprehend, or to receive, or keep any prisoner committed to his charge, or willfully suffer him to escape, being once in his custody, or dismiss him without lawful order, upon pain of such punishment as a court-martial shall deem him to deserve; and all officers, and others in the fleet, shall do their endeavour to detect, apprehend, and bring to punishment all offenders, and shall assist the officers appointed for that purpose therein, upon pain of being proceeded against, and punished by a court-martial, &c. p. 697.

33. If any flag-officer, captain, or commander, or lieutenant belonging to the fleet, shall be convicted before a court-martial, of behaving in a scandalous, infamous, cruel, oppressive, or fraudulent manner, unbecoming the character of an officer, he shall be dismissed from his majesty's service.

34. Every person being in actual service, and full pay, and part of the crew belonging to any of his majesty's ships of war, who shall be guilty of mutiny, desertion, or disobedience, to any lawful command, in any part of his majesty's dominions on shore, when in actual service relative to the fleet, shall be liable to be tried by a court-martial, and suffer the like punishment for every such offence, as if the same had been committed at sea.

35. If any person who shall be in actual service, and full pay in his majesty's ships of war, shall commit upon the shore, in any place out of his majesty's dominions, any of the crimes punishable by these articles and orders, he shall be liable to be tried and punished for the same, in like manner, as if the said crimes had been committed at sea.

36. All other crimes, not capital, committed by any person in the fleet, which are not mentioned in this act, or for which no punishment is hereby directed to be inflicted, shall be punished according to the laws and customs in such cases used at sea.

No person convicted of any offence shall, by the sentence of any court-martial be adjudged to be imprisoned for a longer term than two years. P. 698.

No court-martial shall proceed to the punishment, or trial of any offence (except the officers specified in the 5th, 34th, and 35th of the foregoing articles and orders) which shall not be committed upon the main sea, or in great rivers only, beneath the bridges of the said rivers nigh to the sea, or in any haven, river, or creek, within the jurisdiction of the admiralty, and which shall not be committed by such persons, as at the time of the offence, shall be in actual service, and full pay in the fleet, such persons only excepted, and for such offences only, as are described in the 5th of the foregoing articles and orders.

No court-martial, constituted by virtue of this act, shall proceed to the punishment or trial of any land-officer or soldier, on board any transport ship, for any offence specified in the said articles.

From and after the 25th of December, 1749, the lord high admiral of Great-Britain, or the commissioners for executing the said office, are empowered to grant commissions to the commander in chief of any fleet or squadron of ships of war, to call and assemble courts-martial, consisting of commanders and captains; and if such commander in chief shall die, be recalled, or removed from his command, then the officer upon whom the said command shall from time to time devolve, shall have the same power to call and assemble courts-martial, as the first commander in chief was invested with. P. 699.

No commander in chief of any fleet, or squadron of his majesty's ships, or detachment thereof, consisting of more than five ships, shall preside at any court-martial in foreign parts; but the officer next in command shall hold such court-martial, and preside thereat.

From and after the 25th of December, 1749, if any commander in chief in foreign parts, shall detach any part of his fleet or squadron, he shall by writing under his hand, empower the chief commander of the squadron or detach-

detachment, ordered on such separate service (and in case of his death or removal, the officer to whom the command shall belong) to hold courts-martial during the time of such separate service, or until he shall return to his commander in chief, or shall come under the command of any other his superior officer, or return to Great-Britain or Ireland.

Where any material objection occurs, which may render it improper for the person, next in command to the senior officer, or commander in chief of any fleet or squadron, in foreign parts, to hold courts-martial, or preside thereat, the lord high admiral, or the commissioners for executing the said office, as also the commander in chief of such fleet or squadron, may appoint the third officer in command to preside at, or hold such court-martial. P. 700.

From and after the 25th of December, 1749, the lord high admiral, or the commissioners for executing the said office, are empowered to direct any flag-officer, or captain of any of his majesty's ships of war, who shall be in any port of Great-Britain or Ireland, to hold courts-martial in such port (provided such officer be the first, second, or third in command, in such port) as shall be found most expedient, and for the good of the service; and such flag-officer or captain shall preside thereat.

From and after the 25th of December, 1749, no court-martial shall consist of more than thirteen, or of less than five persons, to be composed of such flag-officers, captains, or commanders, then, and there present, as are next in seniority to the officer who presides at the court-martial.

The lord high admiral, or the commissioners for executing the said office, or any officer empowered to order or hold courts-martial, shall not direct or ascertain the particular number of persons of which any court-martial shall consist.

If any court-martial shall be appointed to be held at any place, where there are not less than three, nor yet so many as five officers, of the degree of a post-captain, or of a superior rank, to be found, the officer who is to preside, shall call to his assistance as many of the commanders of his majesty's vessels under that rank, as, together with the post-captains, will make up the number of five to hold such court-martial. P. 701.

From and after the 25th of December, 1749, no member of a court-martial, after trial is begun, shall go on shore till sentence be given, but remain on board the ship in which the court shall first assemble, except in case of sickness, to be judged of by the court, upon pain of being cashiered; nor shall the proceedings of the court be delayed by the absence of any members, provided a sufficient number remain, to compose the court, which shall be from day to day (Sunday always excepted) until sentence be given.

From and after the said 25th of December, all the officers present, who are to constitute a court-martial for the trial of offenders, shall, before they proceed to trial, take an oath before the court, to be administered by the judge-advocate or his deputy, in the words following, viz.

"I A. B. do swear, that I will duly administer justice, according to the articles and orders, established by an act passed in the twenty-second year of the reign of his majesty king George the Second, for amending, explaining, and reducing into one act of parliament, the laws relating to the government of his majesty's ships, vessels, and forces by sea, without partiality, favour, or affection; and if any case shall arise, which is not particularly mentioned in the said articles and orders, I will duly administer justice according to my conscience, the best of my understanding, and the custom of the navy in the like cases; and I do further swear, that I will not upon any account, at any time whatsoever, disclose or discover the vote or opinion of any particular member of this court-martial, unless thereunto required by act of parliament.

So help me God."

And so soon as the said oath shall have been administered to the respective members, the president of the court shall administer to the judge-advocate, or the person officiating as such, an oath in the following words:

"I A. B. do swear, that I will not upon any account, at any time whatsoever, disclose, or discover the vote or opinion of any particular member of this court-martial, unless thereunto required by act of parliament.
So help me God." P. 702.

If any person in the fleet being called upon to give evidence at any court-martial, shall refuse to give evidence upon oath, or shall prevaricate, or behave with contempt to the court, such court-martial is empowered to commit the offender, for any time not exceeding three months, in case of such refusal or prevarication, nor longer than one month in case of such contempt; and every person who shall either commit, or corruptly procure, or suborn any person to commit wilful perjury, shall be prosecuted in the King's-Bench, by indictment or information; and every issue joined thereon, shall be tried by a jury of Middlesex, or such other country as the said court shall direct; and the offender upon conviction, shall suffer the pains and penalties enacted to be inflicted for the like offences by an act of 5 Eliz. and 2 Geo. II, &c.

In every such information or indictment, it shall be sufficient to set forth the offence charged upon the defendant, without setting forth the commission for holding the court-martial, or the particular matter tried or directed to be tried before such court. P. 703.

From and after the 25th of December, 1749, no sentence of death given by any court-martial held within the narrow seas (except in cases of mutiny) shall be executed till after report of the proceedings shall have been made to the lord high admiral, or the commissioners for executing the said office, and his or their directions shall have been given therein; and if the said court shall have been held beyond the narrow seas, then such sentence of death shall not be executed but by order of the commander of the fleet or squadron wherein sentence was passed; and where sentence of death shall be passed in any squadron detached from any other fleet or squadron upon a separate service, then such sentence (except in cases of mutiny) shall not be executed but by order of the commander of the fleet or squadron, from which such detachment shall have been made, or of the lord high admiral, or the commissioners for executing the said office; and where sentence of death shall be passed in any court held by the senior officer of five or more ships, which shall happen to meet in foreign parts, then such sentence (except in cases of mutiny) shall not be executed but by order of the lord high admiral, or commissioners for executing the said office.

The judge-advocate, or his deputy, is to administer an oath to witnesses at any trial by a court-martial; and in the absence of the judge-advocate and his deputy, the court shall appoint any person to execute the said office. P. 704.

From and after the 25th of December, 1749, all the powers given by the several articles and orders established by this act, shall be in force with respect to the crews of such of his majesty's ships as shall be wrecked or be otherwise lost or destroyed; and all the command and authority given to the officers, shall be in force as effectually as if such ships to which they did belong, were not so wrecked or destroyed, until they shall be discharged from his majesty's further service, or removed into some other ship of war, or until a court-martial be held to enquire into the causes of the loss of the said ship; and if it shall appear by the sentence of the court, that the said officers or seamen did their utmost to preserve or recover the said ship, and since the loss thereof have behaved obediently to their superior officers, according to the discipline of the navy and the articles aforesaid, then all the pay and wages of the said officers and seamen, or of such of them as shall have done their duty, shall be paid to the time of their discharge or death, or if they shall be then alive, to the time of the holding of such court-martial, or their removal into some other of his majesty's ships; and every person who, after the wreck or loss of his ship, shall act contrary to the discipline of the navy, and the articles and orders aforesaid, shall be sentenced by the said court-martial, and punished, as if the ship, to which he did belong, was not so wrecked or destroyed.

From

From and after the said 25th of December, all the pay and wages of such officers and seamen of any of his majesty's ships as are taken by the enemy, and upon enquiry at a court-martial, shall appear by the sentence of the said court to have done their utmost to defend the said ship, and since the taking thereof, to have behaved obediently to their superior officers; according to the discipline of the navy, and the articles aforesaid, shall be paid from the time of their being so taken, to the time of the holding of such court-martial, or until they shall be discharged from his majesty's service, or removed into some other ship of war, or (if they shall die in captivity, or before the holding of such court-martial) to the time of their death, in such manner as if the ship to which they did belong respectively, was not so taken. P. 705.

No person, not flying from justice, shall be tried or punished by any court-martial for any offence against this act, unless complaint of such offence be made in writing to the lord high admiral, or to the commissioners for executing the said office, or any commander in chief of his majesty's squadrons or ships, empowered to hold courts-martial; or unless a court-martial to try such offender shall be ordered by the lord high admiral, or the commissioners for executing the said office, or the said commander in chief, either within three years after such offences shall be committed, or within one year after the return of the ship or squadron, to which such offender shall belong, into any of the ports of Great Britain or Ireland, or within one year after the return of such offender into Great Britain or Ireland.

From and after the said 25th of December, if any captain or other officer of the fleet, shall receive, or suffer to be received on board, any goods or merchandizes, contrary to the true intent and meaning of the eighteenth article of this act, he shall for every such offence, over and above any punishment inflicted by this act, forfeit and pay the value of such goods and merchandizes, or the sum of 500 l. at the election of the informers, or persons who shall sue for the same, so that no more than one of these forfeitures shall be sued for and recovered against the same person for one and the same offence; one moiety to the informer, and the other to Greenwich-hospital, &c. p. 706.

This act shall not extend to take away from the lord high admiral, or the commissioners for executing the said office, or any vice-admiral, or judge of the admiralty, or his other deputies, or any officer or minister of the admiralty, or others having or claiming any admiral power or authority within this realm, or any other the king's dominions, or from any person or court whatsoever, any power, right, jurisdiction, pre-eminence, or authority, which any of them lawfully hath, or had, or ought to have and enjoy before the making of this act, so as the same person shall not be punished twice for the same offence, p. 707.

The repeal of the before recited statutes, or any thing herein contained, shall not discharge or prevent any prosecution or suit, which is, or shall be commenced against any person, for any offence committed on or before the said 25th of December, 1749, or to be committed against the said statutes; but all persons who have been, or shall before the 25th of December be, guilty of any such offence, shall and may be prosecuted, condemned, and punished for the same, as well after as before the said 25th of December, as if the said statutes had not been repealed.

Since the above act the following 31 Geo. II. was made for the encouragement of seamen to enter into his majesty's service, during the war, begun in 1756.

The preamble sets forth, that the encouragement of seamen employed in the royal navy, will greatly tend to augment the marine force of this realm; whereon, under the good providence and protection of God, the security of these kingdoms, and the support and preservation of their commerce, do most immediately depend: And that by an act 1. Geo. II. and another of the same session, several provisions and regulations were enacted and prescribed for the benefit and encouragement of seamen employed in the royal navy; and for preventing frauds and abuses in purchasing their wages; which provisions and regulations, from various difficulties in carrying the same into execution, have been

found in a great measure ineffectual to answer the purpose thereby intended. And that the establishing a regular method for the punctual, frequent, and certain payment of the wages, or pay, due to inferior officers and seamen employed in the navy; the enabling such officers and seamen more easily and readily to obtain such payments, and to allot and remit any part thereof, for the support and relief of their wives and families; and the preventing, as far as may be, the unwary, the ignorant, or the necessitous, from being defrauded and injured by the extortion and usury of wicked and evil designing persons, are of the utmost consequence to the public service. Therefore, for effectuating these important and compassionate purposes, it is enacted, that from and after November 1, 1758, every volunteer, who shall enter his name with a commission officer, appointed for entering volunteers in the royal navy, and shall receive from him a certificate thereof (which is to be given him gratis) is entitled to wages from the date thereof, including the day of the date, if he appears on board within fourteen days, if the ship is not above one hundred miles; or thirty days if above two hundred miles; and shall be allowed the usual conduct money, and also two month's wages advance, at the first fitting out the ship, and before the ships proceed to sea.

Every supernumary man serving ten days in any ship, shall be borne for and entitled to his wages upon the books of such ship, and to all other benefits, as if he was part of the complement: but men lent from one ship to another, shall continue to be borne for the ship from which they were lent, 'till discharged.

Every inferior officer or seaman, who shall be turned over from one ship to another (in case the ship into which he is turned over is then, or shall come into, a port of Great Britain, where there is a commissioner of the navy) shall be paid all the wages due to him in the ship from which he was turned over, before the ship into which he was turned over shall proceed to sea, unless directed otherwise by special order from the admiralty, in cases of the greatest exigency only; and if the ship proceed to sea, the wages shall be paid as soon as such ship shall come again into any port of Great Britain, where there is a commissioner.

Every officer or seaman, who shall be turned over, shall not be rated in a lower degree than he served in the former ship; and above his wages, shall receive two month's advance before the ship shall proceed to sea.

As often as any ship, which shall have been in sea pay twelve months, or more, shall arrive in any port of Great Britain, or on the coast thereof, the master shall cause five complete pay-books, to be made out for the time such ships shall have been in pay, except the last six months, and transmit such books, together with three alphabets, and a stop-book to the navy board; and as soon as such ship shall arrive in any port of Great Britain, where there is a commissioner, immediate payment shall be made of the wages due to the officers and seamen, their executors, &c. deducting the advance money, and all defalcation, leaving always six month's wages unpaid, and no more. And all wages due to any ships, shall be paid as soon as may be, or within two months at farthest, after the arrival of such ship in port to be laid up.

If any inferior officer or seaman, who was absent at the payment of his ship, or his captain for him, shall apply to the navy board, in case such ship shall be in any port of Great Britain, where there is a commissioner, the pay-lists shall be sent to such commissioner, who shall forthwith cause the wages to be paid to such person.

The commander shall make out a ticket upon the death of every petty officer or seaman, and shall transmit the same to the navy-board, who are to cause the day of receipt to be endorsed thereon, and shall examine and sign the same for payment within one month after the receipt thereof: and the same shall be delivered, and payment thereon made, without fee or reward, to the executors, administrators, or attorney, or the executors, &c. of such officer or seaman.

When any inferior officer or seaman shall be rendered unserviceable, the commander shall give him a certificate of his discharge, and make out a ticket for his pay (unless the ships shall be in some port of Great Britain,

or on the coast thereof, or shall belong to some squadron from which he is not separated; in which case he is to make a report to the commanders in chief, and receive his orders thereupon) and shall send the ticket to the navy-board; and deliver only to such officer or seaman the certificate of his discharge, containing an exact copy of the ticket, and a description of his person. The commissioners of the navy shall cause the day when such ticket was received, to be endorsed thereon; and, after examination, shall assign the same for payment, within one month at farthest, after making such endorsement. And if any officer or seaman shall present such certificate at the Navy-office, the commissioners are forthwith to examine such certificate, and the person presenting the same; and being satisfied therein, shall testify the same on the certificate; and the ticket shall be immediately delivered him, and paid at the Pay-office to such officer or seaman only, without fee or reward. If the tickets shall not have been transmitted to the Navy-office, the money appearing to be due by the copy, shall be paid as if the certificate had been received. Such officer or seaman, being desirous to receive his wages at any port of Great Britain, where a commissioner resides, may produce his certificate to him; and being satisfied of the truth thereof, shall sign and transmit the same to the navy-board; who within four days after receiving it, are to send the ticket if received, otherwise a copy of the certificate, to the commissioners at such port, who shall cause immediate payment thereof to be made, without fee or reward. And send such officer or seaman to the nearest hospital, where he is to be received and victualled, from the time of presenting such certificate until payment is made.

If such certificate be lost or destroyed, or not presented in person, or the money paid before the general payment of the ship's company, the ticket shall be cancelled, and the wages paid as if no ticket had been made out.

When any inferior officer or seaman shall, by order of the commander, be set ashore, and be sent to any hospital, or sick quarters, such commander shall make out a sick ticket for the wages due to such person, and transmit the same with such officer or seaman to such hospital or sick quarters; and if he shall be regularly discharged from thence as unserviceable, a certificate of his discharge, with the sick ticket annexed, shall be delivered to him; and if he shall present the same to a commissioner at any port of Great Britain, such commissioner being satisfied thereof, shall sign the same on the certificate, and transmit the certificate and sick ticket to the navy-board, who are to cause the day it was received, to be endorsed thereon, and also cause it to be examined by the muster-books, if received; and then within four days, to cause a ticket or pay-list to be made out for such person's wages, and to send the same to the commissioner; who shall cause immediate payment to be made of the wages of such seaman, without fee or reward; who, notwithstanding such discharge, shall be maintained in such hospital or sick quarters, until the payment be made.

The payment of tickets, certificates, or pay-lists, shall not be delayed, though the muster or pay-books, shall not be regularly received at the navy-board; but if any errors shall be made in any certificate, ticket, or pay-list, the loss is to be made good out of the commander's wages.

As often as any ship, which shall not be in a port of Great Britain, or on the coast thereof, shall have twelve month's wages due, the commander shall cause the inferior officers and seamen's names to be called over, and shall do the same whenever twelve month's wages shall be due; and if any of them shall deliver in writing the name and place of abode of his wife, father, or mother, and desire that the whole or any part of such wages then due, except the last six months, should be paid to his said wife, father, or mother, by the receiver general of the land-tax, collector of the customs, collector of the excise, or clerk of the cheque at any dock-yard, the commander is to send a list of such persons to the navy-board, who shall take out two bills for the payment of the wages so allotted by each person, one of

them to be sent to the persons respectively specified in such lists, and the other to the receiver, &c. And if the person, to whom any such bill is sent, shall, within six months of the date hereof, produce the same to such receiver, &c. together with a certificate, properly authenticated of their being the wife, father, or mother, of such officer or seaman respectively, such receiver, &c. upon being satisfied of the truth of such certificate (which he is to enquire into upon the oath of the person producing the same) is immediately, without fee or reward, to pay the sum mentioned in such bill, taking a receipt. Such bill, together with the duplicate thereof, being produced at the Navy-office, shall be immediately assigned for payment by the commissioners of the navy, and repaid by the treasurer to such receiver, &c. or their order: but if payment of the bill be not demanded within six months, the sum contained in such bill, is to be repaid to such inferior officer or seaman, &c.

In like manner where wages shall be paid at the Pay-office or any of the out-ports, any inferior officer or seaman, desirous to remit the whole or any part of his wages to his wife, children, parent, or any other person, may have a bill for the same, as in the last clause.

If any receiver, &c. shall not have in his hands public money sufficient to pay any bill tendered, and shall refuse payment thereof, he is to endorse on the back of the bill the cause of his delay, and appoint for payment some day within two months. And if any receiver, &c. shall unnecessarily refuse payment, or he or any person employed under him, take any gratuity for such payment, any three commissioners of the branch of business he is under, may fine such person in any sum not exceeding fifty pounds; to be levied as any offences against the laws of customs and excise, and to be paid to the informer.

The wages, &c. earned by any indentured apprentice shall be paid to his master, as hath been usual, unless such apprentice was above eighteen years of age, when his indentures were executed, or shall be rated as servant to an officer to whom such apprenticeship is not known; in which case the officer shall be entitled to the pay, according to the practice of the navy.

Commanders of ships are to transmit to the navy-board complete pay-books, and lists and tickets made out, and also once in two months muster-books, not only for the said two months, but from the time the ship shall have been in commission, or was last paid; on failure, the navy-board are not to grant him the general certificate for his wages, unless by particular order from the lords of the admiralty, in cases of necessity, and its being made appear to them, that directions were complied with as far as the nature of service would admit, and as safe opportunities offered: and if such commander shall not exculpate himself within twelve months after his arrival in Great Britain, he shall forfeit all his wages to the chest at Chatham; and be liable to such other punishment, not extending to life and limb, as a court-martial shall inflict.

No letters of attorney made by any inferior officers or seamen, or their executor, &c. shall be valid, unless declared therein revocable, and unless the same be signed before, and attested by the commander, and another of the signing officers, or by a clerk of the cheque; and if made after such person shall be discharged from the service, then to be signed before, and attested by the chief magistrate where such seaman shall reside; or if made by executors, &c. be signed before, and attested by the minister and church-wardens, or in Scotland, by the minister and two elders, of the parish where such executors, &c. reside.

All letters of attorney, other than such as are made and attested aforesaid, are null and void.

No more than 1s. shall be taken by any ecclesiastical court, &c. for the probate of any will or letter of administration granted to the widows, children, parents, brothers, or sisters, of inferior officers, seamen, or mariners, dying in the service, and for attending the same, unless the goods and chattels are of the value of 20l. nor more than 2s. unless of the value of 40l. nor more than 3s. unless of the value of 60l. nor more than 1s. for issuing commissions to swear such widows,

widows, &c. being executors or administrators to inferior officers, &c. unless the goods and chattels are of the value of 20 l. nor more than 2 s. unless of the value of 40 l. nor more than 3 s. unless of the value of 60 l. under penalty of 50 l. to be paid by the offender to the party aggrieved, to be recovered with full costs of suit in any court of record.

Whosoever shall personate or assume the name or character, or procure any other, to personate or falsely assume the name or character of any officer, seaman, or other person, intitled to wages, &c. for service done in the royal navy, or the executor, administrator, wife, relation, or creditor, of any officer, &c. in order to receive any wages, &c. or shall forge or counterfeit, or procure to be forged or counterfeited, any letter of attorney, or other power, in order to receive any wages, &c. or shall willingly or knowingly take a false oath, or procure a false oath to be taken, to obtain the probate of a will, or letters of administration, in order to receive any wages, &c. due, or supposed to be due, shall be guilty of felony, and suffer death.

When the pay-books are closed, tickets shall be made out, on application to the navy-board, to the seamen who shall not have received their wages; and such tickets shall be paid in course, once a month.

British governors, ministers, and consuls, residing at foreign parts, or any two British merchants, are required to provide for seafaring-men and boys, subjects of Great Britain, who shall be in foreign parts by shipwreck, capture, or other unavoidable accidents, or who shall be discharged as unseaworthy from the British navy, and subsidize them at sixpence *per diem* each, and send them home as soon as possible in any British ships.

The bills of their disbursements, with vouchers, are to be sent to the navy-board, who are to cause immediate payment. And every master of a ship is to take so many as the said governors, &c. shall direct, not exceeding four to every hundred tons. Such masters to be allowed sixpence *per diem*, for all such as shall exceed their complement, upon producing a certificate from the governors, &c. of the number taken on board, and making affidavit of the time they were subsidized, and that they did not want of their complement, and for what time.

No volunteer shall be liable to be taken out of his majesty's service, by any process, except some criminal matters, unless for a real debt, and unless the plaintiff, or some other person in his behalf, make affidavit that to his knowledge the sum due to the plaintiff with costs of suit amounts to 20 l. at least, a memorandum of which oath is to be marked on the back of the writ or process, for which no fee shall be taken; and if any person shall be arrested contrary to the intent of this act, any judge of such court may examine into the same on oath, and discharge such seaman without fees, on proof of his belonging to one of the king's ships, and being arrested contrary to the intent of this act, and may award reasonable costs, for recovery whereof he shall have the same remedy as the plaintiff, if he had judgment.

But plaintiffs, upon notice first given in writing to such seaman, or left at his last place of abode, may file a common appearance, so as to entitle them to proceed to judgment and outlawry, and to have an execution thereupon, except against the bodies of such seamen.

Persons employed to receive seamen's wages, prize-money, &c. shall take no more than sixpence in the pound; and if they shall take any more, to forfeit 50 l. with full costs of suit to the prosecutor: and if such person belong to any office in the navy, he shall lose his place, and be incapable of holding any place of profit in any such office.

All persons in offices belonging to the navy, taking fees contrary to this act, are liable to the same penalty.

It must be observed, besides what we have remarked in the beginning of this article, that the jurisdiction of the court of admiralty is sometimes interrupted by a writ, which

in our law is called a *prohibitio*, and may be properly defined to be, "A writ, forbidding to hold plea in any matter or cause, supposed to be without the jurisdiction and cognizance of the court where the suit depends."

But, in all cases where the admiralty have legally an original or concurrent jurisdiction, the courts of common law will be well informed, before they will take cognizance of them. We shall give some of the principal cases relating to the jurisdiction of the admiralty, as to matters cognizable there, or at common law.

If a man be in custody for piracy, if any aids or assists him in his escape, though that matter is an offence at land, yet the admiralty having jurisdiction to punish the principal, may have likewise power to punish such an offender, who is looked on as an accessory to the piracy; but, to rescue a prisoner from an officer of theirs, they may examine the cause, but they cannot proceed criminally against the offender.

If a ship rides at an anchor in the sea, and the master sends his boat on shore for victuals, or other provisions for the ship, and accordingly the shop-feller brings victuals and provisions; in that case, if the contract be made there, it must be sued for in the admiralty: but, if the goods are by the purser or mariners contracted for at land, they must sue at common law.

But a suit in the admiralty for seamen's wages, grown due in the river, though no voyage be made, was not prohibited. Lord Raymond, 1844.

Trials are to be where original contracts were made, which if in England, though the subsequent matter to be done be upon the sea, the trial shall be at common law. But if the contract and what is to be done, all of it, is beyond sea, it cannot be tried at law here, but in the admiralty; but if part be done here, and part beyond sea, so as it is mixed, then it shall be tried at law. As an action upon the case, upon a policy of assurance made at London, that a ship should sail from Melcomb Regis, in the county of Dorset, to Abbeville in France, safely, &c. And the plaintiff declared, that the ship in sailing towards Abbeville, viz. in the river Soam in France, was arrested by the king of France, &c. and the issue was, whether the ship was so arrested or not; the trial was by *nisi prius* in London, and resolved to be well brought; though it was objected, that this issue, arising merely from a place out of the realm, could not be tried at law, for the *assumpsit*, being at London, was the ground and foundation of the action, and therefore shall be tried here, for otherwise it could not be tried at all. Cited in *Dowdale's case*, 6 Rep. 47. 6 Godbolt 76, and 204.

And so if a contract be made at land, though beyond sea, the trials shall be at law, though what is to be done be all of it beyond sea, by laying the contract made at a place in England; as in *Bourdeaux apud Islington in com. Middlesex*. So is the case of *Slaney and Cloberry*, against *Cotton*, where the plaintiff sued the defendant in the Admiralty-court, upon a promise made in Barbary, to sail from Sirborona, in Barbary, to Ricumpta in Brazil, &c. upon suggestion that the contract was made in London, prohibition was granted: for the performance of the consideration does not give the action, without the contract; and this was made at land, though beyond the seas, which may be supposed to be done in a place in England. 2 Rolls. Rep. 486. See Tucker and Cuff's case in the same book, 492, and 497, and 2 Brown. 10, 11.

A contract was made at Newcastle, that a ship should sail from Yarmouth to Amsterdam; a debt was brought upon this contract in the court of Newcastle; adjudged that the action would not lie there, being a limited jurisdiction, which shall not have cognizance of any matters done in *partibus transmarinis*, but only the courts at Westminster. *March's Rep.* 3.

If one libel in the court of admiralty for a thing done upon land, and it appears upon the libel that the thing was done upon the land, and they notwithstanding that, hold plea of it, a *præmunire* lieth upon it; but, if the same do not appear within the libel, then it was not within the 3rd of Rich. II. cap. 5. and 1st of Rich. II. cap. 3. but a *prohibition* shall only issue. 2 Leon. 183.

A Dutch ship was broken by a great tempest in a creek of the sea, *infra corpus comitatus de Dorset*; the sailors, upon pretence that the goods in the ship were *bona peritura*, procured a commission of sale out of the Admiralty-court to sell them; and the true owners, to prevent such sale, brought a *superfedeas*; and, upon shewing the libel to the court, a prohibition was granted.

1. Because the cause of action accrued *infra corpus comitatus*. 2. Because the sale of the goods was good, as *bona peritura*. *Calmer against Brand*. 2 Sid. 81.

One having taken a ship as prize, which had *bona peritura*, entered into recognizance with sureties before the judge's delegate, to bring the money raised by sale of the goods in the Admiralty-court before such a day, if they, upon a plaint there depending, did not adjudge the ship and goods to be lawful prize; which they adjudged lawful prize; and after, at another time, cited the owner before the judges of the admiralty, and, for his not coming and bringing the money at the day, they threatened to sue execution against the bail or sureties, who were merchants of London; upon which prohibition was prayed; for, by their first judgment or sentence, their recognizance was discharged, and they ought not, by colour of this, to endanger the credit of men of reputation; but the court would not grant a prohibition, for they said an unjust sentence of the admiralty, in a cause of which they have original cognisance, is not a cause of prohibition. 2 Sid. 152. *Becks v. Chelsoke*.

In the case of Sir Richard Hawkins, vice-admiral of the county of Devon, who was prosecuted in the star-chamber, for abetting and comforting Hull, and other notorious pirates. It was there resolved that, by the common laws, the admiral ought not to meddle with any thing done within the realm, but only with things done upon the sea; and also by the statute of 13 Rich. II. cap. 5. 2 Hen. IV. cap. 11. It was likewise resolved, that the said statutes are to be intended to hold plea, and not of a power to award execution; for the judge of the admiralty, notwithstanding these statutes, may do execution within the body of the county.

Where one admits the jurisdiction of the admiralty by pleading there, no prohibition shall be granted. *Jennings against Audley*, 2 Brow. 30. 12 Rep. 77. Therefore, on a motion for a prohibition in a suit for seamen's wages there, the suggestion was, that the court below refused to allow the defendant's allegation; that the place, where the plaintiffs entitled themselves, was not a port of delivery: this is no foundation for a prohibition; if any thing, it must be an appeal.

Craddock bought divers things within the body of the county, which concerned the furnishing a ship, as cordage, &c. the vender sued him in the Admiralty-court; a prohibition was granted, 2 Brow. 37. *Craddock's case*, Owen 122. 3 Keeble 552. *Merryweather against Mountford*. Note, No appeal from the admiralty before a definitive sentence. *Lord Raymond* 1248.

The defendant being master of a ship, of which the plaintiff was owner, the ship was taken by pirates upon the sea; and to redeem himself and the ship, he contracted with the pirate to pay him 50 l. and pawned his person for it; the pirate carried him to the isle of Scilly, and there he paid it with money borrowed, and gave bond for the money at his return; after the redemption both of the ship and himself, he sued in the admiralty for the 50 l. and had a sentence for it, and thereupon a prohibition to the admiralty was prayed, but denied; because the original cause began upon the sea, and whatever followed was but accessory and consequential. *Hard*. 183.

Prohibition was granted to the Admiralty-court, on the 22d. and 23d Car. II. cap. 26. sect. 11. in suit there, for the forfeit of a ship on selling wares in Ireland without breaking bulk, being put into Ireland from America, by contrary winds, this being triable in the plantations, or any court of record in Westminster. *Pidgeon v. Trent*, 3 Keeble, 640. 647. 651.

A master of a ship agreed with certain merchants concerning a voyage, and received orders from them to lay in provisions of meat and drink, and to provide mariners, &c. and after the voyage was finished, the merchants refused to pay the master of the ship what they

had agreed for; upon which he libelled against them in the admiralty; prohibition was granted upon the statute of 2 Rich. II. cap. 3. the contract being upon land, and denied the case. *Hill*. 8 Car. I. Cro. 296. which saith, that when a thing is in its nature maritime, as in the cases of mariners wages, the admiralty shall have the cognisance of it. *Woodward against Bouishan*, *Raymond* 3, and 3 *Levinz* 60. *Coke against Cretcher*, &c. 2 Vent. 181.

If a contract or obligation be made upon the sea, yet, if it be not for a cause marine, the suit upon this shall be at common law, not in the admiralty. *Hob*. 11.

If the original contract be made at sea on a marine cause, and after reduced into writing at land, the common law, not admiralty, shall have the cognisance. *Hob*. 79, 212. *Palmer against Pope*.

If a charter-party be made in England to do certain things in divers places upon the sea, though that no act is to be done in England, but all upon the sea, yet no suit shall be in the admiralty for non-performance of the agreement; for the contract is the original, and is out of their jurisdiction; and where part is triable at common law, and part in the admiralty, the common law shall be preferred. *Maldonado v. Slaney*. 1 Roll. Abr. 532, 533.

A contract laid to be made *intra fluxum & refluxum maris*, &c. is well enough laid to give the admiralty a jurisdiction: it was upon the high seas when the water was at high-water mark, and it might be at land when the water was at low-water mark. In that case there is *divisum imperium* between the common law, and admiralty jurisdiction. *Lord Raymond* 1453.

It was moved for a prohibition to the admiralty, because the libel was to execute a sentence of the *Alcade*, which is the admiralty at *Malaga* in *Spain*, upon a thing done within a port there, and, after a rule for a prohibition *Nisi*, it was moved that no prohibition should be; for though this court will not execute the sentences of any foreign court, inasmuch that is governed by a direct law, yet these of the admiralty may, and it is their use to do so; for this, that all the admiralty courts in Europe proceed by the same law, viz. the civil law, and *Wibrel* and *Wiat's case*, 5 Jac. was cited to be adjudged accordingly. But, upon reading the libel in the principal case, it appears that the sentence was not definitive, but interlocutory, concerning a matter that founds as an action upon the case, and no sum set; and also the *Alcade* is not as an admiralty there, and for this a prohibition was granted. *Jurado v. Gregory*, 1 Sid. 418. 1 Lev. 267. 1 Vent. 32, and 2 Keeble 512, 610.

Motion for prohibition to the admiralty, for that they libelled against one for rescuing a ship, and taking away the sails from one that was executing the process of the court against the said ship, and for that, in the presence of the judge and face of the court, he assaulted and beat one, and spake many opprobrious words against him. Now, seeing that these matters were determinable at law, the ship being *intra corpus comitatus*, and they could not adjudge damages to the party, or fine, or imprisonment, a prohibition was prayed, but denied; for they may punish one that resists the process of their court, and may fine and imprison for a contempt, though they are no court of record; but, if they should proceed to give damages, they would grant a prohibition as to that. *Sparks*, &c. against *Martin*, 1 Vent. 1. The same doctrine *Lord Raymond's Rep.* 446. and 1 Vent. is there cited.

Suit in the admiralty, the defendant pleaded the statute of limitation; if that court deny the plea, prohibition will be granted; or if they do receive the plea, but will not give sentence accordingly, prohibition will go. *Hardress* 502. *Berkely v. Morris*.

A prohibition prayed to the admiralty, where there was a libel for a ship taken by pirates, and carried to Tunis, and there sold, for that it did not appertain to the court to try the property of the ship being sold upon land. In regard it was taken by pirates, it is originally within the admiral jurisdiction, and so continues, notwithstanding the sale afterwards upon the land. Otherwise, where the ship is taken by enemies, for that alters the property. Contrary to *Lord Hobart* in the Spanish ambassador's case, 78. 1 Vent. 308. 3 Cro. 685. After sentence

sentence in the admiralty court for the seizing of a ship, *trover*, and conversion at law will not lie. *Beake contra Thynwhitt*, *Laws of the Sea*, 425.

Cafe upon the statutes of 13 *Rich. II. c. 5.* 15 *Rich. II. c. 3.* and 2 *Hen. IV. c. 11.* for suing in the admiralty for matters done upon land. The ship of the plaintiff was arrested in the port of London, with goods going to the East-Indies, by which the plaintiff lost the profit of his voyage. The East-India company having an exclusive charter by the statute, 13 *Car. II.* petitioned the king in council to stay the ship, and an order was made to the admiralty to stay the ship by their process, which was issued accordingly; all which was done by the defendants as agents of the company, and they, as agents, paid the fees of the prosecution; and, if guilty, damages for the plaintiff in *duplo* 1500 l. and so upon arraignment judgment for the plaintiff, and an error affirmed. *Sands* against Sir *Josias Child* and others. 3 *Lev.* 351. A like case, 1 *Vent.* 47. *Home* against *Ivie*.

ADMIRALTY is also said of the jurisdiction or court in France, where justice is administered in the name and under the authority of the admiral. The admiralty general of France sit at the bench of the marble table, in the hall or court of Paris, every Monday, Wednesday, and Friday in the week; it is composed of a lieutenant-general, who presides, a particular lieutenant, three counsellors, the king's advocate and solicitor, a chief register, or secretary, and two ushers, or sergeants. All these officers, as well those of the general and particular courts of admiralty, established in the ports and harbours of the kingdom, are appointed by the admiral, but they must have their commissions from the king.

The jurisdiction of the judges of the admiralty has been regulated by Title XI. of Book I. of the ordonnance of the marine, or navy, of the month of August, 1681.

ADMIRALTY of *Holland*. The admiralty of the States-General of the United Provinces is divided into five colleges, which are those of Amsterdam, Rotterdam, Hoorn, Middleburg, and Harlingen.

Each college has its particular officers; namely, an advocate-fiscal, a receiver-general, a commissary-general, several secretaries and registers, an overseer of the sailors, a commissioner of sales, a treasurer pay-master, a grand-provost, and many officers for the inspection of passports, and the receipt of duties.

That the reader may have a more complete notion of all those colleges, and of their rights, privileges, and functions, we shall give a particular account of that of Amsterdam, which will be sufficient to make the others known.

The college of Amsterdam is composed of twelve lords, called counsellors of the admiralty. Of these twelve lords, one is deputed by the nobility of Holland, one by the city of Amsterdam, one by that of Leyden, one by Haarlem, one by Gouda, and one by Eadam. The other six are chosen by the other provinces, viz. Guelderland, Zealand, Utrecht, Groningen, with the Ommelanden and Overysse.

These lords of the admiralty have the right of taking cognizance of all the cases that happen in respect to the frauds, malversation, and contraventions committed against the placarts and ordinances relating to the navy; as well concerning the duties of export and import of merchandize, as to take care that the prohibitions relating to contraband goods be observed; upon all which cases they pass sentence summarily and sovereignly, excepting, however, such civil matters in which the sum in dispute amounts to above 600 florins: in these cases a man may remove the cause by appeal, before the States-General, and have a rehearing of it.

Passes must also be taken out from the admiralty, and they are distributed in the chambers, or offices, which are called simply convoys; and this is also the name given to the duties of export and import, paid on merchandizes. At Amsterdam the convoy is kept in the prince's court, which is a great building, where the college of the admiralty sits.

All the duties of import and export, paid by goods imported into, or exported from, the United Provinces, are paid to the admiralties; each college of which has its offices and officers for that purpose.

Those of the college of Amsterdam are at the entrance of the city, on the side next the gate called Boorn. When boats go to, or return from, any ship, with merchandize, the officers have a right to visit them, and examine whether they have not more goods on board than are contained in the pass, in which case they may stop them; however, they are not allowed to break open or unpack any thing before notice be given to the commissary-general.

ADRAGANTH, or TRACACANTH, or DRACANT, is the gum of the goat's-thorn C.B. of the hoary Cretan goat's-thorn, with a small flower streaked with purple lines. *Tournefort*.

Tragacanth is a gummy concrete juice, which exudes, both spontaneously, and from wounds made in the trunk and branches of the plant, which grows in Crete, Asia, and Greece. It is brought to us from Turkey, either drawn out into long vermicular pieces, and bent into a variety of shapes, or run together in lumps; of a white, yellowish, brownish, or blackish colour, semi-transparent, dry, yet somewhat soft to the touch, and of very little taste or smell. It should be chosen white, resembling fish-glue, in small curled sprigs, and free from any visible impurities. It neither dissolves in spirit or oils. Macerated in a small quantity of water, it forms a thick, mucilaginous juice, which does not perfectly dissolve in a larger. From its smooth and emollient quality, it is thought proper for abating the acrimony of the humours, and therefore useful in such coughs as proceed from catarrhs and effluxions of rheum; it is likewise strengthening in seminal weaknesses, and very good against the *fluor albus* in women: it is also of other use in medicine, for the composition of electuaries, for diseases of the eyes, and for making several kinds of trochisks; but the greatest consumption made of it is by several mechanics and artificers, who employ it in various works. The skinner and curriers, who use considerable quantities of it in the preparation of their leather, prefer the brown or blackish sort; for all other purposes the white is the best.

Mr. Miller observes in his *Gardener's Dictionary*, that, notwithstanding what *Tournefort* has said concerning this gum being produced from that particular species which grows in Crete, yet many authors are of opinion that it is taken from other species, particularly that of *Marseilles*, from whence that gum is often brought into England.

ADRIATIC-SEA, is noted for the first settlement of the Venetians. In the bottom of this sea there were a quantity of small marshy isles, separated only by narrow canals, but covered, and as one may say, secured by divers morasses, which rendered the taking them almost impracticable. Here some fishermen retired, and lived on the small traffic which they made with their fish, and of the salt which they drew from the ponds on some of these isles.

It was these islands which served for a retreat to the Venetians, a people of that part of Italy which is along the Gulf, when Alaric king of the Goths, and afterwards Attila king of the Huns, came to ravage Italy, particularly after that this last (who highly merited the name of the Scourge of God, which he had given himself) had taken Padua and Aquila, and had reduced them to ashes.

These new inhabitants of the morasses did not at first compose any body politic, but each of these seventy-two isles of this little Archipelago had, for a long time, their proper magistrates, and, as one may say, a separate sovereignty.

When the commerce became so flourishing as to give jealousy to their neighbours, the Venetian Islanders thought of forming themselves into a republic, and it was this union (first begun in the sixth century, but not perfected till towards the middle of the eighth) which laid the most solid foundations of the power and commerce of the Venetians, particularly of the latter, which during more than four ages, had not, in any respect, its equal in all Europe.

Until the union of the isles, the trade of their inhabitants spread but little beyond the coasts of the Mediterranean; but the establishment of the new republic, having

ing given courage and strength to their merchants, their fleets were in a short time seen to visit the most distant ports of the ocean, and afterwards those of Egypt; and by the treaties made with the sultans, under the pope's approbation, secured the trade of spices and other rich merchandizes of the East, which they were to purchase at Cairo, a new city the Saracen princes had built on the banks of the Nile.

The riches of the Venetians increased to such a degree, by the commerce with Egypt, that they thought themselves strong enough to undertake some conquests, and to form, from the taking a number of important towns, what they called their state of *terra firma*, which rendered them yet more considerable in Italy, though they lost a part after the famous league of Cambray.

Animated by these first successes, and supported by the resources of their commerce, and by the inexhaustible funds, which their merchants were capable of furnishing to the treasury of the republic, Venice happily carried her arms yet farther, and extended her conquests on the side of the Morea, and in many of the principal isles of the Mediterranean and Archipelago, which she subjected to her dominion; and, to complete her glory, she had a great share in almost all the croisades which were made for the recovery of the Holy Land, or for the succour of the Christians of the Levant, as well as the taking of Constantinople, and the conquest of the best part of the Grecian empire, which passed under the dominion of the French princes, in the beginning of the thirteenth century.

Venice was in this state of prosperity and glory, when she experienced the lot of so many powerful cities, which the fall of their commerce had either ruined or weakened; she found, in the diminution of her own, the fatal term of that puissance which had given umbrage to so great a number of princes combined to her destruction, who signed the treaty of Cambray in 1508; and two of her most celebrated historians take particular notice, that their sage senate had not had so much trouble to re-establish their public affairs after the famous battle of Aignadel, but because the republic could not any longer find the same resources as heretofore, in the trade of the merchants, already greatly enfeebled by the loss of that of the spices, which the Portuguese had begun to carry from them, and which was yet diminished from another side by the Provincials, particularly by those of Marseilles, who became in greater esteem than the Venetians at Constantinople, and in the principal sea-ports of the Levant, and who knew so well how to maintain their credit, that very soon all the commerce of those parts was only carried on under French colours. See VENICE.

ADVANCE, *an anticipation of time*. Money paid by way of *advance* is money paid before goods are delivered, work done, or business performed. To pay a note of hand, or bill, by *advance*, is to pay the value before it becomes due, for which a discount is usually taken.

ADVANCE signifies also loan of money, or supplying with merchandize. "I am upon advance with such an one: that is, I have lent him considerable sums; I have supplied him with abundance of goods, and do not know when I shall be reimbursed."

ADVANCE. In the terms of bills of exchange, they say, *advance* for the drawer, when, upon a negotiated bill, the person who has negotiated it, receives above par upon it, that is, more than the sum contained in it. On the contrary, they say, *advance* for the payer, and loss for the drawer, when he, to whom the bill belongs, does not receive the full value of it.

To **ADVANCE**, to be at the expence of an undertaking, before the time arrives for being reimbursed. Abundance of money must be advanced in fitting out ships, before any returns come to hand; he has advanced all the costs of that manufacture, &c.

ADVANCEMENTS of money in the Bank. Besides discounting bills, the Bank will advance monies on government securities, or on a deposit of specie or bullion, but never on jewels, or estates; and they will likewise buy gold and silver bullion (after assaying) Spanish dollars, &c. though seldom at so high a price as private purchasers, these latter often buy for their own use, but the Bank

by way of merchandize, on which a profit is expected. See BANK.

ADVENTURE, a term used in commerce by sea, which the French seldom employ without adding to it the epithet *grosse*; *mettre de l'argent à la grosse aventure*, that is, to apply money in order to share in the profits of ships.

The English, instead of *adventure*, vulgarly use the word *venture* for a small parcel of goods, &c. sent with a friend that goes to sea, to any part of the world.

ADVENTURER. A merchant's ship is called an *adventurer* that goes to traffic within the limits of a grant to a trading company, without having obtained their permission.

ADVENTURER, signifies also a person little or not known in public business, who boldly thrusts himself into affairs, and proves a trickster: all prudent merchants ought to be well aware of such persons.

ADVENTURERS, so were called those bold and enterprising pirates, who joined together against the Spaniards in the West-Indies, and formed enterprises against them both by sea and land, which would scarce be credible, if the French *adventurers* of St. Domingo had not in some measure verified them, by the taking of Carthage under Messieurs de Pointis and du Caffé. The name more usually given them is *Buccaneers*, though not so honourable. See *BUCCANEERS*.

Merchant-ADVENTURERS, are merchants that adventure their goods to sea, and trade to foreign parts; so called, in contra-distinction to such as carry on only an inland or home trade.

ADVENTURERS, those also are called so, who undertake either by themselves, or in companies, the settlement of colonies and plantations in America, which distinguishes them from the planters, by the name of proprietors of such lands, colonies, or plantations.

The latter are employed in planting and cultivating the lands, and the others lend their money, and hazard or adventure it, in hopes of the profits they are to receive thereby. These are what, properly speaking, are called in France, *actionnaires*; the others, inhabitants, colonists, and grantees. In this sense we find, in the collection of the charters of England, the adventurers and planters in Virginia, the adventurers and planters of New England, and so of the rest; the charters granted for new colonies always distinguishing those kinds of parties concerned, and granting them different privileges.

ADVENTURINE, or *AVENTURINE*, a precious stone of a yellowish-brown colour, full of little specks, which seem to be of gold. There are pretty fine pieces of it found in Bohemia, Silesia, and different parts of France.

This stone takes the polish easily, but then it easily breaks. It is used in the finest inlaid works: snuff-boxes, patch-boxes, and watch cases, are also made of it.

There is a counterfeit *adventurine* made with the filings of brass, and powdered glass (whilst they are in fusion over the fire) to which a yellow tincture is given; but the factitious *adventurine* never comes near the genuine and natural.

To **ADVERTISE** any thing that is lost, or stolen, which the French call *recommander une chose perdue*, is, with them, to send to all the merchants or traders, who might purchase the same, tickets, or notes, containing a description of the thing, its nature, quality, form, &c. that, in case it be offered them to sale, they may stop it, and give proper notice. This is much after the same manner as is practised here in London, with regard to any piece of plate that is lost, of which notice is given to all the silver-smiths. But we generally *advertise* here in England in the Gazette, or in any other of the printed news-papers. It is also customary in Holland to give notice by the public crier.

Advertising in the news-papers, in regard to matters of trade and business, is now grown a pretty universal practice all over the kingdoms of England, Scotland, and Ireland; and it seems to be a very natural way for men of business of any kind to communicate what they have to propose to the public. It is the way, indeed, by which the government impart their intentions to the kingdom

kindom in general, the Gazette, printed and published by authority, being nothing more than a kind of public *advertiser*, for the information of the whole community. The great trading and monied corporations practise the same, as being the best method of letting the public know their proceedings. And however mean and disgraceful it was looked on a few years since, by people of reputation in trade, to apply to the public by advertisements in the papers, at present, it seems to be esteemed quite otherwise; persons of great credit in trade experiencing it to be the best, the easiest, and the cheapest method of conveying whatever they have to offer to the knowledge of the whole kingdom.

ADVICE, advertisement, instruction given to a person concerning something that he did not know. To give *advice* is used to signify, the communicating to another, by letter, what passes.

The merchants of Provence sometimes use the term *advifo*, which they have adopted from Italy.

A letter of *advice* is a letter missive, by which a merchant, or banker, informs his correspondent, that he has drawn a bill of exchange upon him; that his debtor's affairs are in a bad state, or that he has sent him a quantity of merchandize.

To letters of *advice* concerning the sending of goods, the invoice is usually annexed. See INVOICE.

In regard to letters of *advice* for the payment of a bill of exchange, they ought to contain the name of the person for whose account it is drawn, the day, month, and year, the sum drawn for, and the name of him from whom the value is received. It ought also to mention the person's name to whom it is payable, and the time when due; and, when bills of exchange express the payment to order, that ought also to be specified in the letter of *advice*.

A person may refuse excepting a bill of exchange, when he had not advice of it.

ADVICE, is also used for opinion, or counsel. This is my advice, or opinion. I have done nothing in this, but by the opinion and advice of the most skilful merchants.

ADVICES, how to be given the Bank for payment of bills, and what those drawn on by commission must give. If you have any accepted bills payable in London, and to save yourself the trouble, have a mind that the Bank should recover them, you must indorse, and carry them with your book to the Bank, and have them entered by the proper clerks, who sit at one end of the great hall; and after this deposit, they will be carefully recovered, or duly protested; if the former, their import will be credited to your account; if the latter, the bills will be returned, and the charges of protesting debited you.

If you would have the Bank pay any bills that are drawn on you, you may accept them payable at the Bank; and in this case you must, before they fall due, give the Bank an order to pay them when presented, *advising* their contents, from whence, and by whom drawn, &c. or you may, at the time of acceptance, write an order on them to the cashiers (as a draught) to pay them when due, though besides this, a separate order must be left there for their discharge.

It is the duty of every one drawn on by commission, to advise the drawer (immediately on hearing of the draught) whether he will accept it or not, on the condition, and for the account of him for whom it was made; and if the bill be for the account of a third person, the acceptant must give him *advice* also of the drawer and sum passed on him for his account, and add when it falls due, and whether he will honour it or not.

He that is drawn upon for the account of a third person, from whom he has received no orders for accepting, nor is in cash for him, neither hath directions to re-value on the principal, acts prudently if he suffers the bill to be protested for non-acceptance, unless he knows the drawer to be a responsible man, and this inclines him to accept (*supra protest*) for his honour, which he may do if he pleases, and oblige the drawer afterwards to make him satisfaction; but in this case he ought immediately to *advise* the drawer of such his acceptance under protest.

He that is drawn on for the drawer's account, or that of a third person, and scruples to accept it for the one or the other, either freely or under protest, may accept the same in honour of any indorser (*supra protest*) that he thinks proper to trust, and is then obliged to give the drawer, and the person for whose account it is, and also the indorser for whose honour he accepts, *advice* thereof; and to send the protest, with the instrument of acceptance, to the indorser, that he may use it against the drawer.

When the acceptant hath accepted a bill (*supra protest*) in honour of the drawer or any indorser, for want of *advice*, order, or provision, from him for whose account the bill is drawn, and he afterwards receives both orders and effects, he is then obliged to free the drawer and indorser from their obligations, and to *advise* them that he will pay the draught for his account for whose it was drawn, and that he therefore discharges them.

If any one accepts a bill with the drawer's obligation, he must at the day of payment *advise* the drawer, whether he, for whose account the bill was drawn, had made provision for it, or otherwise disposed its payment, and if this was done, he in consequence discharges the drawer from his obligation.

When any one is drawn on for the account of a third, by another with whom the acceptant never had any correspondence, and consequently must be ignorant of his Firm, he ought to be deliberate in his acceptance, though he has orders from his principal to honour such draughts, and should rather wait for the drawer's *advice*, that he may compare his letter and bill, than be precipitate in this acceptance.

TO ADULTERATE, is to mingle something foreign to its kind, with any substance, or to debase any thing with bad ingredients. To *adulterate* or counterfeit the coin, is a capital crime in all nations.

ADULTERATION, the act of debasing or corrupting a thing, by mixing it with others. The *adulteration* of medicines, is the debasing those which are genuine, or counterfeiting them by others, which resemble them in appearance but not in efficacy. This scandalous practice has been complained of in all ages; but is at present become a trade so common, that unless some method be discovered to stop this growing evil, the practice of physic will be rendered utterly useless; for though the physician may prescribe with great judgment, yet the medicines, if so artfully adulterated, as not to be discovered but by the effect, will, instead of producing salutary effects, prove prejudicial to the patient.

ADY, the palm-tree of St. Thomas. It is a very tall tree, exceeding even the pine in height, with a thick bare upright stem, growing single on its root, and full of juice. Its leaves resemble those of the cocciferous palm-tree. Its head shoots forth into a vast number of branches, which being cut off, or an incision made therein, a proper vessel is hung up to receive the tears or juice which flows from the wound. This is used by the Indians instead of wine, and readily intoxicates. It is sweet when new, but turns sour in a few days: the rest of the branches which escape unhurt never fail of bearing fruit.

ÆGYPT. See EGYPT.

ÆGYPTIACUM *Unguentum*, in pharmacy, the name of a composition originally ascribed to Mesue, and received by most of the dispensatories which have been since written, without any material alteration. It is compounded of verdigrease, honey, and vinegar, boiled to a proper consistence. The scum of this ointment is called *mel Ægyptiacum*, Ægyptian honey. Surgeons recommend the ointment as an admirable detergent, and very proper to keep down fungous excrecences in ulcers; but it is too corrosive, except mitigated according to the circumstances of the case. It would perhaps be somewhat difficult to account for the name of this ointment, because none of the ingredients bear any analogy to Ægypt. Aetius, however, observes that a certain Ægyptian made use of a medicine for the cure of an *achor*, wherein verdigrease was a principal ingredient, to which probably the name may owe its origin. Dr. Quincy says it takes its name from its dusky colour, wherein it resembles that of the natives of Ægypt.

AEM, AM, or AME, a liquid measure, used in almost all parts of Germany. It is not the same as the *aam* of Amsterdam, though nearly resembling it in name; neither is it alike in all the cities and towns in Germany. The *aem* is commonly of twenty vertels, or eighty maffes. At Heydelberg it is of twelve vertels, and the vertel of four maffes, which reduces the *aem* to forty-eight maffes; and in Wirtemberg the *aem* is of sixteen yunes, and the yune of ten maffes, which makes the *aem* amount to 160 maffes.

ÆRUGO, rust of any metal, particularly of copper, called verdigrease. See VERDIGREASE.

ÆS, Copper. See COPPER.

ÆS Ustum, a chemical preparation made of thin leaves of copper, sulphur, and nitre placed in a crucible layer upon layer, or as the chemists say, *stratum super stratum*, and set on a charcoal fire till the sulphur is wholly consumed. It is chiefly used in colouring glass, to which it gives a beautiful tincture. Physicians sometimes prescribe it, but with great precautions; surgeons apply it to eat off proud flesh and excrescences in the cure of wounds. The goodness of *æs ustum* consists in its thickness, which ought to be middling; in its colour, which ought to be of an iron grey on the outside, reddish grey within, and when two pieces are rubbed together, of a red like that of cinnabar. It must also be brittle and glittering when broke. The best *æs ustum* comes from Holland.

ÆSCHYNOMENOUS Plants. Those which are generally called sensitive, as giving some tokens of sense, have received this appellation. They are such, whose frame and constitution is so nice and tender, that on the touch or least pressure of one's hand, they will contract their leaves as if sensible of the contact.

ÆSTUARY, in Geography, signifies an arm of the sea which runs a good way into the land.

ÆSTUARY, in Physic, is the name of several instruments, contrived to convey heat to the whole, or particular parts of the body. Blancard explains it a *vapour-bath*, which is but one species of *astuary*.

ÆTHER, in Chemistry, is an extremely light and penetrating fluid, made of spirit of wine deprived of its phlegm by distillation with oil of vitriol, and then precipitating the sulphureous gas with an alkali. This æthærial spirit is one of the most noble and useful menstrua in all chemistry; for all essences and essential oils are extracted by it immediately, without the mediation of fire, from woods, barks, roots, herbs, flowers, berries, seeds, &c. Thus, from castor may be extracted an oil, sweeter than that of cinnamon; also, the true oil of saffron, &c. For if you pour on the ingredient, in a proper vessel, a spoonful or two of the æthærial liquor, and after it has stood an hour in a cold place, fill up the vessel with cold water, you will see the essential oil swimming upon the water, which may be easily separated by the funnel. Of this essential oil, one drop only upon a lump of sugar manifests the taste, &c. the medicinal virtues of the plant, exquisitely drawn out, comprehended in this essence. In like manner the essential oils of exotics are easily extracted. It is not however a true essential oil, but an excessive strong tincture, or essence.

ÆTHERIAL Oil, in chemistry, is a fine subtile oil, approaching to the nature of a spirit.

ÆTHIOPS MINERALIS, æthiops mineral. A medicine compounded of mercury and sulphur, prepared either with or without fire.

The method of making the *æthiops* with fire, is to melt any quantity of sulphur in an unglazed earthen vessel over the fire, and mix with it during the fusion, an equal quantity of mercury revived from cinnabar, by means of an iron spatula. After which, the mixture must be set on fire, to consume the sulphur, and the remaining mass, which is black, friable, and heavy, is the *æthiops mineral*.

The *æthiops* without fire, is made by rubbing equal parts of crude mercury and flowers of sulphur together in an iron or glass mortar, till they are intirely incorporated into a black powder.

Various are the accounts given of this medicine by authors; some recommend it in all foulnesses of the skin, old ulcers, every species of the venereal disease, and all agree that it is effectual against worms. But Boerhaave is

of a very different opinion with regard to the virtues of this medicine. He affirms, that it cannot enter the lacteal vessels, but is discharged out of the intestines as it goes in; however, if it be attended with very good fortune, he says, it may possibly kill worms, and that this is all the effect it can have.

ÆTHIOPS ANTIMONIALIS, the name of a powerful medicine described by Dr. Cockburn, which is prepared as follows. Flux equal parts of antimony and sea-salt in a crucible for an hour, then let the matter cool, break the crucible, and knock off the scoria; then rub equal parts of the regulus, made in this manner, and mercury together, till they are incorporated.

This is a noble medicine, and will cure most chronic disorders of the skin, and is admirable in all sorts of obstructions. Hence it becomes serviceable in the king's evil, and most glandular diseases, and many chronic distempers, which are out of the reach of other medicines.

ÆTITES, or EAGLE-STONE, so called, as formerly supposed to be found in the eagle's nest, is a tophaceous crustated stone, of a dark, russet, or ash-colour, and generally of an oval figure, hollow within, and pregnant, as it were, with another stone rattling in its womb. Many wonderful virtues were ascribed to this stone by Galen, Pliny, and others of the ancients; but they seem to be intirely founded on superstition and fancy, and accordingly it is very rarely, if ever, used in the present practice of physic.

AFFA, an ounce weight of gold is so called on the coast of Guinca. The half-ounce is called *eggeba*.

AFFAIR, every kind of business and occupation, in which a person employs himself, or is concerned.

This term is much used in commerce, in which it has various significations. Sometimes it is taken for *bargain*, *purchase*, *contract*, &c. but equally in a good or bad sense, according to what is added by way of explanation. Thus they say: "such an one has made a fine affair of it;" to signify, that he has gained much. And on the contrary: "that has had a bad affair of it," when he has lost considerably by a *bargain*, *purchase*, *contract*, &c.

Sometimes *affairs* are taken for a merchant's fortune, and in this sense they say, "he is very well in his affairs," when he is rich and at his ease, without debts, and possessed of a considerable fortune: and that "he is ill in his affairs," when he has had great losses, and is much in debt.

AFFICHE, so the French call those bills or advertisements, which are pasted up in public places, to make any thing known.

The use of these public bills is very common in trade. They are put up for the sale of merchandizes and of ships, and to inform the public of ships setting out for voyages, as is done upon the Royal-Exchange of London. These last contain the places to which they are bound, those where they are to touch on their voyage, of what burden or number of tons they are, how many guns they carry, and their number of men. It is also by these bills, that the French trading companies inform the public, of the quality and quantity of the stuffs, linens, metals, drugs, spices, and other effects, which arrive on the return of their ships. The place of their arrival is usually mentioned in them, with the day, and often the conditions of sale. In a word, there are few things in trade, for which the French merchants may not sometimes be obliged to have bills pasted up, and very often to make known the new manufactures they are endeavouring to establish, or even the change of their place of abode, in order to keep their customers.

It is not allowed at Paris to cause bills to be pasted up, upon any pretence whatsoever, without having first obtained the lieutenant general de police's permission, or that of the superior judges, according to the nature of the case.

AFFIDAVIT, an oath written and signed, and properly sworn before some person legally authorized for that purpose. As traders are frequently called on to make *affidavits* of one kind or other, they should be made thoroughly sensible of the nature of them.

An *affidavit* is defined by divines and moral philosophers, a religious assertion, or asseveration, wherein a person

person invokes the Almighty, renounces all claim to his mercy, or even calls for the divine vengeance upon himself, if he speaks falsely. In a legal sense, it is a solemn action, whereby God is called upon to witness the truth of an affirmation.

There is nothing that has been more complained of, nor with more reason, by wise and good men in all ages, than the multiplying of oaths, more especially among the trading part of mankind, in the ordinary course of their business. I speak particularly with regard to Custom-house oaths, &c. which, I humbly apprehend, traders should by no means be liable to, for although traders, who support their reputation by their care, industry, and ability in business, are certainly as honest a class of men as any in the community; yet, as they are not impeccable, they have a natural right to be upon a level with the best of their fellow subjects, and not to be under the necessity of swearing to every thing they do, or transact; which they are daily obliged to do, in respect to the revenue.

There is no order of men in the community who labour under the like restrictions. Was the lawyer, the physician, or even the divine, to be obliged to swear to do rigorous justice, in all cases where their interest is concerned, it is to be presumed, that they might not be free from evil any more than traders are, in cases where their interest is concerned: such a law, it is to be feared, would tend rather to render oaths useless, than to support their solemnity.

"I have heard, says Mr. Locke, very sober and observing persons complain of the dangers men's lives and properties are in, by the frequency and fashionableness of perjury amongst us. Faith and truth, especially in all occasions of attesting it upon the solemn appeal to heaven by an oath, is the great bond of society: this it becomes the wisdom of magistrates carefully to support, and render as sacred and awful in the minds of the people as they can.

"But if ever frequency of oaths making them to be looked on only as formalities of law, or the custom of straining truth (which men's swearing in their own cases is apt to lead to) shall once dip men in perjury, and if the guilt with temptation shall spread itself very wide, and make it fashionable in some cases, it will be impossible for the society, these bonds being dissolved, to subsist: all must break in pieces, and run to confusion.

"That swearing in their own cases is apt, by degrees, to lead men into as little regard of such oaths, as they have of their ordinary talk, I think there is reason to suspect from what has been observed in something of that kind. Masters of ships are a sort of men generally industrious and sober, and I suppose may be thought, for their number and rank, to be equally honest with any other sort of men; and yet, by the discourse I have had with merchants in other countries, I find, that they think, in these parts, they take a great liberty in their Custom-house oaths; to that degree, that I remember I was once told, in a trading town beyond sea, of a master of a vessel, there esteemed a sober and fair man, who yet could not hold saying, "God forbid that a Custom-house oath should be a sin."

"I say not this to make any reflection upon a sort of men, that I think as uncorrupt as any other; and whom I am sure ought in England to be cherished and esteemed, as the most industrious and most beneficial of any of its subjects. But I could not forbear to give this here as an instance, how dangerous a temptation it is, to bring men customarily to swear, where they may have any concernment of their own. And it will always be worthy the care and consideration of law-makers, to keep up the opinion of an oath high and sacred, as it ought to be in the minds of the people; which can never be done, where frequency of oaths, biassed by interest, has established a neglect of them; and fashion (which seldom fails to do) has given countenance to what profit rewards."

The Chinese administer justice with great rigour in all their tribunals. When any person commences a suit against another, he lays his claim in writing before the court of judicature, and the defendant gives in his defence in writing, which he signs, and which he is obliged

publicly to hold up in court between his fingers.

These two writings are delivered in together; and, being examined, sentence is delivered in writing, and each party has his papers returned to him; but first they return the defendant his writing, that he may again acknowledge it.

When one party denies what the other affirms, he is ordered to return his writing; and if the defendant thinks he may do it safely, and accordingly delivers his papers a second time, they also call for those of the plaintiff, and then they say to him who denies what the other affirms, make it appear that your antagonist has no right to demand of you what is in debate; but take notice, if he makes out what you deny, you shall undergo twenty strokes of the bamboo upon the backside, and pay a fine of twenty fagugs, which make about two hundred dinars.

This bamboo punishment is such, as the criminal could not survive; it is so grievous, that no person in all China may, of his own authority, inflict it upon another, on pain of death, and confiscation of his goods; so that nobody is ever so hardy as to expose himself to such certain danger: wherefore justice is well administered to every one. They require no witnesses, nor do they put the parties upon oath; which is the chief reason for mentioning this custom in China.

To collect the public revenue, therefore, without compelling traders to swear perpetually, was one great motive to Sir Matthew Decker, for proposing his late scheme.

AFFINAGE, an action which purifies and refines any thing, to render it finer, neater, and better; as metals, sugar, &c. *Affinage* is sometimes used with us in law-books, for the refining of metals. See **REFINING**.

AFFIRMATION, in a legal sense, signifies an indulgence allowed to quakers, who, in cases where an oath is required, may make a solemn *affirmation*, that what they say is true; and if they make a false *affirmation*, they are subject to the penalties of perjury.

Their *affirmation* and declaration allowed by 7 and 8 Will. III. cap. 34. and 13 and 14 Will. III. cap. 4. are to be accepted instead of an oath, in all cases where by law an oath is required, continued for ever by 1. Geo. I. cap. 6. sect. 1, 2.

The said *affirmation* or declaration is to be adjudged to be in these words, I A. B. *do solemnly, sincerely, and truly declare and affirm*, that, &c. by 8. Geo. I. cap. 6. sect. 2.

Such solemn *affirmation* or declaration is to be adjudged to be of the same force and effect in all cases, as if an oath had been taken in the usual form, by 7 and 8 Will. III. cap. 34. sect. 2.

Convicted of a wilful, false, and corrupt *affirmation* or declaration, they are to suffer as for wilful and corrupt perjury, by 7 and 8 Will. III. cap. 34. sect. 3.

AFIOUME, or FIUME, a kind of flax, which comes from Egypt, by the way of Marseilles and Leghorn.

AFRICA, one of the four principal parts of the world, is south of Europe, and west of Asia, and is bounded on the north by the Mediterranean, which parts it from the former; and on the east by the Red Sea, which separates it from the latter, to which it only joins by that small isthmus, or neck of land, which cuts off the communication between these two seas, and is commonly known by the name of Suez. On the south and west, it is surrounded with the main ocean, so that it may be properly styled a vast over-grown peninsula, joined only to the continent of Asia by the isthmus above-mentioned. It extends a prodigious way, not only on each side of the equator, but of the tropics likewise, the southern verge of it reaching quite to the 35th degree of south, and the northern almost to the 37th of north latitude; whereby its utmost extent, from north to south, is almost seventy-two degrees, or about 4320 miles. From east to west it reaches still farther, viz. from seventeen west to sixty east, or seventy-seven degrees of longitude, that is, 4620 miles. It is of a triangular or pyramidal figure, the base being the northern part of it, which runs along the shores of the Mediterranean, and the point or top of the pyramid the Cape of Good Hope.

Its situation for commerce is certainly beyond any of the other quarters of the world. It stands, as it were, in the center between the other three, and has thereby a much nearer communication with Europe, Asia, and America, than any other quarter has with the rest; for it is opposite Europe in the Mediterranean, almost 1000 miles in a line east and west, from beyond Tripoli to Cape Spartel, at the straits mouth; the distance seldom 100 miles, no where 100 leagues, and often not twenty leagues.

It is opposite Asia all the length of the Red Sea, north and south; the distance sometimes not above five leagues, seldom fifty; and it fronts all the southern coast of Asia, viz. the coasts of Cilicia, and that of India, though at a greater distance, yet much nearer than any other country. It is also wonderfully accommodated for commerce, by the interposition of islands from Madagascar to Malabar; and more particularly by means of the alternate trade winds, which render the navigation safe, easy, and constant.

Lastly, it is opposite to America, about the distance of between 500 and 700 leagues, including the islands, by a coast of above 2000 miles; whereas America no where joins Europe or Asia, except where it may be a *terraincognita*, the former under a distance of 1000 leagues, the latter under that of 2500.

It is furnished with the greatest and most convenient navigable rivers, and perhaps with as many of them, as any other of the chief parts of the world; such are the Nile and Nubia on the north shore, running into the Mediterranean sea; the Niger, or Rio Grand, running into the Atlantic ocean, on the west-side of Africa; the Congo, the Zairi, and the Loango, three rivers of prodigious extent, south of the line, which empty themselves into the Ethiopic ocean on the same west-side, but beyond the Gold-coast: also the Natal, the Prio St. Esprit, the Melinda, and the Mozambo, all rivers of a very great length and breadth, which empty themselves into the Indian ocean on the east-side of Africa. Besides these, there are innumerable others, which though not equal to them, are yet very noble streams, fitted for navigation and commerce; and was this country blessed with a people qualified for trade and business, they might become the medium of an endless commercial correspondence.

It is, indeed, populous to a greater degree than commonly thought, the soil fruitful, and the air salubrious; and, if once a turn for industry and the arts was introduced among the natives, a greater quantity of the European produce and manufactures might be exported thither, than to any other country in the whole world. And, as in general they stand in great need of European commodities, so they have the most valuable returns to make for them. This is not the state of trade between Europe and Asia: Europe calls for a vast variety of goods from Asia, and Asia calls for more money than any thing else from Europe; yet there seems to be a kind of peculiarity in this trade, to the infinite advantage, particularly of the Indian and Chinese commerce, and the great disadvantage of most, if not all the nations of Europe: for the trade of Asia drains the whole western world of their ready money, in return for their mere products and manufactures. However, in the main, this is not such a disadvantage to Europe as some are inclined to think; and it need only be observed, that some great politicians have looked upon gold and silver in no other light than as commodities, which ought to be as freely exported and imported, except in our own coin, as any other whatsoever: and, if Europe at present contained all the gold and silver that Africa and America have ever produced, it is to be questioned, whether she might be said to be ever the richer, by reason that gold and silver would then be, as was said of Solomon's time, as plenty as the stones in the streets, and therefore of little or no value. So that a commerce which takes off from the Europeans some proportion of its silver, may be as necessary as any other, to keep its value equally with that of gold, the latter always finding its value according to the quantity of the former.

But to return to the valuable returns the Africans have to make, which the Europeans experience, from the

share of traffic they carry on with them at present; to what a degree they abound in gold, we have not only the testimony of the Portuguese, the Dutch, and the French, as well as the English, who have settlements on the coasts of Africa, but the vouchers of the most authentic historians. There is no country in the world, says Leo Africanus, richer in gold and silver, than some kingdoms in Africa, as those of Mandingo, Ethiopia, Congo, Angola, Butica, Quiticui, Monomotopa, Cafati, and Mehenemugi. By means of settlements of strength on the continent of Africa, the Europeans might, by the exchange of their commodities, draw into their hands all the gold of those countries. And here is a prodigious number of elephants, which would not only facilitate the inland intercourse of commerce, but also afford a very beneficial branch of traffic, in the teeth of these notable animals. In the same historian are numberless passages relating to those rich mines, and shewing how easy it would be for the Europeans to carry on a very extensive traffic with that part of the globe. This account of the great treasures of Africa is confirmed likewise by the Nubian geographer, who says, that the king of Guinea, the greatest city in all the countries of Negroland, has a mass of gold of thirty pounds weight, as it was naturally produced in the mine; which is completely pure, tough, and malleable, without having been smelted by the ordinary arts of refining that metal from its native ore. Father Labat has descended to a very minute specification of a great variety of rich mines, which, he says, are very shamefully worked by the negroes, by reason of their being totally ignorant of the nature of mining; nor have they ever yet come to the main vein of any of their mines. Copper is another valuable ore found in this part of the world. The quantity of it is not fully searched into, though there is good reason to believe it is so exceeding great, that it is commonly said amongst them, that the mountains which we call Atlas, are all copper. On the northern coasts they have such plenty of corn, that their fields, though but very meanly cultivated for want of a knowledge in agriculture, yield them an hundred fold increase. Gums, ivory, wax, civet, ostrich-feathers, are in such quantities, that any expence of them can scarce ever be mislaid: and in these warm climates, the country, besides what nature has of herself disseminated, is, and must be capable of improvement, in all the nicest and most estimable productions, which the well cultivated world supplies us with, from other places in the same latitude. It cannot be doubted but the fruitful rich lands every where to be found upon the coasts, and within the country, upon the banks of the rivers near the Gold-coast, and the Slave-coast, would produce all the richest articles of the East and West-India commerce. The spices of Banda, Ternate, and Amboyna, might be produced on the rich and fruitful shores of Melinda, on the east side, or of the Slave-coast on the west side of Africa; and that as easily, and to as great advantage, as where they are now produced; the latitude being the same, and the soil not unlike. The cinnamon of Ceylon, the tea of China and Japan, and the coffee of Mocha, would all three be produced on the same coast, from the Rio de St. Esprit, and southward to the river Natale; a temperate, fertile, healthy, and manageable soil. It has been affirmed that the sugars of Barbadoes and Jamaica, as also the ginger, cotton, rice, pepper, or pimento, with the cocoa, the indigo, and every other plant which comes from these islands, would be as easily produced in Africa, and the crops equally profitable and plentiful, if supported by the same industry as in America; and we are assured that ginger, cotton, and indigo, have been attempted by the English factories on the Gold-coast of Africa, where they have thriven to admiration. Upon the foundation of these facts, nothing seems wanting to render Africa equal by nature, if not in many respects, superior to any of the other parts of the world: for though the middle of it, lying between the tropics in the torrid zone, and under the line, is exceeding hot; yet even in the hottest part it is habitable and inhabited; and the people abound in plenty, have cattle, corn, cooling fruits,

fruits, shades and rivers, and live very agreeably and healthy; as, for instance, in the island of St. Thomas, under the very line; also on the Gold-coast, and in the kingdom of Benin and Angola on the west shore; and in Ethiopia, Melinda, the coast of Zanguebar, and several of the more intemperate places on the eastern shore. But making allowance for some of the inland countries remote from the sea, which we are told are without water, and therefore desert; yet are they not equal to the uninhabited coasts of Europe, Asia, and America. Notwithstanding this, Africa, in the respect of feeling no cold, has an advantage over the other parts of the world: the most northerly latitude is about 37, and the most southerly about 35 degrees; so that the far larger part enjoys the finest and most temperate climate. It is, however, melancholy to observe that a country which has near 10,000 miles of sea-coast, and noble, large, deep rivers, should yet have no navigation; streams penetrating into the very center of the country, but of no benefit to it; innumerable people, without knowledge of each other, correspondence, or commerce. At the entrance of these rivers into the sea are the most excellent harbours, prodigious in number, deep, safe, and calm, covered from the wind, and capable of being made secure by fortifications; but no shipping, no trade, no merchants, even where there is plenty of merchandizes. In short, Africa, though a full quarter of the globe, stored with an inexhaustible treasure, and capable, under proper improvements, of producing so many things delightful, as well as convenient within itself, seems utterly neglected by those who are civilized themselves, and its own inhabitants are quite unsolicitous of reaping the benefits which nature has provided for them. What it affords in its present rude, unimproved state is solely given up to the gain of others, as if not only the people were to be sold for slaves to their fellow creatures, but the whole country was captive, and produced its treasure merely for the use and benefit of the rest of the world, and not for their own.

Whether, instead of making slaves of these people, it would not rather become such nations that assume to themselves the name and character of Christians, to give them a relish for the blessings of life, by extending traffic into their country in the largest degree it will admit of, and introducing among them the more civilized arts and customs, may be submitted to consideration. The Dutch, by recommending their dress and introducing their customs in the Spice-islands, have wonderfully humanized the inhabitants, who were as strange in their manners as the negroes. But it is to be feared, that while the slave-trade with these people continues to be the great object of the Europeans, it will ever spirit up wars and hostilities among the negro princes and chiefs, for the sake of making captives of each other for sale. This, therefore, will ever obstruct the civilizing these people, and extending their trade into the bowels of Africa, which, by the contrary means, might be easily practicable. The obtaining a competent number of servants to work, as the negroes at present do, in the colonies belonging to the several European potentates, who have settlements in America, does not seem at all impracticable. Europe in general affords numberless poor and distressed objects for that purpose; and if these were not over-worked, as the negroes are in some of the American colonies, the Europeans would make as good servants for the planters as the blacks do; and, if also all the Europeans were upon a level in regard to the price of labour in their colonies, they would all, very probably, find their account in laying absolutely aside the slave-trade, and cultivating a fair, friendly, humane, and civilized commerce with the Africans.

Africa once contained several kingdoms and states, eminent for the liberal arts, for wealth and power, and the most extensive commerce. Then almost all the northern parts of Africa were full of people, from the Red Sea to the Atlantic ocean; the kingdoms of Egypt and Ethiopia were much celebrated, and the rich and powerful state of Carthage extended her commerce to every part of the then known world: even the British shores were visited by her fleets, 'till Juba, king of Maurita-

nia and tributary to Carthage, unhappily called in the Romans, who, by the assistance of the Mauritians, subdued Carthage, and made all the kingdoms and states in Africa subject to them. After this, the natives constantly plundered, and consequently impoverished by the governors sent from Rome, neglected their trade, and cultivated no more of their lands than might serve for their subsistence. Upon the decline of the Roman empire, in the fifth century, the north of Africa was overrun by the Vandals, a barbarous northern people, who contributed still more to the destruction of arts and sciences; and, to add to this country's calamity, the Saracens made a sudden conquest of all the coasts of Egypt and Barbary in the seventh century: these were afterwards succeeded by the Turks; and both being of the Mohammedan religion, whose professors carry desolation with them wherever they come, the ruin of that once flourishing part of the world was thereby completed.

Three different people inhabit this continent, namely, Pagans, Mohammedans, and Christians. The first are the most numerous, possessing the greatest part of the country from the tropic of Cancer, to the Cape of Good Hope, and these are generally black. The Mohammedans, who are of a tawny complexion, possess almost all the northern shores of Africa. The people of Abyssinia, or the Upper Ethiopia, are denominated Christians, but retain abundance of Pagan and Jewish rites: there are some other Christians upon the sea-coasts on almost every side of Africa; but the number is small, compared with that of the Pagans or Mohammedans. There are also some Jews on the north of Africa, who manage all the little trade that part of the country is yet possessed of. But it is remarkable, that though the Carthaginians, who inhabited this very country of Barbary, had greater fleets, and a more extended commerce than any other nation, or than all the people upon the face of the earth, when that state flourished, the present inhabitants have scarce any merchant ships belonging to them, and no other ships of force than what Saltee, Algiers, Tunis, and Tripoli, fit out for piracy, and these but few and small, their whole strength not being able to resist a squadron of European men of war.

There are scarce any two nations, or indeed any two of the learned, that agree in the modern division of Africa; and for this very reason, that scarce any traveler has penetrated into the heart of the country, and consequently we must be content to acknowledge our ignorance of the bounds, and even the names of several of the midland nations. These may still be reckoned among the unknown and undiscovered parts of the world; but, according to the best accounts and conjectures, Africa may be commodiously divided into ten parts, consisting of, 1. Egypt. 2. Ethiopia Superior. 3. Zanguebar, with Adel, all which lie on the east of Africa. 4. Monæmugi, Monomotapa, and Caffraria, called by some the Lower Ethiopia, which lie on the south. 5. Guinea, on the south-west. 6. Nigritia, or Negroland in the middle of Africa, extending almost quite through the country from east to west, on both sides of the great river Niger. 7. Zaara, or the Desert, to the northward of Nigritia. 8. Biledulgerid, the ancient Numidia, to the northward of Zaara. 9. The empire of Fez and Morocco, containing the north-west part of Africa. 10. The coast of Barbary, on the north, containing the countries of Algiers, Tunis, Tripoli, and Barca.

The Portuguese being the first that discovered the coast of Africa, they built one fort on the island of Arguin, on the north coast; another called St. George del Mina, on the Gold-coast; and a third at a place called Loango St. Paul's, on the coast of Angola, to the southward of the equinoctial line. By virtue of these possessions, they not only claimed, and for many years enjoyed, the right in and to all the said lands and countries, but likewise seized and confiscated the ships of all nations, as often as they found any of them trading on any part of the said coast.

About the latter end of the reign of king Edward VI. some London merchants fitted out the first English ships that ever traded to Guinea; and in the reign of queen Mary, and for the first ten or twelve years of queen Elizabeth,

zabeth, sundry other private ships were fitted out for the same parts; but the English not having as yet any settlements or plantations in the West-Indies, and consequently no occasion for negroes, such ships traded only for gold, elephants teeth, and malaguetta; and all such voyages were undertaken and performed at the hazard of losing the ships and cargoes, if they fell into the hands of the Portuguese, without the least ground to hope for any redress or satisfaction for the same.

Queen Elizabeth, in the 30th year of her reign, being then at war with Spain and Portugal, erected a company for the better discovering and carrying on a trade from the northernmost parts of the river Senegal, and from and within that river, all along that coast, unto the southernmost part of the river Gambia, and within the same; and gave and granted unto them the whole and sole trade in, to, and from the said rivers and countries, for a certain term of years; with prohibition to all others her subjects to trade to the same places, on pain of forfeiture of ships and goods: and these were the first English merchants that ever traded to the coast of Guinea, by and under the authority of the crown of England.

In the reigns of the kings James and Charles I. and during the time of the usurpation, several persons were encouraged by public authority, to trade to other parts of Africa, and to take such measures for the better carrying on and improving the same, as they should judge most proper. In pursuance whereof, they built one fort at a place called Cormantine, on the Gold-coast, and another on the river Gambia, on the north coast; and these were the only places of any consequence which the English were in possession of at the Restoration.

King Charles II. soon after his restoration, being made acquainted with the dangerous and precarious state and condition to which the trade of his subjects in those parts was reduced; and having likewise received many complaints touching the interruptions given to, and depredations committed upon, the ships of this nation, by the Dutch West-India company on the coast of Africa, it became necessary to consider not only of a proper method for protecting and securing the said trade for the future, but likewise how and in what manner reparation might be obtained for such damages and depredations. The result was the institution of the company of Royal Adventurers of England, trading into Africa, by letters patent under the great seal of England, bearing date the 10th of January, 1662. But this company, though they kept their footing in Africa, yet, by reason of the consequences of the wars with the Dutch, which the nation was then obliged to engage in, they had so many difficulties to struggle with, that they consented to surrender their charter to the crown. This was in consideration of a certain sum of money, to be paid unto them by another new company, then intended to be established. The terms of the surrender being accepted, his majesty established and incorporated a new Royal African company, by his letters patent under the great seal of England, bearing date the 27th of September, 1672; and granted unto them all and singular, the lands, countries, havens, roads, rivers, and other places in Africa, from the port of Sallee, in South Barbary, to the Cape of Good Hope, for and during the term of 1000 years; with the sole and entire trade into these countries, and a prohibition to all his other subjects to visit or frequent the same, without the licence and consent of the said company: and also, with such other powers and privileges, as were then judged proper and necessary, for enabling and encouraging them to undertake so hazardous and chargeable a work.

This new company met with all possible opposition from the French and Dutch, and sustained particularly several considerable losses by means of the wars with the French in the reign of king William III. inasmuch, that the parliament in 1697, taking the trade to Africa into consideration, thought fit, as a further means of enlarging and improving the same, to lay it open to all his majesty's subjects for thirteen years; and in regard that the Royal African company of England had been at the charge of building and maintaining a considerable number of forts and castles on the said coast, which the

parliament likewise judged necessary to be kept up and maintained in future, for the preservation and better carrying on the said trade, they were further pleased to impose a duty of ten *per cent. ad valorem*, on all goods and merchandize exported to Africa, during the said term, to be answered and paid to the said company for enabling them to keep and maintain their forts and castles.

This act continued in force from the 24th of June 1698, to the 24th of June 1712; in which time the charges the company were at in maintaining their forts and castles amounted, at a medium, to about 20,000 *l. per annum*, and in fourteen years, to 280,000 *l.* in the whole. The duty which the separate traders paid in the same time, amounted, in the whole, to 73,785 *l.* 10 *s.* 6½ *d.* and no more; and ten *per cent.* upon the company's own exports for the same time amounted to the sum of 36,387 *l.* 13 *s.* 1½ *d.* From whence it appears, that, even while the act continued in force, the total of the ten *per cent.* duty came very short of half the charges and expences which the company were at in keeping and maintaining their forts and castles. Under these difficulties, and by the extravagant rise in the prices of negroes at Anamaboe, and other places on the coast, and by the decay of the gold trade which ensued thereupon, the proprietors of the company were for many years obliged either to raise sundry great sums of money for maintaining their forts and castles, without receiving any profit from the trade, in return for the same; or to run the risque not only of losing all the money which they had from time to time raised and expended for supporting their own property, but of becoming accessaries to the entire loss of the trade of Africa, and consequently, relinquishing and abandoning their forts and castles, to be possessed by such foreign nations as were long watching for an opportunity to get them into their hands. This being the case with regard to the company, and it being the sense of the nation, that the trade to Africa should continue free and open to all his majesty's subjects, the only thing that remained to be considered was, whether or no forts and castles were necessary to be kept up and maintained for the preservation of the said trade to this kingdom; and if they were necessary for that purpose, who, upon the footing of a trade still free and open, ought in justice and reason to bear and defray the charges of them?

As there was no reason for the company's being obliged to maintain the forts and castles at their own sole cost and charge, they petitioned the parliament in 1730, and obtained 10,000 *l.* to enable them to support their forts and settlements. This sum was annually continued to them, except two or three years interruption, till another change was made in the state of this company, by an act of parliament of the year 1751. By this act the company were divested of their charter, and after the tenth of April, 1752, ceased to be a corporation, and their forts, castles, and all other their possessions in Africa were vested in a new company of merchants; and in consequence of the trade to Africa being, by virtue of the said act, and that also of the 23d. of king George II. made free and open to all his majesty's subjects, the parliament allowed this company 10,000 *l. per annum* for the support of the forts and castles for the public service. But on the 15th of May, 1765, an act of the preceding session of parliament, intituled, "An act for vesting the fort of Senegal, and its dependencies, in the company of merchants trading to Africa," was repealed, and another act then passed to vest as well the said fort and its dependencies, as all other the British forts and settlements upon the coast of Africa, lying between the port of Sallee and Cape Rouge, together with all the property, estate, and effects, of the company of merchants trading to Africa, in or upon the said forts, settlements, and their dependencies, in his majesty, king George III. and for securing, extending, and improving the trade to Africa.

The African trade, as may be known from the premises, consists of but three capital articles: *slaves, ivory, and gold*; a very beneficial and advantageous commerce, especially as it was once carried on, when these were all purchased at low rates from the negroes, and even

even those low rates paid in trifles and toys, such as knives, scissars, kettles, glass beads, and cowries, things of little value; but even this part of the trade was greatly declined in profit, since by the strife and envy among the traders, particularly between the Royal African company and the separate traders, we had the folly to instruct the negroes in the value of their own goods, and the cheapness of ours; endeavouring to supplant one another, by underselling and overbidding, by which we taught the negroes to supplant both, by holding up the price of their own productions, and running down the rates of what we carried them for sale. Thus that gainful commerce, once superior to all the trades in the world, which carried out the means of all exportations, and brought home the richest, was sinking daily, and we were sometimes said to buy even the gold too dear. But all this while there was not the least use made of the land; the fruitful soil lies waste; a vast extended country, pleasant vallies, the banks of charming rivers, spacious plains, capable of improvement and cultivation to infinite advantage, remain barren and untouched. But there are now some hopes that these advantages will be no longer neglected, by the open to a more extensive commerce that has been made for us in the late definitive treaty of peace, and particularly by the cession of Senegal.

Note. We shall give an account of the products, trade, &c. of the AFRICAN ISLANDS under their distinct or respective heads; but shall here subjoin a sketch of the commerce on the greater part of the AFRICAN COASTS, presuming the same will come in here more properly than under the article COAST. Each part, however, will be further illustrated in its alphabetical order.

Of the commerce with the coast of BARBARY.

What is called *Barbary*, is that vast maritime part of *Africa*, which extends for more than six hundred leagues from Egypt to the Straights of Gibraltar, and a little beyond them into the Atlantic ocean. The principal kingdoms, or republics, which divide the coast of *Barbary*, are Tripoly, Tunis, Algiers, Morocco, and Fez; the government of these two last are entirely monarchical, and subject to the same prince; that of Tripoly is republican; and those of Tunis and Algiers, a mixture of both. All these states have a number of ports in the Mediterranean; and the kingdoms of Morocco and Fez have also some on the ocean, which are equally serviceable for the Christians trade, and for a retreat to their own cruisers.

The most considerable of these ports, and where the greatest trade is transacted, and consuls of different nations reside, are Tripoly and Gouletta (which is that to Tunis) Algiers and Sallee, in which last the chiefest trade of Fez and Morocco is carried on, although a good deal is done at Tetuan, and some at Arzilla, Alcazar, Azamor, Saphia, and Santa Cruz. The kingdom of Algiers has, besides its capital, Tremecen, Constantine, Bona, Bugia, Gigeri, La Calla, Cape Rosa, Collo, and that called the Bastion of France, near the gulph of Storacourcouri.

And besides the Gouletta, Tunis has Bizerta and Port Farina, though the Tripolines have only the port of their city, with some few places on the coast, where none, or hardly any trade is carried on.

The European merchants have warehouses only in the principal cities, and rarely land in any others, on account of the impositions commonly practised there; trading among these people (as the saying is) pike in hand, being always on their guard; or otherwise they are surely abused or cheated.

Our exports for this trade are cloths, and other woollens, muslins, and some other India goods, spices, drugs, tobacco, sugar, dying woods, alum, paper, steel, iron, lead, toys, mercery and hardware, ivory and box combs, glass beads, &c. And our returns from thence are ostrich-feathers, indigo, gold dust, dates, damasks, raisins, copper, wax, wool, goat-skins, coral, bitter almonds, &c.

Sallee is the port in the kingdom of Fez and Morocco, of the greatest commerce; the entrance of the river Guerou, on which it is built, has a bar of sand

that changes according to the winds that blow, which is of vast inconvenience to the trading vessels, though it serves as a resource to the Saletines when pursued by the Maltese, or other Christians, who are more in safety here, than in any other port of Barbary.

The European merchandizes are unloaded immediately on their arrival, into the Christian merchants warehouses there, and afterwards sold wholesale to the Moors or Jews, who send them to their correspondents at Morocco, Fez, Mequinez, Tarudant, and Illoc. The greatest part of the merchandize imported is consumed in these five cities, particularly at Mequinez, twelve leagues from Fez, which has the largest magazines of corn, hides, and wax, the chief commodities of the growth of Morocco, and the states dependant on it. What goods remain undisposed of in the said five places, are sent to the provinces of Sara, Dras, and Touet, in the kingdom of Taflet, where the Arabians take them in truck for gold dust, indigo, ostrich-feathers, dates, and sometimes a few elephants teeth; of which last, gold, or the feathers, none are produced in the territories subject to the king of Morocco, although the Christians yearly extract from thence a great quantity of that rich dust and plumes. The gold and ivory is brought by the Arabian troops, who go to procure them as far as the kingdom of Sedan and Gago, which are part of Guinea, and are above four hundred leagues from Morocco. The ostrich-feathers come from Sara (or Dara), a country to the south of Morocco, towards the sea of sand, where the Moors and Arabians kill them in great numbers, and sometimes take them alive, and bring them to Morocco, which has led many authors and geographers into the error of supposing them natives of this empire.

The Benizequers, a people of Africa in the province of Habat in the kingdom of Fez, have among them a number of weavers and curriers, who carry on a great trade in linen and hides; and the other commodities in which they deal, are honey, wax, and cattle.

Santa Cruz, in the kingdom of Morocco, on the confines of that of Sus, near to mount Atlas, is a small town, though at present it carries on a pretty good trade, more especially to Marseilles, where imports and exports are such as are beforementioned.

Algiers, Mr. Savery says, contains above three thousand foreign families, whom trade had drawn there, though he supposes it principally arises from the sale of the prize goods, continually bringing in by their corsairs. The country produces plenty of corn, besides the other commodities peculiar to Barbary; and their imports consist of gold and silver stuffs, damasks, draperies, spices, pewter, iron, hammered-copper, lead, quicksilver, small cordage, bullets, linens, sail-cloth, cochineal, tartar, allum, rice, sugar, soap, galls from Aleppo or Smyrna, cotton in wool and thread, copperas, aloes, woods for dying, cummin, vermilion, arsenic, gum lack, anniseeds from Malta, brimstone, opium, mastick, farsaparilla, frankincense, spike, honey, wool, paper, glass beads assorted, &c. a small quantity of these merchandizes however sell here, although the natives are always wanting them, because duties must be satisfied, recoveries are difficult, a recovery of property uncertain, and imposition very frequent. Those therefore who need any of these goods, wait till the last extremity, in hopes of some prize being brought in.

Couca is a small kingdom, subject to that of Algiers; its principal trade consists of corn, olives, oil, figs, raisins, honey, and wax; here are also some iron, allum, sheep and goats for exportation.

The Bastion of France is a small fortification built at the extremity of the kingdom of Algiers, on the side where its frontiers join with those of Tunis. The French, to whom it belongs, and from whom it received its name, have been in possession of it ever since 1561, when Soliman II. made them the concession, after a previous agreement with the divan of Algiers, and the petty princes of the country, for which they pay 39,500 French livres yearly.

La Cassa is the true port to the Bastion; and besides these, the French have Cape Rosa, Bonna, and Collo in their grant, from all which places, they annually export about fifty thousand measures of wheat, eleven or

twelve thousand of barley, five to six thousand of beans, and some other pulse, above eighty thousand skins, a little suet, about five hundred quintals of wax, and much the same quantity of wool. It is likewise here that the French have their coral fishery, of which they take from five to six hundred quintals yearly; and all these commodities are sent to Marseilles, except the pulse and grain, which the Italian markets take off, and more especially Genoa.

The Bastion has been for some years past united to the French African company (or the Cape Negro company) whose exports, from the place of their denomination, are like those from the Bastion, viz. corn, hides, wool, and wax, of which in a good year their extracts are considerable.

Between these two places of the Bastion and Cape Negro, (subject to Tunis) is the isle of Tabarque, dependant on Sardinia, but has for a long time appertained to Messieurs Lommellini of Genoa, in property, who pay a sort of tribute to Algiers and Tunis, to preserve the inhabitants in the free enjoyment of the coral fishery, and do the same to the king of Sardinia, though their island is well fortified, and free from insults. It likewise carries on a tolerable good trade on its coast in corn, hides, and wax.

Of the trade of the African coast, from Cape Verd to Cape Sierra Lione.

Cape Verd, so named from the ever-green trees that cover it, is situated between the rivers of Senegal and Gambia, which are two of the chief mouths of the Niger, a river similar to the Nile, with which (as one may say) it divides all Africa; this traversing the one half, before it falls into the ocean, as the Nile does the other half, in its progress to the Mediterranean.

The trade practised in going up these two rivers, either on the coasts of Senegal, or on those which extend from Gambia to the Cape of Sierra Lione, consists in gold dust, ivory, wax, hides, ostrich and herons feathers, musk, rice, millet, indigo, and cotton coverings for the negroes.

The Portuguese have had great settlements on all these coasts; but at present their habitations are something more inland, especially going up the river of St. Domingo (which is about thirty leagues from that of Gambia) where their residence is at Caches, the place where the African company of Lisbon have their magazines, and those they collect of the country's produce, brought down the said river (which is navigable for above two hundred leagues) being annually about 100,000 lb. of wax, 50,000 of ivory, and from 800 to 1000 negroes, which they send to the islands of St. James and the Brazils, besides those they sell to the English and Dutch, which come here yearly to seek them.

The Portuguese here carry on their commerce in barks of about forty tons burthen, with which they trade up the rivers Cazuma, Pongues, Nonnes, and even to that of Sierra Lione; the first furnishing them with their greatest quantities of wax; Pongues and Nonnes with indigo; and Sierra Lione with fruit, which they call Coffe, with which they drive a great trade; and from all these places they also get a quantity of ivory and slaves, which they truck against the aforementioned negroes clothing, brandy, iron, pewter, &c.

The English had formerly many habitations, and some forts on the river Gambia: that called St. James, belonging to their South-sea company, situated a little higher than its mouth, was taken and destroyed by the French in 1695.

The river Gambia has two openings, the one to the north and the other to the south; in which latter (being most used) ships of three or four hundred tons may enter, but cannot go up it above six or seven leagues; though vessels of a hundred and fifty tons may go up as many leagues to Majugard; and the English, with lighter barks, have often proceeded yet a hundred and fifty leagues higher, from whence they have brought back a quantity of slaves, gold, and ivory, in time of peace, to Majugard, where they had a magazine, and their fort with their principal habitation was in an isle of the river, about seven leagues from its mouth.

Cantory is a kingdom of Africa, in Negroland, on whose coasts the French have a tolerable good trade, and a fort for its security and protection. The principal traffic is in skins and hides, for which duties are paid at Bey-houta.

Calbaria is a province in Africa, where the Dutch have a considerable trade, chiefly carried on at the town of that name, their fort being there, and their traffick in slaves a good one, though the greatest part of the natives on this coast are reckoned Cannibals. The exchange for slaves is unpolished copper, or small bars of hammered brass, each weighing a pound and a quarter, and about two feet and a half long, of which fourteen or fifteen are commonly given for slaves of both sexes, and different ages, one with another; of these the natives make a sort of lattice wire, which they employ in collars and bracelets to adorn themselves; and in case any of these latter are carried ready-made from Europe, they use them there as money.

SENEGAL.

The French company of Senegal, united to that of the West in 1718, and after the year 1719 swallowed up in the great India one, had before the late war two principal establishments on this coast; the one at the isle of Goree, which was taken from them in the course of the war 1758, by Commodore, now Admiral Keppel, but restored to them by the definitive treaty of peace of Fountainbleau; and the other in the isle of St. Lewis, at the mouth of Senegal river, which was also taken the same year, but by the same peace was ceded to the English with its dependencies. The Dutch were the first who occupied the island of Goree, and built there the forts of St. Francis and St. Michael, though under their first masters they had other names. The French seized it in 1678; in 1692 the English took it from the French, who the succeeding year again repossessed it; and the Senegal company occupied it ever since, till the late war, and from hence carried on a part of their trade, of which, however, the greatest share always continued to be transacted on the coast of St. Lewis isle, and that of the river Senegal.

All that this company could negotiate, in the whole of these settlements (Senegal included) might amount in a common year to six thousand bull and ox hides, forty or fifty quintals of gum senega or arabic, from a hundred and fifty to a hundred and sixty quintals of yellow wax, seven or eight thousand pounds of elephants teeth, two thousand cotton negro vestments, twenty-five or thirty marks of gold, and fifteen thousand slaves. It also extracted some ostrich and herons feathers, ambergrace, civet, a quantity of coarse cotton cloth, blue and white striped, which were re-sold on the gold coast. The chief traffic of gum is with the Moors, who bring it on horses to a place called Terrier Rouge, at fifty leagues from the coast, going by the river of Senegal; of which the sales begin in the month of April, and last about six weeks.

Higher up on the coast is found the kingdom of the Jalofes, and that of the Ceratique; and it is to this last that the customs were paid, for the liberty to navigate and trade in the river of Senegal.

The English and Dutch have very considerable dealings with these Jalofes; and the places of their principal transactions are Camino, Jamefil, and Geroep. The months of March and April, with those of November and December, are the most convenient for this commerce.

The merchandizes proper for Senegal and Gambia are in part the same, and part different. Those for the river of Gambia, particularly for the Jalofes, with which the Dutch commonly load their vessels for this traffick, are bars of iron (twenty-eight or thirty to weigh about ten quintals) brandy, beer, copper basons of different weight, copper plates of about a pound, yarn, coarse narrow blue serges, four threaded cloths, red, yellow, and blue ratines, red, yellow, and white combed wool, white, blue, red and yellow, glass beads of various sorts, rough coral, fabres, copper trumpets, red caps, round padlocks, rock crystal, sailors knives, coarse shirts, and fine ones with lace at the bosoms and wrists, suits of cloaths

1 Hour East from London.

1 Hour West from London.

cloaths from Harleam, Silesia linens, and others both of hemp and flax, fine cotton linen, fine and common paper, earthen pots white and blue, blankets of Leyden, Irish mantles, Morocco leather shoes, hats, brown fustian, coarse white thread, glass bottles, with pewter stoppers, and all sorts of needles.

The loadings of the French ships for Senegal were in part composed of the aforesaid goods; and besides them, of black cotton linens, calendered linens of Rouen, kettles from four to ten pounds weight; some few trinkets of silver, yellow amber, pewter, little looking-glasses with painted frames, some coin, large red coral, taffeties, crimson, cherry colour, yellow and blue, though but few of them, a few cloves, sambouc wood, and the Iris of Florence, for presents to the negroe kings, as also a few ells of scarlet cloth for the same purpose.

Arms, such as musquets, musquetoons, fowling-pieces, pistols, double-barrelled guns, gun-powder, leaden balls, shot, and flints, are equally proper for Gambia and Senegal; but one of the best merchandizes, and of which the sales are the most considerable, are the Maldivian shells, called couris in India, and bouges on the coast of Afric.

All these merchandize, and some others, which will be hereafter mentioned, are equally proper for the trade of all the other African coasts, excepting the above-mentioned shells, which are only current from Cape Blanco, to and including Juda (or Xavies) on this side the river Ardres. But Angola, where the greatest purchase of negroes for America is made, does not admit these shells in trade. It is true, that the inhabitants of Congo do also make use of shells, by them called Zimbi, or Zinibi; but these are carried them only by the Portuguese, who are in a manner masters of all this great kingdom.

The commerce of the African coasts, from the Cape of Sierra Liona, to the river of Ardres.

It is from the river of Sierra Liona, that the coasts of Malaguetta begin, so called from a sort of pepper, that makes the principal trade of the Blacks of this part of Afric; the English and Portuguese share this traffick; the first having a factory conveniently established in one of the islands, and the other within land.

The merchandizes this country affords them, are rice, elephants teeth, (the best on all the coasts) civet, and a little ambergrease. The capes of Moute, and Miserado, would likewise be good places for the ivory trade, could the inhabitants be made tractable, as the river Junco (or del Punto) would, did not the sea break in such a manner, as to render anchoring there very dangerous.

The ivory coast joins to the preceding, and produces only those teeth, and a little gold for trade. Iron rings and small bells are what most pleases these Barbarians, from Europe; and the places of the greatest trade on this coast, are the Grand Drouin, situated in an isle formed by a small river; Growa, Tabou, Little Tabou, Tao, Rio Fresco, St. Andrew, Giron, Little Drouin, Bortrou, Cape la Hou, James la Hou, Wallochk, and Gammo.

The Gold Coast begins at the river Sueiro da Costas, and is about a hundred and thirty leagues long east and west. This coast is above all others of Afric the most frequented by the Europeans, and where the English, Dutch, and Danes have very considerable settlements: the great quantity of gold found, and sold on this coast, has given it its name, and its chief market-places are, Atchim, or Axime, Acara, called also Tason, Acanni, Acherva, and Fetu. That of Axime is the best, and of the standard of twenty-two or twenty-three carats. For the trade of Abasson on this coast, *see the article* ABASSON.

The kingdom of Guimere is the nearest to Cape Apollonia, and though its sea coast be very contracted, it is pretty considerable within land, and drives a great trade, either from gold mines it has itself, or with what it collects by its commerce, with those that possess them, as this metal is very common here; and the traffic in ivory and slaves is not a little. At eight leagues to the east of Cape St. Apollina, is the village which the ne-

groes call Akxen, the French Axime, and the Dutch Atchim, of which these last have been far above a hundred years masters.

After Axime, is Cape des Trois Pointes, called so from three mountains which compose it. The subjects of the king of Prussia were settled here, and had a fort, which they had obtained in 1720, and delivered up to the negroe king, master of the country, who acquainted the French therewith, and solicited their coming to settle there, with offers of an exclusive trade; but they neglecting to improve the opportunity, the Dutch took it in 1725, and continue to enjoy it. It is one of the most considerable places on the coast; the anchorage is good, the landing easy, without any bar; and the country is healthy, abundant, fertile, and well cultivated. Besides the gold trade, which is very considerable, here is a great deal of ivory, and many slaves. The Dutch have another fort called Botrou, about two leagues to the eastward of the cape; and another at six leagues to the east of Botrou, named Witsen, pretty near to Tacoravi.

Sama, or Chama, is one of the chiefest places on the Gold Coast, being near four leagues east of Tacoravi; it contains about two hundred houses, and the Portuguese had here formerly a factory, and a redoubt; but the Dutch seized both the one and the other, and carry on a considerable trade here, it being the rendezvous of all the neighbouring negroes.

The kingdom of Gnaffo, or Commendo, begins four leagues to the east of Sama. This with Fefu (or Fetu) and Sabou, made formerly but one kingdom, and was then powerful and rich, but since its division is greatly diminished. The negroes call it Commendo Ajata, and the Portuguese, Aldea de Torres, though it is yet known under the name of Little Commendo, to distinguish it from Gnaffo, which is further in land, and denominated Great Commendo. All this country is extremely fertile, and abounds in every thing necessary for life. At Little Commendo is a celebrated market kept daily, the best furnished of any one in Guinea, and perhaps in all Afric.

Although the gold trade is not so considerable here, as the places before mentioned, and at the Mine, &c. which I shall hereafter speak of; yet the French have notwithstanding made a settlement, which is of infinite service to them, for furnishing their ships with refreshments in their voyages to the East, and in their return to France.

The castle of the Mine, known by the name of St. George de la Mina, is the principal factory, and the best fortress which the Dutch have on the Gold Coast, being the residence of their director, and general commandant, and the center of their commerce, on which all their other settlements depend. The soil is infertile, and therefore the miners are obliged to the Blacks of Commendo, Fetu, and Cape Corfe, for their provisions; which last place lies about three or four leagues from the Mine, and has for some years past been the chief settlement of the English in those parts; it was the residence of the director-general of the London company, who had authority over all the settlements which this nation has in Guinea; and the fortifications are here so strong, as to have resisted the Dutch fleet, under the command of Admiral Ruyter. The village occupied by the negroes is the most considerable of the kingdom of Fetu; it is composed of more than two hundred houses, and has a diurnal market, where every thing may be had for money that a person can wish for.

By the agreement which the English and Danes made on their joint capture of this place from the Dutch, it was stipulated that the Danes should have a fortified settlement here, called by them Fredericksbourg, which is to the north-east of the village, and is commanded by the principal commissary of the Danish company, which carries on a considerable trade here.

Although the fort and village of Cape Corfe are in part dry and arid, the rest of the kingdom is very fertile and abundant, the lands are well cultivated, and the natives (who are numerous) are very laborious.

The village of Moure is a short league from Fredericksbourg, where the Dutch have a fort by the name of Nassau.

The kingdom of Fantin is extremely rich, populous, and potent; the greatest village in Cormantin, about three leagues from Moure; the English had formerly a fort here taken and retaken by the Dutch, with whom at last it remained, and they have here a good trade, as they have at Adia and Jamolia, which they have fortified. The country is rich in gold, the inhabitants laborious, lovers of trade, of which they have learned the secret and œconomy from the Dutch. *For the trade of ACKRAM or ACRON on this coast, as also of ACARA, see those articles.*

Of the trade on the coast of the kingdom of BENIN.

The Europeans trade but little in this kingdom, although it has two hundred and fifty leagues of coast, and the inhabitants are less savage than the negroes of Guinea and other parts of Afric. The merchandizes found here are cotton habits striped, according to their fashion, (afterwards sold on the Gold Coast) and others blue, proper for the trade of the river Gabou, and the coast of Angola; jasper stones, female slaves (for they will sell no men;) leopard-skins, pepper, and acori, which is a species of blue coral that grows under-water in the form and manner that other corals do. *See ACORI.* In exchange of these commodities are given gold and silver stuffs, red and scarlet cloths; red velvets, violet coloured ferrets, Harlem flowered stuffs well gummed, red glass ear-rings, looking-glasses with gilt frames; glass beads, bouges, fine coral, earthen drinking pots striped with red, all sorts of cotton thread, and linen, oranges, lemons, and other green fruits candied, brass bracelets weighing five ounces and an half, lavender, and iron bars.

The Dutch are almost the only traders with these people, and are the only among all the Europeans that have a warehouse here, which by the king's permission is established at Golou, a large village on the river of Benin; and this commerce they enjoy uninterruptedly, because the country produces neither gold, ivory, hides, gum, wax, nor slaves, as abovementioned, though the natives are much more civilized, honest, and (if the expression may be allowed) polite than any of their neighbours.

Captain Snelgrave, in his *Treatise of Guinea*, published in 1734, says, that the river Congo, in the sixth degree of southern latitude, is the most distant part that the English trade to, whose commerce here is so greatly augmented since the peace of Utrecht, that instead of thirty-three ships under those colours, that in 1712 were on the coast of Guinea; it was demonstrated to the commissioners of trade, that in 1725 there were above two hundred sail, to the great advantage of navigation and our American colonies.

Our author recounts the ruin of the kingdom of Whidaw, (Fida or Juda) of which Sabee is the capital, situated about seven leagues from the sea; and here the king had granted to the Europeans commodious houses for their factories, protecting both their goods and persons. This port was open and free to all European nations, who came here to purchase slaves; and this trade was so considerable, that the English, French, Dutch, and Portuguese exported above twenty thousand yearly from this kingdom and its neighbourhood; but the liberties which the natives enjoyed of having many women, and their abandoning themselves to luxury and pleasure, so effeminated them, that although they could bring above an hundred thousand men into the field, their cowardice was so great as to suffer two hundred enemies to drive them from their capital, and to see uninterruptedly their whole country destroyed by a nation, which they had formerly despised.

Of CONGO.

The Portuguese, who discovered this kingdom in 1484, and settled here in 1491, are the only Europeans that trade here; all other nations stopping only for refreshments, which they purchase of the Blacks, in exchange for small looking-glasses, beads, &c. The principal settlement of the Portuguese is at Loanda, the residence of the vice-roy, and, as may be said, the capital of what the Whites possess in this kingdom; the port is

vastly large, and the anchorage secure; and this is the place where all the ships arrive and sail from, either for Europe or the Brazils.

The slave-trade is the most important the Portuguese have at Congo, and the number which they send yearly to the support of their American colonies is surprizingly great. What renders this business still more advantageous and considerable, is the short cut from hence to the Brazils, compared with what all other nations have to run, when they carry these unhappy wretches to their plantations. The Portuguese seldom exceed a month or five weeks in their passage, and consequently in this short time are not exposed to such a loss by mortality among their slaves, as others are, who have a much longer voyage to make, which frequently occasions distempers that sometimes carry off the greatest part of them.

It is difficult to ascertain the number of slaves which the Portuguese residing at Loanda, Colombo, St. Salvador, and all other places in this part of Afric have in property. Those who are least rich, having fifty, an hundred, or two hundred belonging to them, and many of the most considerable, possess at least three thousand; a religious society at Loanda, have of their own twelve thousand of all nations, which being blacksmiths, joiners, turners, stone-cutters, &c. do almost all bring their masters in from four to five hundred rees per day gain, which they procure by working for the public.

Besides the Blacks, Congo produces ivory, wax, honey and civet, and has in it some mines of iron and copper, though of these no great quantity is extracted. St. Salvador is properly the rendezvous of all the Portuguese merchants; where they bring gold and silver stuffs, velvets, English cloth, gold lace, black ratine, small English carpets, copper basons, blue earthen pitchers, hats, rings, coral, fire-arms, and shells called here zimbi, or zinibis, which serve for small money; besides all which, brandy and wine find here a current and good dispatch.

Of ANGOLA.

Angola is of all the African coasts that which furnishes the Europeans with the best negroes, and commonly in the greatest number, although it scarce extends twenty-five to thirty leagues along the sea shore; it is true, this kingdom widens considerably within land, being at least an hundred and fifty leagues in length, and as much in breadth, whose capital is Loando St. Paolo.

Although the Portuguese are extremely powerful in the interior part of the kingdom; and though the majority of the negroes in the provinces they have subdued, may properly be termed the vassals of his most faithful majesty, to whom they yearly pay a tribute of slaves, yet the negroe trade, which is transacted on the coast, has always remained free to the other nations of Europe; and the English, French, and Dutch send yearly a great number of vessels, which carry off many thousands of those poor unhappy creatures, for the supply of the American settlements, or for sale in those of the Spaniards.

The Portuguese are however those which deal the most here; and it is astonishing that they have not before now depopulated the country, there being hardly any year, that they do not ship off fifteen thousand for Brazil. The villages of Cambambe, Embaco, and Massingomo, are those which furnish most slaves to the Portuguese merchants concerned in this traffic.

And the merchandize with which they pay for them, are cloth with great lists, crimson silk stuffs, linens, velvets, gold and silver lace, black serges, Turkey carpets, white and coloured threads, sewing silks, Canary wine, brandy, olive oil, sailors knives, spices, refined sugar, great hooks, pins three inches long, and others of various sizes, needles, &c.

The Portuguese have also a settlement at Binguella, a small kingdom dependant on that of Angola, where they carry on some trade; but this place is unwholesome, and fitter for the abode of criminals banished by the tribunal at Lisbon, than for the residence of persons exercising trade.

Of LOANGO, MALIMBO, and CABINDO.

The negro trade that is carried on in these three places of the Angolan coast, is not one of the least considerable that the English and Dutch are concerned in, on the shores of this part of Africa, whether for the number, goodness, or strength of the slaves, for which the Europeans prefer them to all others; or whether because the inhabitants of the American colonies always give for them a higher price, as more able to sustain the labour and fatigues of the culture and manufacturing of sugar, tobacco, indigo, and other painful works, in which it is customary to employ these miserable persons.

The merchandize proper for these parts is the same as has been already mentioned, so we shall only add a remark made by the judicious in this commerce; that as soon as the business is concluded, and the slaves aboard, not a moment should be lost in getting to sea, for fear the unhappy captives should grieve at the sight of their country, from which they are now banished.

Of the trade of the AFRICAN coasts from the CAPE OF GOOD HOPE, to the entrance of the RED SEA.

The Portuguese discovered the Cape of Good Hope in 1493; but they remained undetermined to settle here, either through a want of courage or defect of prudence, or by a reflection on the cruelty with which they treated the poor Hottentots, in revenge of their being at first not well received by them. It does not appear that from that time the Europeans made any descent there till 1600, when the ships of the Dutch East-India company began to touch here, though they did not at first comprehend all the advantage they might draw from an establishment in this country, and therefore contented themselves for some years, to anchor here, going and coming, only to buy fresh provisions; and in order to secure these from any insult till re-imbarking, they built a small fort upon the harbour, whose ruins were discernable not long ago. But on the company's ships stopping here as usual in 1650, one Mr. Van Reibeeck, then a surgeon, soon perceived by the situation and goodness of the country, of what advantage the establishment of a factory here would be to the company's trade, and on his return to Holland, he communicated his thoughts to the directors, who so far approved them, as to resolve on attempting the thing, without loss of time; and accordingly they charged him with the care of the expedition, and gave him four large ships with all materials, instruments, workmen, &c. necessary for the undertaking: they made him admiral of this little fleet, and governor of the Cape, with full power, on arrival, to treat with the natives, and to regulate every thing that he should judge would be conducive to the establishment of the intended colony, on a secure and lasting foundation. Van Reibeeck had all the success that he could possibly desire in this enterprise; as he knew so well how to ingratiate himself with the Hottentots, by the presents he made them of some hardware, he presently concluded a treaty with them, by which they granted the Dutch full liberty to settle in their country, and to trade with them as they should think proper, on payment of fifty guilders, in the same sort of merchandize as their presents were. This treaty was immediately executed with punctuality on both parties; and from that time the India company have enjoyed an uninterrupted settlement, and nothing is neglected to render it as beneficial as possible.

When I say their establishment has been without interruption, I mean from the contracting parties; for as soon as the Dutch began to cultivate their new purchased lands, and to build houses and forts, the Gumboes (who are a nation at the Cape nearest the sea) opposed themselves to this establishment, and called in all the neighbouring nations to their assistance; but the Dutch defended themselves so well, that their enemies were obliged to demand peace, which was granted them on the following conditions, viz. The first agreement was not only confirmed, but it was farther stipulated that all the lands, which the natives did not then actually occupy, should thenceforward belong to the Hollanders, with this clause only, that the natives might

settle wherever they pleased, provided it was in places that the Dutch left uncultivated. An alliance offensive and defensive was at the same time concluded, which though not down in writing (the Hottentots not understanding the use of letters,) has been hitherto religiously observed. By this treaty, the Dutch are in a manner become the masters of all this country; and the chiefs of the nations frequently come to renew the alliance with the governor, and to bring him presents of cattle, where they are always well received, and their gifts returned in tobacco, brandy, coral, and other things they are known to be fond of.

It has cost the company immense sums to put this establishment on the footing it at present is in; Mr. Kolben computes the expence of the first twenty years to have been at least a million of guilders *per annum*; and that during the time he was there, it was difficult to raise enough to defray charges. The revenues consist in the tithes of all the lands which the Europeans possess at the Cape, ground-rents, customs on all foreign wines, and those of their own growth, on tobacco, beer, brandy, and other distilled liquors, as well as on the profits made by trade, which the aforesaid Mr. Kolben reckons annually to amount to 225,000 guilders. But as the colony has always gone encreasing, and fresh lands continually been grubbing up, this establishment has become very beneficial in time.

The territories which the Dutch possess are divided into four districts, of which the first is called the Cape, because it is the nearest to the sea, and the city and fort of Good Hope are built here.

The second colony is that of Stellenbosch, so called from Stel, the name of a governor (Simon Vander Stel) under whom the establishment was made, and Bosch, which in Dutch signifies a wood, because the country was entirely covered with it, or over-run with weeds, when the Dutch took possession: this colony is separated from the first by sands, of a great extent, and divided into four parts, of which the two principal ones are, that which still retains the name of Stellenbosch, and that called Hottentot Holland, not because it resembles the province of Holland, which is much less, and very differently situated, but because it appeared to the first settlers to be the fittest for the cattle appertaining to the Indian company.

Drakenstein is the name of the third colony, which was begun settling in 1675; a great number of French protestants, having a little before fled for refuge to Holland, the company, by recommendation of the States-general, sent many with their families to this country, with orders to the governor to give them lands, and all necessaries for their culture: it is these or their descendants, which at this time compose the greatest part of the inhabitants of Drakenstein; and although they have omitted nothing that might render this settlement flourishing, and herein have been assisted by the soil, which in general is very good, yet few have obtained a sufficiency to make themselves easy, but generally speaking are poor, living from hand to mouth, and in huts like the Hottentots. This seems surprizing; but our author attributes it to the little support afforded them, as there was room to have expected more.

The country is mountainous and stony, yet nevertheless very fertile, producing almost every thing growing in the other colonies; the honey-mountains are here among others so called from the great quantity of that sweet liquid, which a meridian sun forces in drops from the cliffs of the rock, and which the Hottentots acquire at the peril of their lives. The governor Vander Stel gave this colony the name it bears, in honour of Monsieur Baron Van Rheede, lord of Drakenstein in Guelderland, who in 1685, was sent by the India company, in quality of commissary-general, to examine the state of all their factories and plantations, and to redress as he should think proper the abuses crept in there.

The last and youngest colony of the Cape is that of Waveren, which received this name from William Vanderstel, in honour of the family of Van Waveren of Amsterdam, to which he was allied. It was before called the Red Sand, on account of a mountain which separates it from the colony of Drakenstein, on the top of which,

which, and about it, is found a great quantity of this red sand. The country is naturally very fertile, but little cultivated, as the inhabitants possess nothing here in property, but are obliged to renew their leases every six months with the governor.

There is not a country in the world, according to Mr. Kolben, that feeds so great a quantity of large and small cattle, as the Cape of Good Hope, where they are cheaper, and their flesh better; an ox commonly weighs here between five and six hundred pounds, which is given for a pound of tobacco; and a sheep's tail weighs from fifteen to twenty, and sometimes thirty pounds.

As lazy as the Hottentots naturally are, they do not however neglect an application to the mechanic arts, and they are even so expert, that it is inconceivable how they should be accused of being a people the most ignorant and stupid in the world. They have furriers and tanners by profession among them, who understand preparing the skins with which they cover themselves, and the hides that they employ in divers uses, almost as well as the Europeans; artificers in ivory, who, without any other instrument than a knife, work in it with as much propriety and delicacy as the best tanners; mat-makers; rope-makers, who have the art to make cords with small rushes, that are as strong and durable as hempen ones; and blacksmiths, who very well understand to cast iron, and give it all sorts of forms, with flints only, although they hardly ever make any other use of it, than to arm their sticks, arrows, javelins, and other similar instruments. These blacksmiths work also in copper, though but a little; for all their performances herein are reduced to some toys, with which the men and women adorn themselves; and they are all in general potters, every family making their own vessels, for which they use the earth of an ant-hill, which they carefully cleanse, and afterwards knead with ant-eggs, which makes an admirable cement, and gives to the matter a jet black, which it never loses. It is hereby seen, that they neither want invention nor dexterity, and that if they were less slothful, they would in the mechanic arts soon equal all the other Africans.

Of SOFALA and MONOMOTAPA.

The kingdom of Sofala is rich in gold mines and ivory, and these two precious commodities attract foreigners, and maintain commerce. The Arabians are supposed by some, and the fleets of Solomon and Hiram king of Tyre by others, to have been the first traders to these parts.

The Portuguese settled here towards the end of the fifteenth century, and in 1500 even obtained permission to build a fort pretty near the capital, for the habitation of their factors carrying on their chief trade here, for which it was commodiously situated on the Quama's shore, where they had their warehouse for European merchandize sent them from Mosambique.

The richest mines of the kingdom are those of Sofala, from which there is yearly extracted (if the negroes may be credited) more than two millions of mericals, which at fourteen livres Tournois (as Mr. Savary computes them) make twenty-eight millions of livres: these riches are divided between the Portuguese (who are the only Europeans that trade to this kingdom) the Arabians (more especially those of Ziden and Mecca) and the Mahometans of Quilloa, Monbafé, and Melinda. These latter come in small barks, which they call Zambucks, and bring blue and white cottons, silks, ambergrease, and fuccinum, or yellow and red amber variously carved.

The commerce of the Arabians may import above 140,000 l. sterling *per annum*, in exchanging divers sorts of goods they bring from the East-Indies, and the Red Sea, against gold and ivory.

In regard to the Portuguese trade, it is carried on by those of this nation settled at Mosambique, who send here the products of Europe, proper for this market, on which they make so vast a profit, that the governor's duties only amount yearly to between 60 and 70,000 l. sterling, *extra* of the Portuguese troops pay, which comes out of this trade, and besides the tribute annual-

ly sent to the king of Portugal, which is very considerable.

The smallest share of these merchandizes are, however, consumed in this kingdom, the rest passes to Monomotapa, where the Sofalese truck them against gold, which is given them unweighed; (these people never using scale) and making, as one may say, an arbitrary traffic, dependant on the caprice of the buyer and seller.

The kingdom of Monomotapa being within land, and none of its provinces near the sea, strangers, and more especially the Europeans, carry on no direct trade with it; it is true, the Portuguese have some settlements here, but religion has been a greater motive to their origin than trade; so that all the gold, ivory, and ostrich-feathers (which are the principal commodities that this vast tract of Africa furnishes to commerce) pass, as before observed, through the hands of the Sofalese. The gold of Monomotapa is of two sorts, the one from the mines, and the other found in the gravel of the rivers; and from both the quantity collected annually is found so great, and the merchants of Sofala have so rich a business here in truck for Asiatic and European goods (which come from the Arabians and Portuguese) that these latter commonly call the prince to whom Monomotapa is subject, the golden emperor.

Of MOSAMBIQUE.

The Portuguese are the only Europeans, who have any establishment, or carry on any trade in the kingdom of Mosambique; the Arabians, however, share with them, although the former use all possible means to hinder their progress, and secure it entirely to themselves. The Portuguese habitations along the coast are considerable, and all defended by good fortifications, or at least, by strong houses, which serve for magazines and a security against the natives, who are equally perfidious and lazy; but the center of their commerce in these parts is the isle of Mosambique, about two miles from the continent, in which they have a commodious town, well fortified, which is the common residence of the governor-general, and that of the richest merchants.

This isle and its port are to the Portuguese India shipping, what Madagascar formerly was to the French, and what St. Helena and the Cape of Good Hope are at present to the English and Dutch, *viz.* a place for depositing goods, and affording refreshments.

The Dutch twice attempted to make themselves masters of the commerce of Mosambique, in the beginning of the seventeenth century; the first in 1604, and the second in 1607; but the Portuguese, then united with the Spaniards, made so brave a defence, that the Dutch fleets were obliged to return half ruined, though with a rich booty they found in several Portuguese caracks which they took.

The trade carried on here consists of gold and silver, ebony, (of which their forests are full) ivory (found here in greater abundance than in any part of Africa) slaves taken in war, mats, and all sorts of refreshments; and the merchandize given in exchange, are wine, oil, silk, woollen and cotton-stuffs, coral, wrought and unwrought.

When the European goods arrive at Mosambique in the Portuguese ships, they are taxed at a certain price by the king's factor, who afterwards sends them to Chilimani, at the mouth of the Senna, from whence they go up the river in small barks, to a little Portuguese town seated at the height of the Senna, where the Caffres and Blacks come from the inland kingdoms and provinces of Afric, sometimes at three or four months travel distance, to buy or take on credit the Portuguese goods, for a quantity of gold agreed on, and which they never fail to bring faithfully.

This traffick generally yields cent. per cent. and is properly the Chili and Peru of the Portuguese; gold being so common here, that at a month's journey from the coast, the utensils of the house and kitchen are customarily made of it.

The commerce of this coast, which is the last kingdom from the Cape of Good Hope, to the entrance of the Red Sea, where the European ships anchor to trade, is almost entirely in the hands of the Portuguese, who have a great settlement in the capital, and have even had the credit of building seventeen churches here, although the king is a Mahometan. The natives, however, carry on some trade with their own vessels, in the Red Sea, and with them frequent the best ports in Arabia.

They are also sometimes seen in the Indian sea, particularly at Cambaya, a maritime town in the territories of the Great Mogul; but with all this, and though the Indians and Arabians sometimes bring them goods to Melinda, it is properly by the hands of the Portuguese that all this trade is transacted, which is but little less considerable than that of Mosambique.

The gold brought from Sofala, the ivory, copper, quicksilver, all sorts of silks and cottons of Europe and the Indies, various printed linens, especially Cambayan handkerchiefs, spicery, rice, and other pulse and fruits, are the principal commodities brought to Melinda.

AFSLAGERS, a name given at Amsterdam to those appointed by the burghmasters for presiding at public sales in that city. They are much in the nature of our auctioneers, and are accompanied with a clerk to keep an account of what is sold. They are also frequently called *Vendu Meester* or *Salesmen*.

AFTER-MATH, in husbandry, signifies the second grass, or that which springs up after mowing.

AGALLOCOM, wood of aloes of the shops. C B. This wood is brought from the East-Indies, and is one of the species of the aloes-wood, sold by the druggists. It is odoriferous, variegated with different colours, and acrimonious to the taste. Its substance being very compact, makes it hard to burn; but when it catches fire, abundance of sap runs from it, which is believed among the French to be a sovereign remedy for the diseases of the heart, so that it is reckoned by them among the best cardiacs. Its bark is so thin and pliable, that it may rather be called a skin. See **ALOES**.

AGARIC, the fungus of the larch-tree. This fungus is an irregular, spongy substance, extremely light, very friable, and of a snowy whiteness, except the cortical part, which is of a brownish colour, and is usually taken off before the *agaric* is brought to the shops. The best sort is that just now described; but there is an inferior kind of a bad colour, full of red fibres or veins, and which upon cutting proves hard and gritty. *Agaric* upon first tasting is sweetish, but soon proves bitter, acrid, and very nauseous. M. Boulduc *Mem.* of the French R. Acad. of Sciences for the year 1714, obtained from this drug, by means of spirit of wine, a tincture of an extremely disagreeable and nauseous taste; one drop of which being put on the tongue occasioned vomiting, and left behind it a distrelish for all kind of food, &c. for a whole day. Two ounces of *agaric* yielded to spirit six drams and a half of a resinous extract; but on treating it with water, no solid extract was obtained. This drug was formerly of great esteem in medicine; but the present practice has almost rejected its use, on account of the manifest inconveniencies which attend its exhibition. Nevertheless, M. Boulduc says, that an extract of it, made with water acuated with salt of tartar, is an effectual and safe purge.

The different sorts of funguses growing on other trees, may be also reputed to many kinds of *agaric*, and in regard to these some very useful discoveries of their properties have been made within these few years by the French Academicians. (See their *Memoirs for the year 1762*.) M. Montet, of the Royal Society of Sciences at Montpellier, observed, in a journey he took to the mountains of Esperou and Algoual, that all the funguses of the species of those that are called *fungus maximus pedis equini speciei*, which grow on the birch-trees these mountains abound with, grew principally on the trunks of those trees that had been cut down, and which the wood-fellers leave sometimes standing to the height of four or five feet; he observed also that they only grew on such of those trunks as be-

gan to rot, and, if any were found upon intire and live trees, it was never but upon some part of the tree that was already perished. The inhabitants of Esperou assured him that, before perceiving those champignons on the trunks of the dead tree, they saw a great quantity of water flow from them. The internal part of these funguses serves for making tinder, and is also used in preparing that matter which stops blood, according to M. Brossard; so that it is not true that the champignons which grow on oak are the only which should be used for this purpose. M. Montet employed successfully those that grow on birch; and perhaps also those that grow on other sorts of wood are equally proper. But, if any of these cannot be had, this useful remedy may be still procured from the powder contained in the lycoperdon, or puff-ball, a kind of wild champignon, according to M. de la Fosse's observations, which had been verified in presence of persons deputed from the Academy to examine into its effects. The result of M. de la Fosse's experiments was, that the application of this powder, without any ligature, stopped in a few minutes the blood of the largest arteries of a horse, which had been cut designedly; and the animals used for these experiments, having been killed a few days after, it appeared upon dissection, that there was formed at the end of each cut artery, a stopple adhering to the substance even of the artery, and capable of resisting the efforts of the blood, though they might be more considerable than usual. The application of this remedy will be a fortunate resource in cases, wherein the opening of arteries might occasion a dangerous bleeding.

AGATE, a precious stone, takes its name from a river of Sicily, called *Achates*, where it was first found. It is various not only in colours, but in the very images of things, which it represents, not done by the hand of the painter, but by nature herself. For the veins and spots run in and out, and intermingle in such a manner, that sometimes you see the figure of a dove, and then it is called *Phaëachates*: sometimes that of a horn, whence it is named *Kerachates*; sometimes a tree appears, or perhaps two, or more, like a little wood, which gives it the title of *Dendrachates*. In others of these stones you see the resemblances of chariots, rivers, several sorts of birds, and cattle, and men amongst the rest. Pyrrhus, king of Epyrus, had an *agate*, in which were represented the Nine Muses, and Apollo holding his harp, not the work of art, but drawn by nature, the spots, according to Pliny, being so happily interspersed, that each of the nine had her proper symbol. India abounds with this sort of *agate*. They are of a black, dark, or ash-colour, or like that of coral, or the skin of a hyena, lion, or panther: the latter they call *pardalion*, the other *leontion*, and *leontideiran*. These colours, especially the first, are sometimes striped with veins of white, and then the stone is called *leucachates*; sometimes with those of a blood colour, and then it is named *haimachates*; or with red, like the sarda or cornelian stone, and then it is termed a *sardachates*.

The *agate* is used in making cups, rings, seals, handles for knives and forks, hilts for swords and hangers, beads to pray with, smelling-boxes, patch-boxes, snuff-boxes, salt-fellars, little mortars, and abundance of toys. It is also used for the construction of some tabernacles in Romish countries to contain the host, and of cabinets and tables inlaid with other precious stones; being itself a kind of stone that is cut, sawed, polished, and carved, with no great difficulty. Much of it is brought from Strasburgh entirely manufactured; but this kind is far from being so hard, or of so fine a polish, as the right oriental.

The ancient river Achates in Sicily, near which were found the first quarries of these precious stones, is not one of the least sources of the riches of that country.

The lapidaries pretend that the *agates* of the Indies are finer than those of Sicily. "I own, says F. Labat, that one may meet with some that are finer than others, and also, that, to make them the dearer, the dealers never fail to pretend that they come from remote parts. It is their common rule; though one part of the same piece may be much finer than another. Their prudent avidity does not permit them to say that they are of the same country,

the same quarry, the same block; but in order to sell them dearer, they make them come from the East-Indies; and, if you are desired to observe the difference between two parts, or pieces, they are far from telling you that they are of the same block; they make them grow 1000 leagues from each other, in order to enhance excessively the price of those to which nature has given most variety and beauty. In former times people set more value upon them than they do at present. Whether the cost has deterred the curious, or these stones are no longer in fashion, as they once were, it is certain that so many of them are not used as formerly. I have seen cases of considerable magnitude and extraordinary workmanship, in some cabinets and repositories of churches, in which the shades and variety of colours had been so dexterously managed, that the pencil could not have succeeded better. *Voyage de l'Italie du P. Labat, tom. v. p. 156.*

The mountain of Tſugaar, at the northern extremity of the great province of Osju in Japan, produces agates of different kinds, some extraordinary fine, of a bluish colour, like sapphire.

AGATE is also a term used by the gold wire-drawers, for an instrument which they use in burnishing gold; it is so called from the *agate-stone* in the middle of it, that forms its principal part. See GOLD WIRE-DRAWERS.

AGE, in common acceptation signifies a man's life, from his birth to any certain time, or the day of his death: it also hath relation to that part of time wherein men live; but in the law it is particularly used for those special times which enable persons of both sexes to do certain acts, which before through want of years and judgment they are prohibited to do. As for example; a man at twelve years of *age* ought to take the oath of allegiance to the king: at fourteen, which is his *age* of discretion, he may consent to marriage, and may chuse his guardian; and at twenty-one, he may alien his lands, goods, and chattels: a woman at nine years of *age* is dowable; at twelve she may consent to marriage; at fourteen she is at years of discretion, and may chuse a guardian; and at twenty-one she may alienate her lands, &c. 1 *Inst.* 78. There are several other *ages* mentioned in our ancient books, relating to aid of the lord, wardship, &c. now of no use. *Co. Lit.* 78. The *age* of twenty-one is the full *age* of man or woman; which enables them to contract and manage for themselves, in respect to their estates; until which time they cannot act with security to those who deal with them; for their acts are in most cases either void or voidable. *Perk.* But a person under twenty-one may contract for necessities suitable to his quality, and it shall bind him; also one under *age* may be executor of a will. 1 *Inst.* 171. And at fourteen years of *age* a person may dispose of goods and personal estate by will; though not lands, 'till the *age* of twenty-one. It hath been adjudged, that if one be born on the first of February at eleven o'clock at night, and the last of January in the one-and-twentieth year at one o'clock in the morning, he makes his will of lands, &c. and dies; yet such will is good, for he was of *age*. *Mod. Caf.* 260. A person under the *age* of twenty-one may make a purchase; but at his full *age* he may agree or disagree to it. 1 *Inst.* 2. So where persons marry, the man under *age* of fourteen, or the woman within twelve, they may disagree to the marriage at those *ages*: and the law is the same in other cases. Persons under the *age* of fourteen, are not generally punishable for crimes: but if they do any trespass, they must answer for the damage. 1 *Inst.* 247. 2 *Roll. Abr.* 547. Fourteen is the *age* by law to be a witness; and in some cases a person of nine years of *age* hath been allowed to give evidence. 2 *Hawk.* 434. None may be a member of parliament under the *age* of twenty-one years; and no man can be ordained priest till twenty-four; nor be a bishop till thirty years of *age*. By statute *Westm.* 1. 13 *Ed. I.* c. 47. *age* shall not delay the demandant in a writ of entry upon disseisin in the *Per.* By statute *Glouc.* 6 *Ed. I.* c. 2. Nonage of the plaintiff shall not delay the taking an inquest in *mort d'ancestor*. *Age* shall not be allowed the vouchee in *Cui in vita*, by stat. *Westm.* 2. 13 *Ed. I.* c. 40. The full *age* of a man or woman to alien, demise, let, contract, &c. by the civil law, is 25 years; for then the Romans allowed

men to have *plenam maturitatem*, and the Lombards at eighteen years. *Co. Lit.* 78 b.

By the law of Scotland, a woman cannot *contrahere sponsalia* before her *age* of seven years. 1 *Roll.* 342. By the common law of England, persons may marry at any *age*: and upon such marriage the wife shall be endowed, if she attain the *age* of nine years of whatsoever *age* her husband be; but not before the *age* of nine years. *Co. Lit.* 33. a. And if the husband alien his land, and afterwards his wife attain the *age* of nine years, she shall be endowed of the land sold before: and if there be a writ to the bishop to certify, whether they were ever coupled in lawful matrimony, he ought to certify that they were, of what *age* soever the husband be. *Co. Lit.* 33. a. *Resolved Dyer* 369. a.

By the law of Scotland, and the civil as well as the common law, the *age* of consent to marriage of the man is the *age* of fourteen years. 1 *Roll.* 342. By the law of Scotland it is at the *age* of fourteen years. 1 *Roll.* 342.

If at the time of the marriage the husband be above fourteen, and the wife under twelve, when she attains the *age* of twelve years, the husband may disagree as well as the wife, and so *vice versa*. *Co. Lit.* 79.

A disagreement to the marriage, before the *age* of consent, is of no force; for if the husband disagree before fourteen, and marry another, the issue of the second marriage are bastards. 1 *Roll.* 341. *Contra Dyer* 13. a. in *Marg.* If after the consent, the husband or wife disagree by parol, yet cohabit as husband and wife, this amounts to an agreement. 1 *Roll.* 341.

AGE PRIER, is when an action being brought against a person under *age* for lands which he hath by descent, he by petition or motion shews the matter to the court, and prays that the action may stay till his full *age*, which the court generally agrees to. *Termes de la loy.*

But as a purchaser, a minor shall not have *age prier*, nor in a writ of assize, because it is of his own wrong, and this writ shall not be delayed; nor in a writ of dower; nor in a writ of partition, stat. 3 *Ed. I.* 38 *Ed. III.* *Hob.* 342. In a writ of debt against an heir, he shall have his *age*, for at full *age* he may plead *riens per descent*, or a release to his ancestor, and be discharged. *Danv. Abr.* 259.

AGE of a horse. This is known from his teeth, hoof, coat, tail, and ears.

The first year he has only small grinders and gatherers, of a brightish colour, which are called foal's teeth, viz. two above, and two below, and they appear browner and bigger than the rest. The third year he changes the teeth next these, leaving no apparent foal's teeth before, but two above, and two below, on each side, which are all bright and small. The fourth year he changes the teeth next these, and leaves no more foal's teeth before, but one above and one below on each side. The fifth year his foremost teeth are all changed, and the tushes on each side are complete; and those which succeed the last foal's teeth are hollow, with a small black speck in the middle, which is called the mark in a horse's mouth, and continues 'till he is eight years old. The sixth year there appear new tushes, near which is visible some young flesh, at the bottom of the tush; the tushes being white, small, short, and sharp. The seventh year his teeth are at their full growth, and the mark in his mouth appears very plain. At eight all his teeth are full, plain, and smooth, and the black mark but just discernable; the tushes looking more yellow than ordinary. The ninth his foremost teeth shew longer, broader, yellower, and fouler than before, the mark quite disappearing, and the tushes bluntish. At ten no holes are felt on the inside of the upper tushes, which, 'till then, are easily felt. At eleven, his teeth are very long, yellow, black, and foul, and stand directly opposite each other. At twelve the teeth of his upper jaw hang over those of his under. At thirteen his tushes are worn almost close to his chaps, if he had been much ridden; otherwise they will be long, black, and foul.

2. With regard to the hoof. If it be smooth, moist, hollow, and well-sounding, it is a sign of youth; but if, on the contrary, it be rugged, and, as it were, covered with seams one above another, and withal dry, foul, and crusty, it is a sign of old age.

3. If a joint about the stern of the tail, near the but-

tock,

tock, be felt to flick out more than the rest by the bigness of a nut, you may conclude him under ten, but if the joints are all smooth, he may be fifteen.

4. If the eyes are round, full, and, as it were, starting from his head; having no pits over them, but smooth and even with his temples, and free from wrinkles, both under and above, it is a certain mark of youth.

5. If the skin be taken up in any part between the finger and thumb, and, being let go, returns suddenly to its place, and remains without wrinkles, he may be judged to be young.

We may also judge of a horse's *age*, by looking on his palate; for if he is old, the roof of his mouth is lean and dry towards the middle, and those ridges, which, in young horses, are pretty high and plump, diminish as they encrease in *age*; so that in very old horses, the roof of the mouth is nothing but skin and bone. This last is a very necessary remark, especially in mares, which seldom have any tusks to discover their *age* by.

AGE of a hart, in hunting, is judged of by the furniture of his head. At a year old, there is nothing to be seen but bunches. At two, the horns appear more perfectly, but straiter and smaller. At three, they grow into two spurs; at four into three, and so encrease yearly in branches, till they are six years old; after which their *age* is not certainly to be known by their head.

AGENCY-Business comprehends any sort of business which is undertaken on the behalf, or on the account of other persons. To act in this capacity requires suitable natural and acquired talents and abilities; and, in particular, a good knowledge of men and the world.

To be well qualified for such kind of business requires a faculty and expertness. Such an one should not only have the expeditious, mechanical use of his pen, but should be master of a plain, strong, intelligent stile, in order to communicate his intentions with perspicuity. He should, in public business too, be as ready with his tongue as his pen.

In order to transact business to the best advantage of his principal, he should be a man of method, and be capable of digesting and representing the state of a case, in the clearest and most beneficial light, the more effectually to obtain his point. And to be a man of figures and accounts is as essentially necessary as any thing else; more especially, if he is any way concerned in matters of trade and money-affairs. In a word, a person who undertakes any branch of *agency-business*, ought to be one of a good general education, a genteel, affable, and communicative disposition, and to have nothing of the pedant about him.

AGENDA (*things to be done*) so merchants call a pocket or memorandum-book, in which they set down all the business they are to transact during the day, either at home or abroad.

The *agenda* is very necessary to merchants, particularly to those who have bad memories and much business, it being but too common, for want of such a remembrancer, to let slip good opportunities in trade, either of buying or selling, or negotiating bills of exchange. It ought particularly to be a constant pocket memento to factors, and agents for others, to avoid omissions prejudicial to the interests of their principals.

AGENDA is also a name by which many merchants and traders call a little *pocket-almanack*, which they carry about them for ascertaining the dates of their dispatches, bills, meetings, and the like.

AGENOIS, a province of France, bounded by Condomois on the south, Quercy on the east, Perigord on the north, and Bazadois on the west, is the most fruitful country of all Guienne, is watered by some navigable rivers, and produces a great deal of corn, wine, oil, hemp, and tobacco, with which it furnishes other provinces. Its chief places are,

AGEN, its capital, where tanned leather and the manufacture of stockings afford a pretty good trade. Its woollen trade likewise is very considerable, especially in goods brought hither from other places. These several sorts of merchandizes are carried to the fairs of Bourdeaux. The other principal articles of its trade are the wines, which grow in its neighbourhood, and brandy made from them. *Clerac*, or *Clairac* in this province,

is inhabited by rich merchants, who carry on a considerable trade in corn, wine, and brandy.

AGENT, is said of him who is commissioned to take care of the business of a corporation or some private person. In this sense, *agent* is of the same import as deputy, procurator, attorney, syndic, factor, broker. Among the officers of the Exchequer, there are four *agents* for taxes and imposts. There are also *agents* to the several regiments of the army, and *agent* victuallers for the navy. By 13 and 14 Car. II. c. 11. sect. 10. one of the bills of every entry inwards and outwards must, in order to prevent the colouring of strangers goods, be subscribed by the merchant, his own servant, factor or *agent*, with the mark, number, and contents of every parcel of such goods, as are rated to pay by the piece or measure, and the weight of the parcel of the whole of such goods as are rated to pay by the weight: and by 2 and 3 Ann. c. 9. sect. 14. The oaths of the merchants importing and exporting, required to obtain the drawback, of foreign goods, affirming the truth of the officers certificate of the entry and due payment of the duties, may be made by the *agent* or husband of any corporation or company, or by the known servant of any merchant, usually employed in making his entries, and paying his customs.

AGENT, as a term of negotiation, signifies a person in the service of a prince or a republic, who super-intends the business of his master to have it expedited. These *agents* have no credentials, but only a recommendation; neither is audience given to them as to envoys and residents; but they must apply to a secretary of state, or such other minister charged with some department. They do not likewise enjoy the privileges which the law of nations allows to ambassadors, envoys, and residents.

AGENTS of Bank and Exchange, are officers established in the trading towns of France for transacting between bankers, merchants, and others, the business of exchange, and the purchase and sale of merchandizes and other effects. At Paris and Lyons they are called *agens de change*; in Provence *consuls*; elsewhere they are called *courtiers*.

There were no regular *agents* or brokers in France till they were created by Charles IX. Since his reign they underwent many revolutions, sometimes suppressed and sometimes re-instated in office, till the last regulation made in regard to them by an arrêt of council of the 24th September, 1724. There are at present sixty *agents* of exchange at Paris, constituting a corporation that elects the syndics. They no longer assume the quality of courtiers (brokers) but that of *agents* of exchange, and this since the arrêt of council of 1639; and by the edict of 1705, they have also the title of king's counsellors. They are allowed one fourth *per cent.* of which the half is payable by him who pays his money, and the other by him who receives it, or gives value in bills of exchange or other effects. In negotiating paper, on which there is a great loss, as for instance, in contracts, on the *hôtel de ville*, or guildhall, &c. of which the buyer pays but the half of the whole sum set forth in the contract, upon account of the variation of the currency of these effects, the *agent* takes his fee on the paper, that is, on the sum it was formerly worth, and not on the money paid him, according to the currency of the place. In towns where the *agents* are not established in title of office, they are chosen by the consuls, mayor, and aldermen, who swear them. The *agents* of exchange cannot be bankers.

AGENTS of exchange of the city of Amsterdam. The city of Amsterdam is one of those which carry on the greatest trade in the world; either with regard to the large sums of money which its merchants and bankers remit to all foreign countries, either for their own account or by commission, or with regard to the almost infinite quantity of merchandizes, with which its warehouses are stocked, and which are continually imported or exported, by the trade they carry on to the very extremities of the earth.

To render that immense circulation of commerce the easier, there are in that famous city two sorts of brokers, or *agents* for exchange and merchandize. They are called *makelaers* in Dutch. Some of them are sworn brokers, and others itinerant, or ambulatory brokers.

The sworn brokers are such by way of office, as it were, and, being chosen by the magistrates, are sworn before them. Of these there are reckoned to be 375 Christians,

and 20 Jews; and, when there happens a vacancy among them, it is supplied by the burgomaster, whose turn it is to take care of the trade of the city for six months.

The itinerant brokers are those, who without having any patent or commission from the magistrates, and without being sworn before them, perform the functions of *agents* and brokers, and act in negotiations, either for drafts and remittances of money, or for buying and selling merchandizes. Their number is greater than that of the sworn *makelaers*, or brokers; so that, taking them both together, there are above a thousand persons employed in brokerage, most of whom are overloaded with business and negotiations. The only difference there is between these two sorts of *agents* and brokers of exchange and merchandize is, that the sworn-brokers are admitted to give evidence before courts of justice, in case any dispute happens with regard to their negotiation; whereas the itinerant brokers are not admitted to give evidence, and, in case of objection by one of the parties, bargains are rendered null and void.

The brokerage fees of *agents* and brokers of the bank and exchange are paid equally by those who give their money, and by those who receive it, or who furnish bills of exchange, unless they agree to the contrary.

Those brokerage fees have been regulated for Amsterdam, by the ordinances of January 1613, and of the 22d of November, 1624, at the rate of 18 *stivers* for 100 *livres de gros*, which amount to 600 guilders, or florins; that is, three *stivers* for every 100 guilders, to be paid, one half by the drawer, and the other half by him who gives his money. That the reader may the easier understand this subject of the brokerage of Amsterdam, and of the fees paid to *agents* and brokers, we shall add here the following table.

A TABLE of the brokerage fees, paid at Amsterdam, at the rate of 18 *stivers* for every 100 *livres de gros*.

For 100 <i>livres de gros</i> .	0 fl. 18 s.
For 1000 florins, or guilders	1 10
For 1000 crowns, which are reckoned as } 3000 florins	4 10
For 100 l. sterling, reckoned at 1000 florins	1 10
For 1000 daelders, or 1666 $\frac{2}{3}$ florins	2 10
For 1000 rix-dollars upon Leipzig and Breslaw	3 10
For 1000 ducats	5 00
For 1000 cruzadoes	2 10
For 1000 florins bank money, against current money	1 00
For an action of 1000 <i>livres de gros</i> of the } East-India company	6 00

Brokerage fees paid to exchange-brokers in several cities of Europe.

At London $\frac{1}{4}$ for every 100 l. sterling, which makes $\frac{1}{2}$ for each of the parties.

At Venice $\frac{2}{3}$ per 1000.

At Genoa $\frac{1}{2}$ of a crown for 1000 crowns.

At Bologna one sol for 100 crowns.

At Geneva $\frac{1}{3}$ for 1000.

AGENTS for proprietors of money, in the bank of Amsterdam, how they must be appointed. All those who have any thing to write in bank, are obliged to carry their notes themselves, in the same manner as those who have accounts are, to go and demand the balance; or if they will save themselves the trouble, they must empower one of their counting-house to act for them, which will authorize their doing the one and the other; this procuration costs thirty-two *stivers*, which is paid for down, and must be renewed at the end of a year and six weeks; and if it should happen, that one is obliged to make a pretty long voyage, and has given an authenticated procuration to his wife, or some other person, to make all sorts of payments, without having left a proportionable number of bank notes, signed in blank, to the sums he imagines he may have to pay during his voyage, if the person to whom he has given the said power, signs the bank notes without having the letter of attorney registered there, none of them will pass; and in this case, the person so authorized must carry and leave an authentic copy of his power at the Bank, and that he signs all the notes with his name, adding, by

procuracion of such a one; and the noting the said power costs fifty *stivers*, which is paid out of hand.

The time of writing in bank is from seven or eight in the morning to eleven, but after eleven to three, every note carried in will cost six *stivers*, and after three none are admitted.

When a man who has an account with the bank is ill, and unable to sign his draughts, or to go there to sign a power, the person who transacts his affairs ought to inform the bank of his disorder, and incapacity to attend there, for either of these purposes, though he is desirous of paying what he owes; in which case a declaration drawn out by a notary, and signed by the physician and one or two of his nearest neighbours or relations, should be carried to the Bank, which on receipt of it, sends a servant to see in what condition the sick person is, and if he finds him really as is declared, his *agent* is authorized to sign the draught, in the same manner as if he had signed the letter of attorney at the bank; but if the infirm is in a condition to sign, he that is empowered may request the book-keeper to draw out a procuracion for that purpose, and to send it with him to be signed, which they do, accompanied by a servant of the bank, who carries the book of procuracions with him to the sick man, who signs that drawn out for him in the book, in the presence of the bearer; and from the time that a power is thus executed, he that is made to sign and carry the notes to the Bank, although he has not yet got the extract of the power, which oftentimes is not delivered in eight or ten days; but when once the Bank has delivered it, he is obliged always to shew it when he carries a draught there, or demands a balance; if the sick man dies after executing the power, and before it is delivered to him in whose favour it is made, it will not be delivered to him at all, because the person being dead, his procuracion is of no effect.

When any one who has an account in the Bank is dead (after having made a will) his heirs, or the guardians he has appointed, must carry to the Bank an authenticated copy of the said will, paying fifty *stivers* down for noting it; at the same time they desire to know the balance of the deceased's accounts, to see whether that of his books correspond with the Bank, and they may have the said balance transported to a fresh account, either in the name of the widow, heirs, their guardians, the executors, without its costing them the ten guilders, which is always paid for opening a new one.

But if one who keeps cash at the Bank dies intestate, those who pretend to be his heirs, or meddle with the succession, must first be authorized by the proper judges, and bring a copy of their sentence to the Bank, before they will be permitted to dispose of the deceased's balance.

AGENT and patient, is the doer of a thing, and the party to whom done: as where a woman endows herself of the best part of her husband's possessions, this being the sole act of herself to herself, makes her agent and patient. Also if a man be indebted to another, and afterwards he makes the creditor his executor, and dies, the executor may retain so much of the goods of the deceased as will satisfy his debt; and by this retainer is agent and patient, that is, the party to whom the debt is due, and the person that pays the same. But a man shall not be judge in his own cause, *quia iniquum est aliquem suæ rei esse judicem*. 8 Rep. 138. Corvel.

AGGOUED-BUND, is the best of the six sorts of silk, gathered in the grand mogul's dominions.

AGIO, a bank-term. (It is a Venetian word, which signifies aid or assistance.) In most of the trading cities, where there are public banks established, the word *agio* expresses the exchanges or difference there is between money, bank money, and current money, or cash. So that if a merchant, who sells his merchandize stipulated to be paid, either 100 *livres* bank money, or 105 cash, or current money, in such a case the *agio* is said to be 5 per cent.

The bank *agio* varies in almost every place; at Rome it is near 25 per 1500; at Venice 20 per cent. fixed; at Genoa from 15 to 16 per cent.; at Amsterdam the *agio* has been always fluctuating ever since the Bank's establishment, though not in so great a degree of late years as formerly; in the year 1693, it was up to 12 and 13 per cent. on account of the bad schillings of six *stivers*, which were

were reduced to five and a half; and at the beginning of the month of April, in that year, after the diminution, it returned to two and a half, and as high as six *per cent.* it afterwards fell and rose till the year 1703, when it was down to one and a half, and two *per cent.* but since then, it has got up again, and commonly passes now from four to five *per cent.*

AGIOS at Venice, and the difference between bank and current money. There are two *agios*, the one constant and fixed of 20 *per cent.* called the bank *agio*; the other fluctuating like that of Amsterdam, and is from 120 to 128, which is called the *sopragio*, because it is calculated on the bank money, after the first *agio* is added.

As for Example,

Ducats 2000 Banco at the *sopragio* of 128
 $\frac{1}{3}$ 400 Banco *agio* of 20 *per cent.*

2400	
20 480	}
4 96	
4 96	

sopragio of 128

Ducats 3072 current

128 100 3072 to 2400 from which deducting $\frac{1}{3}$ for the bank *agio* of 120 $\frac{1}{3}$ 400

Ducats 2000 Banco.

But however the *sopragio* vary, be it 121 more or less, such sum of ducats current will be reduced to ducats 83 $\frac{1}{3}$ Banco.

From hence it appears that by making 83 $\frac{1}{3}$, the middle term, or by multiplying the current ducats 83 $\frac{1}{3}$, and dividing by the *sopragio*, the amount in bank will be given 128 83 $\frac{1}{3}$ 3072 ducats 2000 Banco

83 $\frac{1}{3}$

AGIO is also used to express the profit which arises from money advanced for a person; so that, in this sense, the words *agio* and advance are synonymous; they are used among merchants and traders, to signify that it is not an interest, but a profit for money advanced in trade. That profit is usually reckoned at one half *per cent.* for a month, that is to say, the rate of six *per cent.* *per annum.*

Some likewise give the name of *agio* of insurance, in France, to what others call *premium* in England.

AGIOTAGE, a French word, hardly ever used but in a bad sense: it signifies commonly an unlawful and usurious trade.

AGIOTER is used by the French, to signify the lending money at high interest, and carrying on an usurious traffic in notes, bonds, government securities, and other such like papers; of which the debts and incumbrances of the state consist.

AGIOTEUR, a term established among the French merchants, traders, bankers, and other people in business, signifying a person who puts out his money to high interest, by taking from the public bills, promissory notes, assignments, or bonds, and other such papers, at a very low price, to sell them out again at a very high one. *Agoteurs* are looked upon, in France, as public nuisances, and professed usurers, who under a good government should be exemplarily punished.

AGITO, called also **GIRO**, is a small weight used in the kingdom of Pegu: two agito's make a half biza, and the biza weighs a hundred teccalis, that is, two pounds five ounces heavy weight, or three pounds nine ounces, light weight, of Venice.

AGNUS CASTUS, called also **VITEX**, the chaste tree, with narrow hemp-like leaves and seeds like pepper.

C. B. It was formerly in great request, particularly for allaying venereal heats, and preserving chastity; but it is very rarely used at present.

AGNUS DEI, a piece of white wax in a flat oval form, like a small cake, stamped with the figure of a lamb, and consecrated by the pope. By statute 13 *Eliz.* c. 2. *agnus dei*, crosses, &c. are not permitted to be brought into this kingdom, on pain of a *præmunire*.

AGNUS SCYTHICUS. This is the wonderful plant, or kind of intermediate body, supposed to partake both of the nature of an animal and a vegetable, so much celebrated by Scaliger, Kircher, Sigismond, Hefberetein, Hayton Armenian, Surlus, Lord Chancellor Bacon, Fortunius Licetus, Andrew Lebarus, Eusebius of Nuremberg, Adam Olearius, Olaus Wormius, and a number of other botanists. It is described by them as perfectly resembling a lamb by the feet, nails, ears, and head; and it only wants horns, in the place of which there is a tuft of hair. It is covered with a thin skin, of which the Tartars make bonnets. They also say that its pulp or pith resembles the flesh of a lobster, that blood issues by making an incision into it, and that its taste is exceeding sweet.

It would be scarce possible, after so many authorities that attest the existence of the *agnus Scythicus*, and after the detail of Scaliger, who only wanted to know how the feet were formed, to believe that the lamb of Tartary was a fable. Kempfer, who was not less versed in Natural History than in medicine, had travelled into Tartary; but his most diligent enquiries concerning this lamb, were quite fruitless, having indeed, he says, acquired nothing more by them, than the shame of being too credulous. He adds, that what may have given room to this apocryphal account, is the use made in Tartary of the skin of certain lambs, whose dams are killed before their yearning time, in order to procure wool of a finer quality. Cloaks, gowns, and turbans are edged or bordered with those lamb-skins; and travellers, either deceived in regard to the nature of these skins by their ignorance of the country language, or from some other cause, have afterwards imposed on their country-folks, by describing to them as the skin of a plant, the skin of an animal.

Sir Hans Sloane says, that the *agnus Scythicus* is a root upwards of a foot long with tuberosities, from the extremities of which some stalks proceed between three and four inches in length, and pretty much like those of the fern, and that a great part of the surface is covered with a dark yellowish down, glossy like silk, a quarter of an inch long, and that it is used for the spitting of blood. He adds, that several fern-plants are found in Jamaica, which grow to the thickness of a tree, and are covered with a kind of down, like that which is observed on our capillary plants; and furthermore, it seems, that art has been used to give them the figure of a lamb, for the roots resemble the body, and the stalks the legs of that animal.

Here then is all the marvellous of the Scythian lamb reduced to nothing, or at least to very little, to a shaggy root, which is made to receive something of the resemblance of a lamb, by fashioning it into such a figure.

AGRA, capital of the Mogul's empire and the center of its trade, is situated in twenty-eight degrees, on this side the line, on the river Gemini, or Gemma, which falls into the Ganges. The number of its meidans, where the public markets are kept for all sorts of provisions; of its covered bazards, where each merchant and artificer have their shops and quarters, of which some are half a quarter of a league long; and that of its caravanferas (above eighty in number) suffice to demonstrate both the greatness of its extent, and the importance of the commerce carried on here by foreigners and its inhabitants, which is maintained by several caravans from Amadabath, Surat, and other places, commonly composed of four or five hundred camels, and by which conveyance, the English, French, Dutch, Moors, Turks, Arabians, Persians, and other nations, send their merchandizes to, and receive others from this capital, as may suit their business.

Besides the indigo of this city (which is the best in the world) a large quantity of silk stuffs and linens are exported;

ported; these latter principally to the west and north; and it is here, that all the merchandize of Bouten and Tartary are bought, and where the merchants of the interior parts of Indostan also come.

Great Britain once had a factory here, but the long distance to Surat, and the hazards and difficulties they underwent in passing thither, made them withdraw it, though they continue to trade here.

The Dutch, who have still a factory in this city, trade chiefly in scarlet, looking-glasses, silver, gold, and white lace, hardware, indigo, cloth of Jelapour, and spices. They have houses at several other towns, to which they send factors once a year; and have always some persons near the court, to prevent being imposed on by the covetous, tyrannical vice-roys and governors near their other settlements.

The charges on merchandize bought at Agra, for Surat, amount from 15 to 20 *per cent.* including the remitting of bills of exchange at 5 *per cent.* packing up, carriage, and the duties or toll for the roads, according to their several qualities.

It must also be observed, that, in all the dominions of the Grand Mogul, the penalty for defrauding the custom-house of the duties of importation, or exportation, is not the forfeiting of the merchandize, but only paying double the duty, when the fraud is discovered.

The indigo that is cultivated and prepared in the dominions of the Grand Mogul, particularly that of Agra, is always 20 *per cent.* dearer than that of the other parts of the East-Indies: it is in round cakes or balls.

As there are three sorts of indigo; namely, that of the first leaves, that of the second, and that of the third, the Indians endeavour to sell the one for the other, though that of the second leaves is worth 12 *per cent.* less than that of the first, and the last 20 *per cent.* less than the second.

The imposition may be discovered by the colour, and by breaking some bits of the paste; that of the first leaves being of a bluish purple, more shining and bright than the two others, and the second sort of a deeper colour than the first.

Another method they have of deceiving in the sale of indigo is this: when it is reduced into a paste, they dry it upon sand, some of which always sticks to it, and increases its weight; or when it is dry, they keep the paste in a damp place. The adulteration made by sand mixed with it, may be known by putting the indigo into the fire; the indigo will be consumed, and there will remain nothing but the sand.

AGRA, an odoriferous wood, that comes from the isle of Hayman, in China. Three sorts are distinguished of different value; but we are told nothing concerning the nature of this wood, nor of the plant that produces it. The finest sort is said to be bought at Hayman, at the rate of eighty taels the foot, and is sold at Canton for ninety.

AGRA-CARAMBA, another odoriferous sort of wood, which comes likewise from Hayman, but of which we have as little information as of the *agra*. It is said that it costs sixty taels the cati, and is sold at Canton for eighty, that it is purgative, and that it is much in request among the Japanese.

AGRAHALID, a plant of Egypt and Ethiopia called by Ray, *Lycio affinis Aegyptiaca*. It is according to Lémery, a tree as large as the wild pear-tree, with few branches, thorny, and resembling the lycium. Its leaf is little different from that of box, except being larger, and not so thick-set. Its flowers but few, are white, like those of the hyacinth, but smaller. They are succeeded by small black fruit, of a styptic bitter taste. The leaves, which are subacid and astringent, yield a decoction that kills worms.

AGREAGE, the traders at Bourdeaux so call what is elsewhere called *courtage*, (brokerage.)

AGREEMENT, is the consent of two or more persons concurring, the one in parting with, and the other in receiving some property, right, or benefit. The notion of contracting or entering into *agreements* arose from the increase of commerce, and the necessity men were under of bartering their superfluities for things of real use, and which lay out of the way of their acquiring. That men

should execute their *agreements*, and perform their promises, though made without writing or consideration, is enjoined by the law of nature; but in civil societies, and in ours in particular, circumstances are required which protect the weak, and those who are under the power of others; also provision is made against fraud and circumvention, and that no man should be injured in his property by the turn of any unwary expression. 1 *New. Abr.* 67.

Though a contract executed with all the solemnity required by law, may properly be called an *agreement*; yet, in the more common acceptation of the word, articles, minutes, and escrow, &c. containing something preparatory to a more solemn and formal execution, are called *agreements*. 1 *New. Abr.* 67.

A person *non compos* is not capable of entering into any *agreement*, for an *agreement* is an act of the understanding, which they are incapable of; and therefore they are to be under the care of their curators or guardians, by a commission from the public. 1 *New. Abr.* 67.

Also an infant, for the same reason, is generally incapable of contracting.

A wife, during the intermarriage, is incapable of entering into any *agreement in pais*, being under power of her husband.

The ancestor seized in fee may, by his *agreement*, bind his heir; therefore if A agrees to sell lands, and receives part of the purchase money, but dies before a conveyance is executed, and a bill is brought against the heir, he will be decreed to convey, and the money shall go to the executor, especially if there are more debts due than the testator's personal estate is sufficient to pay. 2 *Vern.* 215. *Abr. Eq.* 265.

So if a father conveys to a younger son, by a defective conveyance, and dies, the heir at law in two cases shall be compelled to make it good. 1. Where there is a covenant for further assurance, binding the heir, because the heir is bound by the covenant. 2. Where there is a provision made by the father in his life-time for the heir, or he hath such a provision by descent from the father, 1 *New. Abr.* 68.

In many cases the party injured by breach of an *agreement*, may have a remedy either by action at common-law, or have recourse to a court of equity; but here a general rule must be observed, that wherever the matter of the bill is merely in damages, there the remedy is at law, because the damages cannot be ascertained by the conscience of the chancellor, and therefore must be settled by a jury. See *Abr. Eq.* 16.

But if there be matter of fraud mixt with the damages; as if A sues B on a covenant at law for damages, and B files a bill for an injunction, upon this equitable suggestion, that the covenant was obtained by fraud, if A files his cross bill for relief upon that covenant, the court will retain it, because the validity of the covenant is disputed in that court, and on a head properly cognizable there; and therefore, if the validity of the deed be established, the court will direct an issue for the *quantum* of the damages. *Abr. Eq.* 17. 1 *Chan. Rep.* 158.

So where the *agreement* is to do something in specie, as to convey lands, execute a deed, &c. there it will be proper to apply to a court of equity for a specific execution, to which the party is entitled, if the *agreement* be good and sufficiently proved, when otherwise he could only recover damages at law. 1 *Chan. Ca.* 42.

The plaintiff assigned some shares of the excise to the defendant, who thereupon covenanted to save him harmless, and to stand in his place touching all payments to the king; the plaintiff being sued by the king, brought his bill to have the *agreement* performed in specie; and although it was insisted that the plaintiff might recover damages at law, and that this was not a covenant for any thing certain, and by this means a master in chancery was to tax damages instead of a jury; yet it was decreed that the defendant should perform his covenant; and it was directed to a master, that, as often as any breach should happen, he should report it specially, that the court, if occasion should be, might direct a trial in a *quantum damnificat*. 1 *Vern.* 189. 2 *Chan. Ca.* 146.

So if a jointress brings her bill to have an account of the real and personal estate of her late husband, and to have a satisfaction thereout for a defect of value of her jointure-lands, which he had covenanted to be and to continue of such value; and the defendant insists, that this is a covenant which founds only in damages, and properly determinable at law; though it be admitted that a court of equity cannot regularly assess damages; yet in this case, a master in chancery may properly enquire into the value and defect of the lands, and report it to the court, which may decree such defect to be made good, or send it to be tried at law, upon a *quantum damnis*. *Abr. Eq.* 18.

The condition of a bond was to settle certain lands in such a manor, by such a day; the obligor died before the day; so that the bond was saved at law, yet the court decreed a specific execution. *Abr. Eq.* 18.

But here it must be observed, that *agreements*, out of which an equity can be raised for a decree in specie, ought to be obtained with all imaginable fairness, and without any mixture tending to surprize or circumvention; and that they be not unreasonable in themselves. *Abr. Eq.* 17.

As where by marriage agreement the son's intended wife was to have more than would have been left for the father (though indebted) his wife and two daughters unpreferred; the court would not decree it, principally, by reason of the extremity of it, but left the party to his remedy at law. *2 Chan. Ca.* 17.

So where A articulated for the purchase of B's estate, pretending he bought for one whom B was willing to oblige, and thereby got it somewhat cheaper, when in truth he bought it for another, equity would not decree an execution of this agreement. *1 Vern.* 227.

But as these cases, and all others on this head, depend so much upon circumstances, and are to stand or fall according to the degrees of fraud and circumvention attending them, and proved in the cause, or by what appears unreasonable on the face of them, I shall only observe that a court of equity will much easier be prevailed on to dismiss a bill which prays a specific execution of an unreasonable agreement, than set aside an agreement, though not strictly fair, on a bill for that purpose; for this deprives the party of what he had a right to by law; and that where such agreements are set aside, it must be on refunding what was *bona fide* paid, making allowance for improvement, &c. *1 New. Abr.* 70. *3 Chan. Ca.* 136. *1 Vern.* 271. *2 Vern.* 15, 27.

As men have a property in their acquisitions, so may they dispose of them at their pleasure, and without valuable consideration; but if a man promises to convey lands, or to give goods without valuable consideration, or without delivering possession of them, this alters no property, nor has the party any remedy in law or equity, being *nudum pactum unde non oritur actio*.

But if it be done by deed duly executed, under seal, this is good in law, though there be no consideration or no delivery of possession; because a man is estopped to deny his own deed, or affirm any thing contrary to his manifest solemnity of contracting. *Yelv.* 196. *Cro. Jac.* 270. *1 Brownl.* 111. *6 Co.* 18. b.

Also in equity, voluntary conveyances are good against the parties, and cannot be revoked, nor will the court interpose in behalf of one volunteer against another; but if they affect creditors, purchasers, or younger children, the court will set them aside. *1 Chan. Rep.* 173. *1 Vern.* 100, 464.

If there be a defective conveyance, without an equitable consideration, a court of equity will not oblige the party to make it good, though there be a covenant for further assurances; as if a man makes a feoffment to a stranger without livery, the feoffor or heir shall not be obliged to make good that feoffment, but it shall be construed in equity to be an estate at will, as it is in law. *2 Vent.* 365. *2 Vern.* 40. *2 Vern.* 475.

If an annuity is granted by one to his house-keeper, with a bond for payment of it, and the bond is lost, equity will decree payment of the annuity; for service is a consideration, and no *turpis contractus* shall be presumed, unless proved. *Abr. Eq.* 24.

If one is bound to transfer 300 l. East-India stock before such a time, which he neglects to do, and stock is much risen, he shall be obliged to transfer the stock in specie, and account for all dividends from the time that it ought to have been transferred. *2 Vern.* 394. See *Prec. in Chan.* 533.

If a creditor agrees with a debtor to take less than his debt, so that it be paid precisely at such a day, and the creditor fails of payment, he cannot be relieved, *for cuius est dare ejus est disponere*. *Vern.* 210. *1 Chan. Ca.* 110.

If money be lent on mortgage at 5 per cent. and the mortgager covenants to pay 6 per cent, if he made default for the space of sixty days after the time of payment, if he makes default, the court will not relieve, this being the agreement of the parties. *2 Vern.* 134.

If a lessee, for a long term of years, covenants to lay out 200 l. upon the premises, within the first ten years, and lays out but 30 l. and after the expiration of thirty years of the lease, the lessor brings an action of covenant, and recovers 150 l. damages, equity will neither relieve against the damage, nor decree the money to be now laid out in improvements; for though the damages seem excessive, yet the jury were proper judges; for it is probable the lessee would not be so careful in laying it out in lasting improvements, as he would be were it laid out at first. *1 Vern.* 316.

AGRICULTURE, the art of tilling and cultivating the earth, in order to render it fertile, and make it bear plants, trees, fruits, &c.

The principal operations in *agriculture* are manuring, plowing, fallowing, sowing, harrowing, reaping, mowing, &c. And to these belong the management of the productions of particular places and countries; as hops, hemp, vines, tobacco, saffron, liquorice, woad, &c. To the same art belong also planting, transplanting, pruning, engraving; the culture of forests, timber, coppices, &c. But *agriculture* in general consists either in feeding or tillage, whereby are raised store of cattle, corn, and fruits, proper for food and traffic.

To begin with feeding: and here might be enumerated the various sorts of cattle raised and bred by the care of the husbandman; but the most essential with respect to our trade are, 1. The cattle for beef; which, besides the excellency of its flesh for nourishment, affords many necessities for our trade, and is extremely serviceable in tillage: with this we both nourish our inhabitants at home, victual our ships for foreign voyages, and load them with the several manufactures it supplies us with: from the milk we make butter and cheese; from the skin, leather; from the fat, tallow; and of the horns, several useful necessities: the overplus whereof, above our own consumption, we export, and sell in foreign markets.

2. The sheep; whose golden fleece, being the basis of our woollen manufactures, employs multitudes of our people; and the wool, being of different lengths and fineness, makes them of various sorts; whereby those animals afford us a yearly crop, whilst living; and, at their deaths, we have their flesh and their skins for variety of uses.

3. Horses, whose labour is so necessary, that we can neither carry on our husbandry or trade without them: add to this their fitness for war, being esteemed the most courageous in the whole world, and for these uses they are also transported abroad, as a trafficable commodity: but their flesh is of no use, their skins little; the leather made of them being very ordinary, only the longest of their hairs is used in weaving hats for the ladies, and some sorts in periwigs for the men.

There are sundry other sorts of beasts, some whereof require no care in raising, others little; such as the stag, the deer, the rabbit, the hare, the badger, the goat, and divers others, whose skins are necessary for our trade, and useful in our manufactures.

Tillage is that whereby we raise our corn, by turning up and manuring the land; the several sorts of corn are wheat, rye, barley, pease, beans, vetches, oats, &c. all which not only afford nourishment to ourselves, and the beasts we use in labour, but serve for considerable articles in our commerce; as they give employment to our people at home, and are transported abroad, according to the surplus

surplus of our domestic consumption, and the want of our neighbours, besides the large quantities expended in our navigation.

These products are all clear profit to the nation, being raised from earth and labour: but their principal benefit to the community arises from their exportation by our merchants, either in their own kinds, or when wrought up, the remainder, which is spent at home, tending rather to supply our wants than to advance our wealth; which exports being, more or less, according to the price they bear in other countries, and these arising from the proportion their lands hold with ours in their yearly rents, are not so great in specie as when wrought up. Butter simply is the chief wherewith we supply several foreign markets; and did formerly more, till by making it bad, and using scandalous arts to encase its weight, England lost most of that trade, and is beaten out of it by Ireland, which every year makes theirs better: besides, they undersell England in the price, as they do also in beef, occasioned by the lower rents of their lands.

It was the act of prohibition made formerly in England, that first introduced them into a foreign traffic, their sole dependence before that time being on the English markets, and from hence they were supplied with what they stood in need of; but, being thereby prohibited from bringing their cattle, and other provisions to England, they endeavoured to find a vent for them in other markets, which they did with good success, and to more advantage: the sweetness whereof gave a spring to their industry, and put them on the woollen manufactures, which they vend also where they exported their provisions; till, in time, it became so great and flourishing as to give us apprehension it would endanger ours.

As for corn, foreign markets are frequently supplied therewith, both from thence, and from the islands of the Azores, cheaper than the rents of our lands will admit; but the British plantations have some dependence on England for our product; and, as the lands of Ireland rise in their yearly value, they will have more. We also raise, by agriculture, considerable quantities of hemp and flax, both which are useful in our trade.

Among the several trees that adorn our fields, the oak, the elm, and the ash are the chief; these not only serve for the buildings of our ships and houses, but also furnish us with materials wherewith our artificers make great variety of things fit for our commerce: and it were to be wished, that better care was taken to preserve our timber, for the benefit of posterity.

This gives us a short idea of the effects of husbandry, which is apparently the original source of most of our treasures; the due cultivation of the earth being the great fountain of all materials for trade, and the arts of commerce render them the more valuable to their proprietors.

It is certain, therefore, that it will ever be good policy to ease the land, in order to promote trade; and to encourage the trading interest, in order to promote the landed.

Every object of traffic requisite to the sustenance of life being produced by the earth, the more our lands in general shall be improved and cultivated, and the greater plenty we shall have of vegetables and cattle of every kind, the more populous will the nation be in useful hands, and the more comfortably and happily will the people subsist. As those productions augment, so will the general consumption; the greater plenty, the cheaper will every thing be, whereby trade will flourish, and money also grow proportionably plentiful in general circulation; and in such case, less money will purchase every thing in proportion as the plenty of land productions shall reduce the produce, with respect to the demand.

By the general improvement of the old, and cultivation of fresh lands to a degree requisite to render things in general cheap and plentiful, such plenty will soon be so magnified, as to reduce the price of the necessaries of life to one half, if not one third of what it is at present. This likewise will reduce the general price of labour, that being regulated by the price of the necessaries of life. Will not this make all our fabrics and manufactures

cheaper as well among ourselves as foreigners, since their value is constituted according to the rate, at which artificers and manufacturers can subsist? Will not this naturally extend our exportations, not only amongst our present foreign customers, but attract new ones, who at present are incapable of purchasing our commodities, by reason of their excessive dearth? Will not this prevent our competitors in foreign commerce, who are now studiously promoting every art of agriculture, to rival and supplant us in that which is the great support of the whole British empire?

In countries where the land cultivated does not afford an ample competency of its productions to make the whole plentiful, and therefore cheap, will not the people in general be inevitably distressed and miserable? Can any chains restrain their transmigration, from country to country, till, with some degree of consolation, they shall be able to sustain the perpetual state of labour? Where this policy is disregarded, will it not tend to depopulation; where regarded, have the contrary effect?

If the rents of lands shall be raised above what the quantity of circulating money will enable tenants to pay, will not the money of a nation grow scarcer and scarcer? Where there is not a quantity of land effectually cultivated to reduce the rents, in proportion to the money, will not the scarcity of money at length grow so great, as to leave little in the kingdom? For where the rents are kept up beyond the proportion of money to pay them, will not every thing rise in its price and value, commerce grow worse and worse, its general balance turn more to the disadvantage of the dearer nation, and at length the nation become stripped of its money as well as its people?

Did not the demand for farms in greater proportion than they were to be had, first raise their rents? Did not this deter people from increasing the cultivation of fresh land, as the demand shews they would, as they increased in number? What could the surplus people do, but strike into trades and professions? Whilst the necessaries, the price of labour, rents of lands and manufactures have advanced amongst us, have not those engaged in trade and professions found it also difficult to live? Will not more and more be daily undone, if the monstrous dearth of things continues as it does? Can the gentleman flatter himself with escaping a proportionate injury with the rest of the people? If money becomes scarcer and scarcer, will not monopolizers, forestallers, and regraters, multiply to enhance still more and more the prices of provisions, since the produce of the earth at a cheap rate will not bring sufficient support to the farmer, and pay all charges to which he is liable? Does not this increase, instead of lessen, the evil?

To increase money, to keep up the payment of rents, can it otherwise be effected than by the increase of such foreign commerce as will bring us in an increased balance? but how can this be expected, except by a decrease in the price of our commodities, which only will or can encourage and enable foreign states and empires to buy them? Can this be effectually done, till the price of rents is reduced in proportion to the quantity of money? This cannot be accomplished, till a due quantity of waste land is taken into cultivation. This measure will make farms abound, the only natural way to lower rents in general.

Nor does it appear that gentlemen would be sufferers by lowering of rents, by such means. Let it be supposed, that all our lands shall be raised 20 per cent. per annum; now if that land cultivated will bear no more corn, grass, nor cattle, &c. than it does at present, must not the corn and cattle be advanced in proportion? Will not the necessaries of life cost the labourer more, and his wages be raised accordingly? All things would certainly be raised, if money could be found to circulate trade at such an advance; and since gentlemen as well as the labourer would buy every thing at such an advanced price, how could they be advantaged by receiving 20 per cent. per annum more, and paying the same, or more, for what they stood in need of?

If it should be said, that although this might be the case with regard to their expence, yet it would not be so to their savings, they will be deceived. Supposed

pose a gentlemen of 1000*l. per annum.* now spends 500*l.* and lays by 500*l. per annum*; if estates were raised 20 *per cent.* as supposed, he would then spend 600*l.* and lay by 600*l. per annum.* But how would he be the richer, since the price of every thing is raised at least in the like proportion? The necessities of life will cost the labourer more, and his wages must be raised accordingly. Timber for carriages, and other uses, will cost more to fell and hew; horses to draw the produce of the earth will be more expensive, and consequently carriage, and every manufacture, will cost more. All things in general will certainly be raised, while money can be found to circulate trade at such an advance; and as gentlemen themselves, as well as others, would buy every thing at such a raised price, how would they be benefited by receiving 20 *per cent. per annum* more, and paying that at least for all they wanted?

The purchase of estates being governed by the interest of money, will be valued at as many years as if rents had not fallen; and though the sum for which they sell will be annually less, as the rent shall be lowered; yet the money will have, at least, all the same effect, apply the same as you please. If the lands were raised 20 *per cent. per annum*, this would not make them produce more, but perhaps less, than they now do, by putting it out of the farmer's power, in some degree, to use so much skill and expence in cultivation as before rents were so raised: and as this advance of rent would not tend to encrease the produce, all the produce must be sold, not only for all the twenty pounds more, but there must be profits likewise on all those twenty pounds, to enable the farmers to purchase whatever they wanted at the higher prices, to which every thing will be enhanced from the general rise of things, as it passed through every hand, comprehending the manufacturing part also; this still would proportionably encrease the profits on the first raised prime costs, before they reached the consumer; and must not he in the end, not only pay the advanced twenty pounds rent, but the enhanced profits arising thereon, through all the several hands it passed? And since labour, which adds the greatest value to every thing, will in this case be enhanced too, it is apparent, that the same quantity of produce must be dearer by all the first advanced twenty pounds rent, and by suitable profits to all the several hands through which things pass, together with a greater charge of labour thereon. Whence it is evident, that if the same quantity of produce must thus cost a great deal more than all the twenty pounds rent, by which it was enhanced, the several parts thereof must cost more likewise in such proportion; so that we may not scruple to assert, that 140*l.* could not in this case purchase more than 100*l.* did before the rise; whereby gentlemen, who are consumers in common with others, would become poorer for raising their estates; and therefore it should consequently seem manifest that they would be the richer for lowering their estates 20 or 30 *per cent. per annum*, by a due encrease in the cultivation of more land, since it must be no less certain that 70*l.* or 80*l.* would purchase more in this case than 100*l.* does at present, because it is evident that 120*l.* in the other case would not purchase so much as 100*l.* doth now. So that if rents should fall 30 *per cent* by a larger land cultivation, every thing would certainly fall in the same proportion, whereby gentlemen would lose nothing but the nominal sound of so much *per annum*.

This obvious reasoning evinces why gentlemen cannot live so well and hospitably on the same estates as their ancestors did, who had considerably less nominal income than their successors. If therefore gentlemen find themselves frightened by raising rents, above what the circulating money amongst them will enable them to pay; must not this encrease the freights and difficulties of the people on whom such heavy rents are raised, and account for their arrears and badness of payments?

AGRIMONY, or *Eupatorium* of the Greeks. This genus of plants is placed by Dr. Tournefort in the ninth section of his sixth class, intitled, "Herbs with a rose-flower, whose cup changes to a dry fruit."

The common *agrimony* is well known by all the herb-folks. It grows wild upon banks near woods and hedges

in most parts of England, and is there gathered and brought to the markets.

The virtues of the common *agrimony* have been fully set forth by all the writers on the *Materia Medica*. The whole plant has been recommended for use. A distilled water of the leaves and flowers of the plant has been long established as a shop-medicine; and a syrup made of the juice of the plant, is by some greatly recommended in diseases arising from the weakness of the liver. The qualities ascribed to this plant are; it warms, dries, cleanses, binds, and strengthens; it is also esteemed as a good vulnerary herb.

The sweet *agrimony* makes a very pleasant tea; and if a little of the round-leaved sorrel, or of the common wood sorrel is added to it, these will make a pleasant, wholesome drink, for those who have a thirst; as I can, from long experience, myself certify. *Miller*.

AJAN, a coast and country of Africa; has the river Quilmanci on the south; the mountains from which that river springs on the west; Abyssinia, or Ethiopia, and the freight of Babelmandel on the north; and the Eastern, or Indian Ocean on the east. Going from south to north, along the coast, we find the republic of Brava, the kingdom of Magadoxo, and that of Adel, and some other more westward within the land. The coast abounds with all necessities of life, and has plenty of very good horses. The kings of Ajan are often at war with the emperor of the Abyssins, and all the prisoners they take they sell to the merchants of Cambaya, those of Aden, and other Arabs, who come to trade in their harbours, and give them in exchange coloured cloths, glass beads, raisins, and dates; for which they also take back, beside slaves, gold and ivory. The whole sea-coast, from Zanguebar to the freight of Babelmandel, is called the coast of Ajan; and a considerable part of it is stiled the Desert-coast. Its kingdoms, or provinces, are as follow:

1. *Brava*, the capital of a republic of the same name, is situate between two arms of the river Quilmanci, where it has a pretty good harbour. It is a pretty large city, and is inhabited by merchants, who trade in gold, silver, silks, stuffs, &c. and pay an annual tribute to the Portuguese. There is a great deal of ambergrease on the coast of Brava.

2. *Magadoxo*, or *Madogaxo*, has the kingdom of Adel on the north; the kingdom of Alaba on the west; the territories of Brava on the north; and the Eastern Ocean on the east. This country abounds with barley, and other fruit, and feeds great numbers of horses and other cattle.

To the capital city Magadoxo a great many merchants of Cambaya and Aden bring stuffs, drugs, and spices, which they exchange for gold, ivory, and wax.

3. *Adel* has Magadoxo on the south; part of the Eastern Ocean, and that part of the coast of Ajan which is called the Desert-coast on the east; the freights of Babelmandel on the north; and the Galles, with the kingdoms of Dancari and Balli, on the west.

The town of Zeila, seated in a gulph to the south-east of the mouth of the freight of Babelmandel, is extremely populous. The soil about Zeila is nothing but a dry, barren sand, and they are obliged to fetch fresh water two days journey from the city: but, at that distance, the country abounds with corn and fruit to such a degree, that the inhabitants cannot use it all, and the Arabs of Aden, and other neighbouring countries, come and make their provisions here. The country abounds also with cattle; besides which, they have also here gold, ivory, frankincense, pepper, and great numbers of slaves, whom they buy, or steal, in Abyssinia, all which they exchange with the merchants of Arabia and Cambaya for cloth, amber, necklaces, glass beads, raisins, dates, &c. The inhabitants of Quiloa, Melinda, Mombasa, and other parts, come and buy horses at Bar-bora, another sea-port town on this coast.

4. *Dancali*, *Dancale*, or *Dangale*, lies to the west of the Red-Sea, to the east and south of Abyssinia, and to the north of Balli and Fatagar. It has a sea-port town called Bailar. Here is a place called the Land of Salt, because it contains mines, out of which they dig vast quantities of salt, which is carried into other coun-

tries on camels, and affords a considerable trade. The soil here is almost every where barren, and produces no corn at all.

AID is the same with the French *aide*, and is generally understood to be a subsidy granted to the crown. By the ancient law of the land, the king and any lord of the realm might lay an *aid* upon their tenants, for knighting an eldest son, or marriage of a daughter; but this was taken away by the statute. 12 *Car. 2. c. 24.* This imposition, which was levied in former times, seems to have defended to us from Normandy, or rather from the feudal law. *Grand. Custom. c. 35.* It is said to differ from tax in signification; for taxes were anciently levied at the will of the lord, upon any occasion whatsoever, but *aids* could not be levied but where it was lawful and customary so to do; as to make the eldest son a knight, marry the eldest daughter, or redeem the lord from prison. By statute 34 *Ed. 1. c. 1.* it is ordained that the king shall levy no *aid* or tax without his parliament. *Corwel.*

AIDERBEITZAN, or as the Persians call it *Azerbeian*, or *Asapaican*, a province in Persia, borders on the east to the province of Ghilan and Tabristan; to the south on Persian Irak; to the west and north west upon Upper Armenia and the river Aras; and to the north, on Schirwan. The soil of this province is fruitful, and the climate healthy, though cold. It contains,

1. *Tauris*, a very large and potent city, being the second in Persia, for dignity, grandeur, riches, trade, and number of inhabitants. The city contains 15,000 houses, and as many shops; for the houses in Persia are not in the same place with their shops, which stand for the most part in long and arched streets forty or fifty feet high, which streets are called bazars, or markets, and make the heart of the city; the houses being in the out-parts, and having almost all gardens belonging to them.

These at Tauris are the finest bazars that are in any place of Asia; and it is a lovely sight to behold their vast extent, their largeness, their beautiful cupolas, and the arches over them, the number of people that are there all day long, and the vast quantity of merchandizes with which they are filled. The grandest of all, and where they sell their jewels and wares of greatest value, is octangular, and very spacious, being called *kaiserie*, or the royal market-place. Their other public buildings are no less sumptuous, nor less populous. The houses where they sell tobacco, coffee, and strong liquors, are answerable to the beauty of the rest. The inhabitants of this city amount to about 550,000 souls, though several persons there say there are no less than 1,100,000. The number of strangers also, which are there at all times, is very great; these resorting thither from all parts of Asia: nor is there, perhaps, any sort of merchandize of which there is not a magazine to be found at Tauris. The city is full of artists in cotton, silk, and gold; and several of the principal merchants there affirmed to Sir John Chardin, that there are above 6000 bales of silk wrought out in manufactures every year.

The trade of the city extends all over Persia and Turkey, into Muscovy, Tartary, the Indies, and over the Black-Sea. Not far from the city, in the neighbouring parts, are to be seen great quarries of white marble, of which there is a sort that is transparent. The people of the country imagine it to be water of a mineral fountain, congealed and hardened by degrees: there are, indeed, not far from it, two considerable mines, the one of gold, the other of salt; but there has been no working in the gold mine for a long time, because they always found that the profit never answered to the expences of the labour.

The bazars at *Ardebil*, or *Ardevil*, are fine and well covered; but here they deal very little in gold stuffs and jewels, as they are said to have done formerly, and as they do in other places. Here are but three or four large streets where the chief shops are; the rest are not worth speaking of; and, indeed, trade flags here very much. The meidan, or great square, is 300 paces long, and 150 broad, having shops all round it, which, when this city was in its flourishing condition, were well-stocked with valuable commodities; but the richest goods, such as jewels, gold, silver, silk, &c. were kept in another market-house, or exchange, which is a square building, arched over, and opens at three gates, into three long streets.

At *Miana* there is a kind of custom-house, where the officers are said to be very tyrannical in their exactions upon the meaner sort of people, who trade that way.

Soltanaya, or *Sultania*, has some bazars, but not considerable; nor, indeed, can it be reckoned a trading place.

AIGRIS, a stone which serves instead of current coin among the Iffinois, a nation of Africa, on the coast of Guinea, where the river Asbin runs, near the Gold-coast. It is there looked upon as a precious stone, and yet has nothing in it to make it very valuable. It is of a greenish-blue colour, without any lustre; pretty hard, indeed, but does not take a good polish, neither have they skill enough to polish it better. And yet they are so fond of it, that when they buy it, they give its weight in gold for it. They make little bits of it, called *betiquets*, which are bored through in the middle, that they may string them on small threads, made of the bark of trees. Considering the price of that stone, the *betiquets* must be extremely small, since two of them are worth but one penny French money. They cut some in the form of cylinders, an inch long, and they are bored through lengthways. They serve as ornaments for the beards of the kings and lords, making tresses of the hair, which they pass through those cylinders. Akæfimi, king of the Iffinois, had, in the twenty tresses of his beard, sixty of those cylinders, which were worth, at least, 20,000 crowns. But, for all that, this pretended precious stone is not so shining and bright as green *rasade*, which is brought thence from Europe. "I am pretty much inclined to think," says the Chevalier de Marchais, in his *Voyage de Guinée*, tom. i. p. 261, that the *aigris* is the same as the stone called *jade*, or a kind that comes near it, but is not well polished by the Iffinois, which is owing to their want of skill."

AIRSHIRE, contains three great bailiwicks of Scotland, viz. *Carrick*, *Kyle*, and *Cunningham*, which differ in the fertility of their soil, though none of them are barren; they produce corn and cattle, but not in any great plenty. The inhabitants, being an industrious people, are many of them employed by the merchants of Glasgow, and other places, in their herring fishery. The river *Aire* abounds with salmon and trout, as Lady-Isle (about five miles from the town of *Aire*,) does with fowl and rabbits; and from Irwin great quantities of Scotch coal are exported for Ireland.

AKOND, the title of the third pontificate of Persia. He is an officer of justice, and properly the first civil lieutenant; taking cognizance of all cases of orphans and widows, of contracts, and all other civil affairs. The king allows him an annual pension of 2500 pounds, that he may not take any thing of the contending parties.

ALABASTER, a kind of stone, resembling marble, but softer.

There are various colours of this stone, but that which is white and shining is the most common. It is much used by sculptors, for small statues, vases, columns, &c.

ALADULIA, a province of *Anatolia*, or *Asia Minor*, comprehends, in its largest sense, *Cappadocia Magna*, and the *Lesser Armenia*. It joins to the country, or Beglebergate of Trebizond on the south, and is, by the Turks, called the Beglebergate of Munit, or Marasch. This district is likewise called, by the Turks, *Dulgadir*, or *Dulcadir*. The territory of this province is unfit for tillage, but hath abundance of fine pasture grounds, on which the inhabitants breed a prodigious number of cattle, especially horses and camels, besides great herds of sheep and goats.

1. *Cappadocia*, besides the great pasture grounds, produces wines and fruits in great quantities; and the mountains, with which it abounds, especially that long and high chain of them called *Antitaurus*, have mines of silver, copper, iron, and alum. Its chief cities are,

Marasch, which is large and well-built, and drives a good traffic.

Cæsaria, now *Caïsar*, a fair and populous city, the stage of all the caravans of the East, which here disperse to their respective cities. The bazars are handsome and well-stored, and the inhabitants, who are quite polite, drive a considerable trade in cotton.

2. *Armenia the Lesser*, the other province of *Aladulia*, so called to distinguish it from the Greater Armenia, which belongs

longs to Persia, has little or no trade, and is therefore no place of note.

ALAMODE, in commerce, is a thin, light, glossy, black silk, not quilled, or crossed, chiefly used for women's hoods and men's mourning scarfs.

The substance of the several acts of parliament now in force that relate to this article, is as follows:

Alamodes and lustrings may not be imported but into London only; and upon notice first given to the commissioners of the customs, of the quality, quantity, with the marks, numbers, and packages, the names of the importer, the ship, and her burthen, the master, the place where to be laden, and into which they are intended to be imported, and taking a licence under the hands of the said commissioners, or any three of them. 4 and 5 *Will. and Mar. cap. 5. sect. 14.* 9 and 10 *Will. III. cap. 43. sect. 1.*

If they are imported into any other port than London, or without notice, licence, and payment of duty, and not sealed or marked, are forfeited, or their full value. 4 and 5 *Will. and Mar. cap. 5. sect. 14.* 5 and 6 *Will. and Mar. cap. 20. sect. 45.* 9 and 10 *Will. III. cap. 43. sect. 2.*

Upon importation they are to be marked and sealed, and registered in a particular book, by the officers of the customs, before delivered out of the Custom-house warehouse. 5 and 6 *Will. and Mar. cap. 20. sect. 45.* 9 and 10 *Will. III. cap. 43. sect. 2.* If the seals, or marks, are altered, counterfeited, or misapplied, the offenders, and their aiders, &c. are each to forfeit 500l. and to stand in the pillory for the space of two hours. 5 and 6 *Will. and Mar. cap. 20. sect. 45.* 6 and 7 *Will. III. cap. 18. sect. 30.* 9 and 10 *Will. III. cap. 43. sect. 5.*

If they are imported without payment of duty, or being prohibited, or, by way of insurance, delivered, or agreed to be delivered, the importer, contractor, or receiver, may be prosecuted, and a *capias* in the first process, specifying the sum of the penalty may be issued, and the offenders be obliged to give sufficient bail to appear in court, and, at such appearance, must give security to answer all forfeitures and penalties, or else go to gaol. 8 and 9 *Will. III. cap. 36. sect. 1.* 9 and 10 *Will. III. cap. 43. sect. 8.*

If they are fraudulently imported, knowingly received into custody, bartered, or sold, every person concerned, is to forfeit 500l. 9 and 10 *Will. III. cap. 43. sect. 3.*

If they are bought, sold, or harboured, being sealed, or marked, with a counterfeit seal, or mark, the offenders knowing thereof, and not discovering, are to forfeit the goods and 100l. 9 and 10 *Will. III. cap. 43. sect. 5.*

They may be seized within the cities of London and Westminster, and the bills of mortality, only by officers of the customs, or persons deputed by the lustring company, having writs of assistance from the court of Exchequer. 9 and 10 *Will. III. cap. 43. sect. 5.* 5 *Ann. cap. 20. sect. 3.*

When seized, they are immediately to be carried to the Custom-house warehouse in London; and, if forfeited, to be there sold by inch of candle, on condition to be exported, and not to be delivered but in order to be put on ship-board, and until security be given for the due exportation; which security may be discharged by certificate of the chief magistrate of the place where they were delivered, or by oath that they were lost at sea. 8 and 9 *Will. III. cap. 36. sect. 4.* 9 and 10 *Will. III. cap. 43. sect. 2.*

If seized and forfeited, they are not to be consumed in Great-Britain, but must be sold on condition only to be exported. 8 and 9 *Will. III. cap. 36. sect. 4.* 9 and 10 *Will. III. cap. 43. sect. 2.*

In disputes concerning their manufacture or importation, the proof is to lie on the importer, or claimer. 9 and 10 *Will. III. cap. 43. sect. 5.*

Officers conniving at the fraudulent importation of them, or collusively delaying prosecution, are to forfeit 500l. and are rendered incapable of holding any office under his majesty. 9 and 10 *Will. III. cap. 43. sect. 6.*

If they offend a second, or more times, after conviction, they are to forfeit double for each offence. 9 and 10 *Will. III. cap. 43. sect. 7.*

Commanders of ships of war, importing, or knowingly permitting, such goods to be unshipped, besides all other penalties and forfeitures, are to be rendered incapable of serving his majesty. 9 and 10 *Will. III. cap. 43. sect. 4.*

Seamen belonging to such ships, discovering the importation, or unshipping, besides part of the forfeitures, are to be discharged from their service, if desired. 9 and 10 *Will. III. cap. 43. sect. 4.*

Before claim can be entered, the claimer is to give security to pay full costs of suit if he be cast; otherwise, the goods to be forfeited. 9 and 10 *Will. III. cap. 43. sect. 10.* 5 *Ann. cap. 10. sect. 4.*

Information is to be commenced within two years after the offence. 9 and 10 *Will. III. cap. 43. sect. 12.*

Black *alamodes* and lustrings are not to be bought, sold, or dealt in, unless sealed, or marked, at the Custom-house, or by the lustring company, upon forfeiture thereof, and 100l. 6 and 7 *Will. III. cap. 18. sect. 28.*

But if the buyer discovers the feller within twelve months, he is discharged, and is entitled to half the forfeiture of the seller. 6 and 7 *Will. III. cap. 18. sect. 29.*

Black *alamodes* and lustrings, wheresoever manufactured, found without the proper marks, or seals, are forfeited; and the person in whose custody they are found, forfeits 100l. 6 and 7 *Will. III. cap. 18. sect. 28.* 8 and 9 *Will. III. cap. 36. sect. 3.*

The distribution of all penalties and forfeitures is two thirds to the king, and one third to the seizer, or fuer; but the charges of suit and prosecution must be paid out of his majesty's part. 9 and 10 *Will. III. cap. 43. sect. 9.*

ALATERNUS, *the staff-tree*. This genus is by doctor Tournefort placed in his twentieth class of trees and shrubs with a flower of one leaf, whose pointal becomes a soft fruit or berry, inclosing hard seeds. Mr. Ray places it in his class of trees and shrubs bearing berries inclosing several hard seeds.

There are two sorts of the *alaternus*, the broad-leaved, commonly called phillyrea, and the narrow-leaved, deeply sawed on the edges. Some of the Dutch gardeners preserve the latter sort in their green-houses, for the *tea-tree*; and do frequently sell the plants as such to those who are ignorant, or who send to Holland for tea-plants.

Both these sorts grow naturally in Spain, Italy, and the south of France; and have been long inhabitants of the English gardens. They grow to the height of eighteen or twenty feet, and spread their branches pretty wide on every side; so that unless the lower branches are pruned off, the plants will be bushy from the ground upward.

The berries of the narrow-leaved *alaternus*, are gathered in the south of France, and are sent to England by the name of French or Avignon berries, which afford an excellent dye or paint.

These plants flower in April, and their berries are ripe the beginning of September. The birds are so fond of these berries, as to devour them as soon as they are ripe, if they are not gathered, or protected from them.

ALBANIA, a province of Turkey in Europe, lies between Macedonia on the east, and the gulph of Venice on the west, having on the north-east, and north, a chain of mountains, called *Monte-nigro*, or the Black Mountains, which divide it partly from Macedonia, and partly from Servia and Dalmatia. On the south, it is bounded by Epirus, which is sometimes called *Lower Albania*; as the province we are speaking of is stiled *Upper Albania*. Its soil is fruitful, but more towards the north than towards the south, and produces flax, cotton, and excellent wine; as also wax in the woods, and salt dug out of the mountains. The inhabitants make tapestry, which, with the other commodities, they vend abroad. But this country has the same fate of all others under the Turkish dominion, being almost destitute of commerce, and its coast possessed by a kind of pirates, or rovers. Its chief places are,

1. *Scutari*, which is a considerable trading town.

2. *Dulcigno*, situate on the gulph of Venice, may contain 7 or 8000 souls, says Mr. Spon, and is an indifferent good *echelle*, or *scale*, that is to say, in the Levant language,

language, a city of traffic. The Franks have here a consul.

3. *Durazzo*, is a noted sea-port on the coast of the gulph of Venice. The harbour of *Dyrrachium* lies to the north-west of *Brundisium*, now *Brindizzi*, and the passage from the one to the other was easy, so that the former became one of the most considerable towns on the coast of the Adriatic sea. Two circumstances concurred to make it flourish; the one was, that the inhabitants gave every one a full liberty to settle there; whereas the Apollonians, their neighbours, drove all strangers out of their city, after the example of the Lacedemonians. The other was, that most foreigners, who failed up and down the Adriatic sea, used, by the way, to put into this harbour. Messieurs Boudraud, Maty, and Corneille say, that this is still a pretty large town, well fortified, and that it has a good harbour: whereas Messieurs Spon and Wheeler assert, that it is now but a village, with a ruined fort. Thirty miles from *la Valona*, to the southward, there is a mountain, where rises a fountain of pitch, which, being mixed with tar and water, serves to careen vessels.

ALBE, a small piece of money in Germany, worth eight farthings of that country, or two creutzers; that is, about one penny sterling.

ALBERNUS, a stuff resembling camblet, manufactured in the Levant.

ALBUM GRÆCUM, the white dung of dogs. This dung was formerly much used in medicine, particularly mixed with honey to cleanse the throat in inflammations; but it is now rarely used.

ALBUS, a small coin, or halfpenny, current in Cologne, and in the countries of the Lower Rhine. Four *albus*es make four and a half creutzers, or a simple *blasfart*, according to the regulations of the empire.

ALCAHEST, in chemistry, an arbitrary word, derived from no language, but coined by Paracelsus to express an universal menstruum, or solvent, as Helmont explains it.

The illustrious Boerhaave, after collecting every thing which has been said by Helmont, and other chemists, with regard to this wonderful liquor, concludes in the following manner: "Perhaps, says he, you may now be willing to know my opinion of this matter, and whether I believe that any of the chemists ever were masters of this grand *arcantum*. To this I freely answer: Van Helmont complains, that the bottle was once given him, but that it was taken away again, and therefore he could not make any experiments with that liquor. And Paracelsus does not say so many, and so great things of his solvent, and therefore I really do not know what to say to it. This, however, I will venture to say, that if you examine sea-salt and mercury by every chemical method possible, you will never repent of your trouble."

Van Helmont had another menstruum, which he called *circulatum minus*. This is said to be prepared by a circulation of nine weeks, from equal parts of spirit of urine rectified three times, alcohol, and spirit of vinegar twice rectified. This menstruum must doubtless be capable of performing surprising things; especially as we know that neutral menstrooms, like this, will act upon some very hard bodies, which are not otherwise dissoluble, by either acid, alkaline, or spirituous menstrooms.

ALCALI, or ALKALI, a name used by the chemists to express a body, which is esteemed the reverse of an acid. The word is borrowed from the Arabians, who gave this name to a salt extracted from the ashes of a plant, which they called *kali*; but we call it *glass-wort*, because it is used in making glass.

The plant *kali*, if burnt, when it arrives at its full growth, produces ashes remarkable for their salt, acrid taste, an evidence of its abounding with salt. When these ashes are boiled in water, they yield a strong, acrid, salt lixivium, or lye, consisting of the salt communicated by them to the water, which being properly separated, there remains a greyish part, which will neither dissolve in water, nor burn in the fire, but is perfectly insipid, and of the nature of earth. If this lixivium, or lye, is evaporated to a dryness in an iron vessel, a white solid mass, of a most acrid caustic taste, and perfectly soluble in water, is left behind. All these salts, there-

fore, are properly enough called lixivious salts. By terms, however, already received, they are called *alkalies*, or *alkaline salts*. From this salt, and the calx of all stones that strike fire with steel, may be prepared *frit* for the making of glass.

As all our physical knowledge depends upon the discoveries which our senses make in natural bodies, hence all their characteristics must be taken from such sensible signs: nor are we able to distinguish bodies in any other manner. The following characters, therefore, of an *alkali* may be laid down as genuine, and are abundantly sufficient both for the chemist and the philosopher.

1. A fixed *alkaline* salt is produced from a vegetable substance.
2. It is only prepared from a vegetable by fire, which converts it into ashes.
3. When it is thus prepared, it will remain a considerable time in the fire, and thus demonstrate its fixidity.
4. In a moist air it perfectly dissolves, and deposits some scæces, being impatient of continued dryness, though carefully preserved in a close vessel.
5. It impresses an acrimonious taste on the tongue, somewhat caustic; and it excites a taste of urine, on which account these salts have, though not very properly, been called urinous salts: for the taste of this salt does not resemble that of urine, at the first application; but when it has been in the mouth some time, and, by its stimulation, causes a discharge of the saliva; then the neutral animal salts, which are in the saliva, deposit all their acid upon the fixed alkali, and thus become volatile and alkaline, and then impress upon the tongue a disagreeable-urinous taste, of which this is the true origin.
6. This salt, when perfectly pure, and without mixture, has not the least smell, being extremely fixed, even in the fire. But as it attracts every acid; if it meets with any body, which contains a volatile *alkaline* salt, fixed by an acid, and therefore without any smell, it then immediately absorbs the acid, and the alkali being by this means disengaged, and rendered volatile, affects the organs with an *alkaline* smell, which is falsely ascribed to the fixed salt. This appears evidently upon mixing a fixed *alkaline* salt with warm fresh urine, upon which the liquor that was inodorous before, instantly emits a disagreeable *alkaline* smell.
7. Another property of this salt is, that when mixed with any acid whatever, it immediately produces an ebullition and effervescence; and, afterwards, is so intimately united with it into one mass, that if the saturation is complete, the compound discovers no sign either of an *alkali* or an acid; but there is always, by this means, produced a salt of another nature, which is usually called *neutral*.
8. If a pure fixed *alkaline* is mixed with the juice of turnsole, roses, or violets, it presently changes their natural colour, which is a kind of purple, into a green.
9. When this *alkaline* salt is applied for some time to a human body that is warm, and, consequently, exhales some moisture, it excites an acute inflammation, attended with all its symptoms, which soon becomes a grey, hard, dead, and often black scæar; it is therefore capable of producing, at last, a true mortification.
10. All these salts have the faculty of deterging and cleansing, which is not the case with regard to those called neutral. These, then, are the marks by which fixed *alkaline* salts may be known and distinguished from all others; and these will enable us to avoid confusion.

Such *alkaline* fixed salts may also be produced from any crude, fresh vegetable, burnt to ashes, and treated in the manner above-mentioned; but some plants, by this management, yielded but a very small quantity.

No native salts have yet been discovered, with which the preceding characteristics agree, (unless the Egyptian nation may be supposed to do it) *alkaline* salts being procured from vegetable substances only, by the action of fire. Ever since the first calcination of vegetables that happened in the world, these salts have been produced. Hence, therefore, in all ages and places, where this has happened, there must have been a prodigious quantity of this salt generated, which always is, together with the ashes, returned to the earth. In the revolution, therefore, of such a number of years, the whole earth must have been converted into this salt, provided it was immutable. But this is not the case, for these salts, when committed

committed to the earth, render it indeed fruitful, but then they lose their *alkaline* nature, and imbibing the acid of the air, become neutral salts, and act as such. It is farther remarkable, that no plants whatever, if suffered to grow dry, carious, and rotten, will ever yield one grain of a fixed *alkali*; but, on the contrary, they are either dissipated into such minute, volatile particles, as escape the observation of our senses, or leave behind them a substance, which, upon examination, appears to be merely earth. This experiment, therefore, confirmed universally in all ages, evidently demonstrates, that nature never produces a fixed *alkaline* salt, either in the solids or fluids of vegetables. Hence it is certain that fixed *alkaline* salts have their specific nature imparted to them by fire, and not by any natural vegetable operation. But this is still farther evinced by the following experiment, which constantly succeeds in the same manner: take any vegetables, which, if burnt would yield a large quantity of a fixed *alkaline* salt; let them be reduced to putrefaction by art, so that their whole substance shall be perfectly putrified; they will then be rendered exceedingly foetid, and a great part of them volatile, and if they are burnt in an open fire, will not yield the least portion of a fixed salt, but what remains will be a perfectly insipid earth. If therefore we view this experiment in a just light, we must be of opinion, that fixed *alkaline* salts are as much the creature of fire as glass, which nobody ever suspected to be a vegetable production, though vegetable *alkaline* salts enter its composition, and are necessary to its existence.

It must also be remembered, that these *alkaline* salts are capable of being resolved into a considerable part that is saline, hard, bitter, and almost vitrescent; into a simple earth, and into an *alkaline* salt, that is stronger and more pure; and thus we may observe that these *alkaline* salts are by no means simple bodies; but that they are compounded of different parts united together, and that the conjunction of their principles into one mass, which has the appearance of being homogeneous, is owing entirely to the strength of the fire. Hence then it follows that nature never acts by fixed *alkaline* salts, as by her proper instruments, unless when she receives them previously prepared by the fire.

Hence it also appears, that as these fixed *alkaline* salts are rendered more and more simple by a separation of their constituent parts, the salt that thus arises will be continually different; for that which remains after a separation of some of its principles will always be of another, and more simple nature, and consequently will have a different power of acting. Thus in pot-ash, which yields the best *alkali*, a considerable part of it is a bitter, hard, pellucid salt, which does not readily dissolve in water. If this be carefully separated from the rest, a pure *alkali* is obtained, fitter than the former, before this separation, for many operations which are performed by *alkalies*.

It is further to be observed, that these *alkaline* salts may be greatly altered by the casual admixture of some other body, whilst the vegetables are burning, which, being also of a fixed nature, may be united with them, and remain in the ashes. Suppose, for instance, that nitre should happen to come among them; then this, being fixed with the other vegetable salt, would produce an *alkali*, to which, if oil of vitriol was added, it would emit a foetid fume, that would in smell resemble spirit of nitre, which never is the case when the *alkali* is pure. The same is true with respect to sea-salt, and many others. And, lastly, we must observe, that the very burning of vegetables, as it is performed in a different manner, will produce different salts; for it is a known truth, that if the same vegetable is burnt suddenly, in a brisk, strong fire, it will yield a salt different from what is produced by burning it in a slow smothering fire.

Properties of fixed Alkaline Salts.

1. They attract water very powerfully, at a great distance, and from every known body in which it resides. This is plain to the eye; for when such an *alkali* is taken out of the fire, and suffered to remain in a very hot air close to the fire, where water can by no other art be discovered, it will even there grow moist and dissolve; and

if it is then put into a clean, dry, glass-vessel, and exposed to the fire, and the vapour exhaling from it received and condensed in an alembic, it will yield again the pure water which the *alkali* had attracted.

2. It has not yet been determined with any degree of certainty, whether fixed *alkaline* salts repel air, or attract it so strongly, as not to part with it again readily. Experiments which have been made with this view, leave the thing dubious. It is very certain, that oils of *alkaline* salts *per deliquium*, examined by the air-pump, give not the least indication of containing air, since none is to be separated from it, when the pressure of the atmosphere is taken away, even though the oil be made very hot, in order to expel the air. On the contrary, it is equally certain that when *alkaline* oils *per deliquium* are mixed with oil of vitriol, from which the air has been previously extracted by the air-pump, a surprising quantity of elastic air is produced, or, as it is called, generated. Upon considering these circumstances, it appears most probable, that fixed *alkaline* salts actually attract air, and unite it with themselves so strongly, that it is not to be separated, till the texture of the salt is destroyed by the effervescence upon mixing it with an acid.

3. These pure, acrid, fixed, *alkaline* salts, if they are mixed with the purest alcohol, when they come very hot out of the fire, attract it, and unite with it; but if there is the least mixture of water, either in the salts, or alcohol, then the salts repel the alcohol, nor can they be united by any art whatever.

4. These *alkaline* salts act also upon vinous spirits in another manner; for as every spirit drawn by fire, from wine of any sort, has always a volatile acid mixed with it, the acid being greedily attracted by the *alkaline* salt, the spirit, by this means, becomes much more pure, when freed from the acid which adhered to it, and consequently will be very different, both in its nature and virtues, from what it was before this operation.

5. Fixed *alkaline* salts are easily united with the oils of animals and vegetables, whether obtained by distillation or expression.

6. But *alkaline* salts remarkably attract all kinds of acids whatsoever, whether animal, vegetable, or mineral, and that whether dry or moist, pure or diluted. And this force with which *alkalies* attract acid is infinitely greater than that with which they attract water; for in this action by which they unite these acids with themselves, they violently expel the air which resides both in the salt and acids, whence arise such numbers of air-bubbles, which suddenly rise and burst. This union also makes them repel even water: and when they are thus saturated, they will easily suffer themselves to be dried, or deprived of their water, which before they retained so tenaciously.

The violent ebullition and effervescence, that appear upon the mixture of an *alkali* and an acid, whilst the air and water are forcibly expelled, may possibly arise, because these bodies impetuously drive out whatever lies betwixt them, when they rush strongly into mutual contact: and if so, this ebullition and effervescence do not arise from any disagreement, but from an association of principles.

From what has been said, it appears, that among natural causes, by which motion is excited in the universe, we must reckon *alkalies* and acids, at the time when they are mixed together, which motion ceases as soon as ever the combination is completed.

The motion, thus excited, seems of considerable importance in vegetation, or rather in preparing the earth for it. People concerned in husbandry are sensible, that frequent plowing or digging the earth mellowes it, as they call it, renders it fertile; or, to speak more philosophically, disunites the parts of the earth, which otherwise cohere together, and form large glebes, and reduces them into small particles, better suited to the subsequent solution they are to undergo, in order to the production of a plant. Now when the earth is once furnished with an *alkaline* salt, and that is intimately united with the earthy particles, which soon happens, because these salts attracting the water floating in the air, run into an oil *per deliquium*, and sink into the ground; the same salts will attract also the acid of the air, till they are saturated, and both rendered neutral. Whilst, therefore, this neutralization is effecting, an effervescence is made leisurely and by degrees,

greens, as the *alkaline* salt imbibes the acid. Hence motion is excited in the parts of the soil which were impregnated with the *alkali*, and by this motion the particles of the earth are separated from each other, more effectually than either by plowing or digging. This separation is an excellent preparative for a future solution, and, indeed, is one step towards it, since the solution of a body is only reducing it into particles fine enough to float in the medium that dissolves it, and small enough to be transparent, and, consequently, invisible.

Besides the *alkaline* salts already taken notice of, there are others which are volatile, that is, which are capable of being forced by a considerable heat from the body which contains them, and which afterwards arise with a very small degree of heat. The most remarkable among these are animal salts, which may be produced by distillation from every animal substance we are acquainted with. Thus hartshorn, blood, silk, and cobwebs, yield it in great plenty.

Some time since the hypothesis of *alkali* and acid was in great esteem. Tachenius and Sylvius de la Boe were the great defenders of this system. They asserted that *alkalies* and acids were the only universal principles of all bodies; and from hence they accounted for all the phenomena of nature, particularly those of the animal economy. But this, like all other imaginary structures, fell to the ground, when experience demonstrated that it was false and insignificant. It was, however, of some service to physic; because it demolishes the Galenical doctrine of the four elements, four qualities, four degrees, and four humours, which had been the more fatal, as it had obtained credit for a great many centuries, and prevented other researches into the nature of diseases and remedies, and, consequently, had retarded the improvement of physic.

ALCALIZATION, in *chemistry*, signifies the impregnating any body with an alkaline salt, as spirit of wine, &c.

ALCANNA, a drug used in dyeing, which comes from Egypt, and from some other parts of the Levant. The botanists of the latter century called the plant which produces this dye *ligustrum Egyptiacum*, or Egyptian privet; but they were mistaken: it is not a species of that kind.

The colour, which is extracted from its leaves, is red, or yellow, according as it is prepared. It is yellow, if the leaves are put to soak in water; and red, if put into vinegar, citron-juice, or alum-water.

The oil that is extracted from the berries of the *alcanna* is of an agreeable scent, and of some use in physic, especially for softening the fibres. It is called also oil of *Cyprus*, and the plant sometimes *Cyprus*. See **ANCHUSA**.

ALCAVALA, a custom-house duty paid in Spain, and in Spanish America. It is a duty of import, at the rate of 5 per cent. of the price of merchandizes.

ALCEA, *Vervain Mallow*. This genus of plants is by Doctor Tournefort ranged in his sixth section of his first class of plants, intitled, "Herbs with a Bell-shaped Flower of One Leaf; from the bottom whereof there arises a tube that receives the pointal, which changes to a fruit consisting of many cells." Doctor Van Royen gives the title of *columnifera* to this class of plants, because the parts of generation are joined in form of a column in the center of the flower.

The distinction between *alcea* and *malva*, according to Caspar Bauhin, Ray, Tournefort, and most of the botanists of the last century, is in the leaves of the *alcea* being deeply cut and jagged, somewhat like those of the vervain; and this hath occasioned the English title of *vervain mallow*.

The *alcea vulgaris major*, C. B. P. is the species which is ordered to be used in medicine; but that sort is not very common to be met with in England; that which grows naturally near London is the *alcea tenuifolia crispa*. J. B.

It is seldom used in medicine; but the virtues are generally supposed to be nearly the same as those of the common mallow, but less emollient.

ALCHEMY, that branch of chemistry which relates particularly to the transmutation of metals. The Arabic augmentative particle *al*, added to it, distinguishes it from the vulgar chemistry. See **CHEMISTRY**.

ALCHIMILLA, *lady's mantle*. This genus of plants

is by Dr. Tournefort ranged in the second section of his fifteenth class, intitled, "Herbs with Staminate Flowers, whose Pointal becomes a Seed inclosed in the Empalement."

In the North of England it is called *bear's-foot*, being the sort that is called the *alchimilla vulgaris*, or common lady's mantle, and grows naturally on moist meadows in many parts of England, but especially in the northern counties. It flowers in May and June: the roots are perennial, and spread very wide, when they are in a moist soil: the leaves grow upon slender pedicles, arising from the root: the flower-stems rise about a foot high; and are clothed with leaves of the same shape with those below, but smaller, one coming out at every joint of the stalk: the flowers are produced in clusters at the top, which are green, but the summits are of a yellow colour.

This plant is esteemed as a good vulnerary, being drying and binding: it is frequently prescribed in wound-drinks. The leaves of the plant are chiefly used; and these are brought over from Switzerland, mixed with their common vulnerary herbs.

ALCOHOL, in *chemistry*, spirit of wine brought by art to the highest degree of strength and perfection. The word is originally Arabic, and should be wrote *Al-Ka-Hol*, which signifies a fine impalpable powder which the women of the East make use of as a kind of fucus: and hence the word has been applied to any other substance reduced to the utmost degree of purity, and from which all impure and heterogeneous particles have been separated.

Alcohol is the most complete and perfect production of vegetable fermentation. See **FERMENTATION**.

It is the lightest fluid next to air, perfectly transparent, very thin, most simple, totally inflammable, without producing any smok, or diffusing any disagreeable smell whilst it is burning; is exceedingly volatile, without leaving any fœces; absolutely immutable in distillation; extremely expansible by heat; very easily disposed to ebullition by fire; of a very pleasant smell, and of a particular grateful taste. All the humours of the human body we are acquainted with, it coagulates in an instant, except the pure water and urine, whilst it hardens all the solid parts, and thus preserves both from putrefaction, or spontaneous colliquation: it preserves the bodies of insects, fish, birds, and other animals that are put into it, from putrefaction, or alteration for ages, if closely stopped: with water, vinegar, or any acid liquors, oils, and pure volatile alkaline salts, it suffers itself to be mixed, and that nearly with an equal mixture, and gummy and resinous substances it dissolves. So that we are acquainted with no fluid, produced either by nature, or the art of chemistry, that is capable of being united with more bodies than *alcohol*. But in a particular manner it proves an excellent vehicle for the *spiritus rector* of vegetables, which, by uniting with it, may be extracted from its proper body, retained, and applied to medicinal and other uses. The great masters of chemistry, distinguished by the title of adepts, are supposed, in their description of the artificial preparation of this perfect *alcohol* to have shadowed out the preparation of the philosopher's stone: but it is certain, that this *alcohol* owes its origin to fermentation alone; nor can it be prepared in any other manner whatsoever.

As there are infinite, and oftentimes very inviting occasions in which chemists and other artificers stand in need of the true and purest *alcohol*, the least remainder of water rendering the operation unsuccessful, it is absolutely necessary we should have some marks by which we may be able to distinguish, whether our *alcohol* be pure or not. The principal of these are,

1. If the supposed *alcohol* contains any oil dissolved in it, and so equally distributed through it, that it is no ways perceptible, then upon pouring of water into it, the mixture will grow white, and the oil separate from the *alcohol*.

2. If any thing of an acid lies concealed in *alcohol*, a little of it mixed with the alkaline spirit of sal ammoniac will discover the acid by an effervescence excited by the affusion of the acid; for otherwise there would be only a simple coagulation.

3. If there be any thing of an alkali intermixed, it will appear by the effervescence excited by the affusion of an acid.

4. But

4. But it is a matter of great difficulty to discover whether there be any water intermixed with it. The best method of doing this is the following: take a chemical vessel with a long narrow neck, the bulb of which will hold four or six ounces of *alcohol*. Fill this two thirds full with the *alcohol* you intend to examine, into which throw a dram of the purest and driest salt of tartar, coming very hot out of the fire; then mix them by shaking them together, and set them over the fire till the *alcohol* is just ready to boil. Being thus shaken and heated, if the salt of tartar remains perfectly dry, without the least sign of moisture, we are sure that there is no water in the *alcohol*. The learned Boerhaave tells us that by this method he discovered water in *alcohol* which had been looked upon as pure, having undergone every other method of trial.

ALDERMAN, hath the same signification as *senator*, or *senior*, or *elder*; and was the same among the Saxons as *earl* among the Danes. *Camb. Brit. fol. 107*. But at this day, and long since, those are called *aldermen* who are associates to the civil magistrate of a city or town-corporate. *Stat. 24 Hen. VIII. cap. 13*. An *alderman* ought to be an inhabitant of the place, and resident where he is chosen; and if he removes, he is incapable of doing his duty in the government of the city or place, for which he may be disfranchised. *4 Mod. Rep. 36*. *Alderman Langham* was a freeman of the city of London, and chosen *alderman* of such a ward, and being summoned to the court of *aldermen* he appeared, and the oath to serve the office was tendered to him, but he refused to take it, in contempt of the court, &c. whereupon he was committed to Newgate; and it was held good. *March Rep. 179*. The *aldermen* of London, &c. are exempted from serving inferior offices; nor shall they be put upon assizes, or serve on juries, so long as they continue to be *aldermen*. *2 Cro. 585*. In *Spelman's Glossary*; we find that we had anciently a title of *aldermannus totius Angliæ*; witness this inscription on a tomb in Ramsey abbey, *His requiescit D. Alwinus, inclyti Regis Eadgari cognatus, totius Angliæ aldermannus, et bujus sacri cænobii miraculosus fundator*. See *Spelman's Glossary* at large on this word.

Alderman was one of the three degrees of nobility among the Saxons: *etheling* was the first, and *thane* the lowest; but *alderman* was the same as our earl. The word was disused in the latter ages of the Saxons, and in its place the word earl was introduced. It is certain that it was used in king Athelstan's reign. It is true, it literally imports no more than elder; but amongst the Saxons it signified a duke, an earl, a nobleman, and sometimes a general; but then he was called *heretoga*, viz. *Mercna heretoga, alderman of Mercland*; which title he had in relation to his military power: but the title *alderman* shewed his civil jurisdiction; which title afterwards was applied to a judge; as in the reign of king Edgar, Alwin, the son of Athelstan, is called *aldermannus totius Angliæ*, that is, as *Spelman* tells us, *justiciarius Angliæ*.

There was likewise *aldermannus hundredi*: which dignity was first introduced in the reign of Henry I.

At present the *aldermen* are associated to the mayor, or civil magistrate, who form a kind of council, and regulate matters according to the policy of the place: sometimes they also take cognizance of civil and criminal affairs, but this is only in particular cases. Their number is not limited, being in some places six, and in others twenty-six, out of which the mayor or chief magistrate is annually chosen, who, at the expiration of his mayoralty, becomes again an *alderman*.

ALE, a well-known liquor in England, made of m.l.t.

What chiefly distinguishes *ale* from *beer*, which is made from the same ingredients, is the quantity of malt and hops used in it, there being more put into *beer* than into *ale*; wherefore the former is stronger and more bitter, and will keep longer.

The duties on *ale* and *beer* make a principal branch of the revenues in England. They were laid the twelfth year of Charles II. and have been continued by several subsequent acts of parliament to the present time.

By stat. 12 Car. II. cap. 23. sect. 1. there was to be paid to his majesty during life,

For every barrel of *beer* or *ale* above 6s. the barrel, brewed by any person who shall sell *beer* or *ale*, to be paid by the brewer, 1s. 3d.

For every barrel of 6s. *beer* or *ale*, brewed as aforesaid, 3d. continued for the life of his majesty, by 1 Geo. II. stat. 1. cap. 1.

By stat. 12 Car. II. cap. 24. sect. 15. there was to be paid unto the king, his heirs and successors for ever, as a part of the recompence for the tenures and purveyance taken away,

For every barrel of *beer* or *ale* above 6s. the barrel, brewed by any person who shall sell *beer* or *ale*, to be paid by the brewer, 1s. 3d.

For every barrel of 6s. *beer* or *ale*, or under, brewed as aforesaid, 3d. Confirmed 13 Car. II. cap. 7.

By stat. 4 Will. and Mar. cap. 3. sect. 2. there was to be paid unto their majesties, during ninety-nine years, for *beer* and *ale*, by way of excise, above all other duties,

For every barrel of *beer* or *ale* above 6s. the barrel, exclusive of excise, brewed by any person who shall sell *beer* or *ale*, to be paid by the brewer, 9d.

For every barrel of *beer* or *ale* of 6s. the barrel, or under, 3d.

For every barrel of *beer*, *ale*, or *mum*, imported from beyond seas, to be paid by the importer before landing, 3s.

Made perpetual 1 Geo. I. cap. 12. sect. 8. and the surplus, together with that of the duties on cyder, perry, brandy, spirits, and metheglin, as expressed in the same act, appropriated to the aggregate fund.

By stat. 5 Will. and Mar. cap. 20. sect. 10. there was to be paid unto their majesties, for *beer* and *ale*, one moiety of the duties of excise granted for four years, by 2 Will. and Mar. cap. 10. (viz.)

For every barrel of *beer* or *ale* above 6s. the barrel, exclusive of excise, brewed by any person who shall sell *beer* or *ale*, to be paid by the brewer, 9d.

For every barrel of *beer* or *ale* of 6s. the barrel, or under, 3d.

For every barrel of *beer*, *ale*, or *mum*, imported from beyond sea, Guernsey, or Jersey, to be paid by the importers before landing, 3s.

Five sevenths of this duty, and also of the duty on cyder, perry, brandy, &c. as is expressed in the same act, appropriated to make good a fund to the Bank, and two sevenths to pay annuities; and the surplus to the aggregate fund, 1 Geo. I. cap. 12.

By stat. 4 Ann. cap. 6. sect. 6. From the 17th of May, 1713, there was to be paid unto her majesty during the term of thirty-five years for *beer* and *ale*, above all duties imposed by former acts.

For every barrel of *beer* or *ale* above 6s. the barrel, exclusive of excise, brewed by any person, who shall sell *beer* or *ale*, to be paid by the brewer, 9d.

For every barrel of *beer* or *ale* of 6s. the barrel, or under, 3d.

For every barrel of *beer*, *ale*, or *mum*, imported from beyond sea, or from Guernsey, or Jersey, to be paid by the importers, before landing, 3s.

These duties, together with those on cyder, perry, brandy, &c. as expressed in the same act, charged with annuities, and by 1 Geo. I. cap. 12. are made perpetual, and part of the aggregate fund. The South-Sea company are impowered to purchase the annuities, by 6 Geo. I. cap. 4.

By stat. 8 Ann. cap. 7. sect. 1. From the feast of the Annunciation, 1710, there was to be paid unto her majesty during the term of thirty-two years, for *beer* and *ale*, above all duties by former acts imposed,

For every barrel of *beer* or *ale* (above 6s. the barrel, exclusive of excise) brewed by any person who shall sell *beer* or *ale*, to be paid by the brewer, 3d.

For every barrel of 6s. *beer* or *ale*, or under, 1d.

By sect. 3. For the barrel of two-penny *ale*, described in the seventh article of the treaty of union, there was to be only paid, by virtue of this act, such a proportionate part of 3d. as 2s. bears to 4s. 9d. above the other duties charged in the said articles.

Made perpetual by the South-Sea act, 6 Geo. I. cap. 4.

Officers of the customs are to charge masters of ships, in their victualling bills, with no more than is sufficient for the voyage. 1 *Will. and Mar. cap. 22. sect. 2.*

An additional duty of 3s. per barrel is, by an act 1 *Geo. III.* granted on all beer or ale above 6s. the barrel, brewed for sale in England; to commence on the 24th of January, 1761: and a proportional duty is to be paid for every barrel of two-penny ale, brewed for sale in Scotland. All the powers, rules, and directions, &c. established by an act of the 12th of Charles II. or by any other act now in force relating to the duties of excise, are extended to the duties granted by this act.

Beer brewed before the said 24th of January, if at any time thereafter mixed with any fresh guile or brewing, is to pay the additional duty. A draw-back of 8s. per barrel is to be allowed by the commissioners of excise on all beer and ale, brewed after the said 24th of January, and exported to foreign parts, the proper officer delivering a certificate of the quantity exported, and of the duties having been duly paid; and withal deducting 3d. per tun for charges of the officers. A bounty of 1s. per barrel is to be paid by the commissioners of excise on all strong beer and ale exported, for which duties have been paid, brewed, after the said 24th of January, from malted corn, when barley is at 24s. per quarter, or under. The duty is likewise to be paid for strong beer or ale spent on ship-board. All powers, rules, methods, and directions, in an act of the 33d *Geo. II.* with respect to the draw-back and bounty thereby allowed on exportation of British-made spirits, and the preventing of frauds therein, are to be in force, and, with respect to the draw-back and bounty, &c. payable under this act, except such parts as relate to the size of the casks and burden of the ships or vessels.

Fines, penalties, and forfeitures, are to be levied and applied according to law. The amount of the new duties is to be distinguished in the officer's accounts, and to be paid into the exchequer separately from all other duties, &c. And these duties are appropriated for the payment of the annuities, chargeable on the monies borrowed on the credit of this act.

GILL-ALE, a kind of medicated drink, prepared by infusing the dry leaves of ground-ivy in malt-liquor, by which means it becomes impregnated with the virtues of the simple. There are several other medicated liquors, which may be seen in Quincy's Dispensatory.

ALE-CONNER, an officer in the city of London, whose business is to take care that the measures in public-houses are just.

ALE-SILVER, a rent or tribute annually paid to the lord mayor of London, by those that sell ale within the liberty of the city. *Antiq. Purvey. 183. Cowel.*

ALE-TASTER, is an officer appointed in every court-leet, sworn to look to the affize and goodness of ale and beer, &c. within the precincts of the lordship. *Kitch. 46.* where may be seen the form of his oath.

ALEHOUSES. Before the statute of 5 and 6 *Ed. VI. cap. 25.* it was lawful for any one to keep an alehouse without licence; for it was a means of livelihood, which any one was free to follow: but if it was disorderly kept, it was indictable as a nuisance. 1 *Salk. 45.*

The ancient, true, and principal use of inns, ale-houses, and victualling-houses, was for the receipt, relief, and lodging of way-faring people travelling from place to place, and for such supply of the wants of such people as are not able by greater quantities to make their provision of victuals, and not meant for entertaining and harbouring of lewd and idle people, to spend and consume their money and their time in a lewd and drunken manner. *Preamble to Stat. 1 Jac. I. cap. 9.*

Stat. 5 Ed. 6. cap. 25. sect. 1. The justices of peace in every shire, city, and borough, town corporate, franchise or liberty, or two of them (whereof one to be of the quorum) shall have power to put away common selling of ale and beer, in common alehouses and tipling-houses, where they shall think meet. And none shall keep any common alehouse or tipling-house, but such as shall be thereunto admitted in the open sessions of the peace, whereof one to be of the quorum. And the justices shall take bond and surety from time to time, by recognizance, of such as shall be admitted to keep any

common alehouse or tipling-house, as well against the using unlawful games, as also for the maintenance of good order. For making of which recognizance, the party shall pay but twelve-pence.

Sect. 2. The justices shall certify the recognizance at the next quarter-sessions, there to remain of record before the justices, upon pain of forfeiture for every such recognizance taken and not certified, three pounds six shillings and eight pence.

Sect. 3. The justices of peace where such recognizance shall be taken, shall have power, in their quarter-sessions, by their discretion, to inquire of all such persons as shall be admitted to keep any alehouse or tipling-house; and that he be bound by recognizance, if they have forfeited the same recognizance. And the justices shall, upon every such presentment, or information, award process against such person, to shew why he should not forfeit the recognizance, and shall have power to hear and determine the same.

Sect. 4. If any person, other than such as shall be admitted by the justices, shall obstinately take upon him to keep a common alehouse or tipling-house, or shall, contrary to the commandment of the justices, or two of them, use commonly selling of ale or beer; the said justices, or two of them (whereof one to be of the quorum) shall commit such person to the common gaol, there to remain three days. And before his deliverance, the justices shall take recognizance of him, with two sureties, that he shall not keep any common alehouse or tipling-house, or use commonly selling of ale or beer.

Sect. 5. The justices shall make certificate of every such recognizance and offence at the next quarter-sessions, which certificate shall be a sufficient conviction. And the justices, upon the said certificate made, shall in open sessions assess the fine for every such offence at twenty shillings.

Sect. 6. In such places where any fair shall be kept, for the time only of the fair, it shall be lawful for every person to use common selling of ale or beer in booths, or other places there.

The first section of the foregoing statute must be understood of unlicensed houses only. 1 *Salk. 46.* And by the same section, the justices in their sessions have power to suppress such unlicensed alehouses, and need not proceed by information or conviction; but they have thereby a discretionary power to suppress them, without shewing any cause or misdemeanor. *Lord Raymond 1303.*

There is a difference between suppressing an unlicensed alehouse, and one that is licensed. Where an alehouse is licensed, the justices, to suppress it, must either proceed upon the recognizance, the condition whereof must at least be broken; and therefore his having another trade, or being a bailiff, can be no cause in such case: or by indictment, and then there must be such disorders as prove a nuisance. But where an alehouse is unlicensed, the justices may suppress it at discretion; for on the denial of a license no appeal lies, and this statute, which gives the justices a power to suppress where they should think meet, would signify nothing if it did not extend to such cases; for it cannot extend to alehouses that are licensed, because they are not punishable without a breach of the recognizance. And to those that are unlicensed, if they be suppressed, the want of a license can only come in question in such case, and not the reason and cause why it was denied. 1 *Salk. 45, 46.*

Stat. 4 Jac. I. cap. 4. No person shall sell any beer or ale to any person, that then shall sell beer or ale as a common tipler or alehouse-keeper, the same person not having any license (other than for the use of his household) upon pain to forfeit for every barrel six shillings and eight pence, and after that rate.

Stat. 3 Car. I. cap. 4. sect. 2. If any person shall, not being licensed, keep a common alehouse, or use commonly selling of ale or beer, cyder or perry, such person shall forfeit twenty shillings to the use of the poor of the parish; the offence being viewed by the mayor, bailiff, or justice of peace, or other head officer, or confessed by the party, or proved by the oath of two witnesses: the said penalty to be levied by the constables or churchwardens, who shall be accountable thereof to the use of the poor; and for default of satisfaction within three days,

days, the distrefs to be appraised and fold, and the overplus to be delivered to the party. And if fuch offender fhall not have fufficient goods, or fhall not pay the faid twenty fhillings within fix days after conviction, then the mayor, bailiff, &c. fhall commit the offender to fome conftable, or other inferior officer, to be openly whipped.

Sett. 3. If any conftable or officer fhall neglect to execute the faid warrant, it fhall be lawful for the mayor, bailiff, &c. to commit the conftable or officer to the common gaol, until the faid offender fhall be by the faid conftable or officer, or by his procurement, punifhed and whipped, or until he fo neglecting fhall have paid forty fhillings to the ufe of the poor of the parifh.

Sett. 4. If the offender, being an unlicenced alehoufe-keeper, fhall offend the fecond time, then the mayor, bailiff, &c. fhall commit him to the houfe of correction for one month. And if fuch perfon fhall again offend, he fhall be committed to the houfe of correction until by the order of the juftices, in their general feflions, he fhall be delivered.

Sett. 5. Such offender, as fhall be punifhed by virtue of this act, fhall not be punifhed again for the fame offence by the act 5 and 6 *Edw. 6. cap. 25.* And fuch offender as fhall be punifhed by virtue of the act 5 and 6 *Edw. 6.* fhall not be punifhed again for the fame offence by virtue of this act.

Sett. 6. In places where any fair fhall be kept, for the time only of the fame fair, it fhall be lawful for every perfon to ufe common felling of ale or beer in booths or other places.

Stat. 26 Geo. II. cap. 31. fett. 9. When any juftice fhall fufpect that any alehoufe-keeper, victualler, or retailer, fells ale, beer, cyder, or perry, without licence, it fhall and may be lawful for fuch juftice to call fuch fufpected perfon before him, and alfo any excife-officer or gauger, to produce before fuch juftice his flock-book, or other account, which fuch officer keeps, of the charge or furvey of fuch fufpected perfon, in refpect of any of the liquors aforefaid; and likewife to examine fuch excife-officer or gauger upon oath, touching the manner in which fuch officer furveys or charges fuch fufpected perfon, in refpect of any of the liquors aforefaid, or how, or in what manner fuch fufpected perfon actually pays the duties for any of the faid liquors; if it fhall appear by fuch flock-book or other account, or by the examination of the faid officer or gauger, that fuch perfon fo fufpected, is furveyed as a victualler or retailer, and is charged with the fame duties that victuallers and retailers are actually charged with, and pay for any of the liquors aforefaid, and is not intitled to the allowance or abatement given to common brewers, then, and in fuch cafe, fuch fufpected perfon fhall be deemed an alehoufe-keeper, victualler, retailer, or feller of any of the liquors aforefaid, to all intents and purpofes, as if the fame had been proved by two witneffes.

Sett. 10. And if any perfon fhall make information before any one juftice of the peace, and fhew probable caufe that he fufpects that any perfon fells ale without licence, beer, or other liquors, without a licence from two juftices, it fhall and may be lawful to and for fuch juftice to call fuch fufpected perfon before him, and alfo to fummon any other perfon or perfons as evidence to prove the charge againft fufpected perfon, and if fuch perfon fo fummoned fhall refufe to appear, or, when appearing, fhall refufe to be examined upon oath, and give evidence as aforefaid, fuch perfon or perfons fhall forfeit the fum of ten pounds, to be levied by diftrefs and fale of the goods and chattels of fuch offender or offenders, by warrant under the hand and feal of fuch juftice, rendering him or them the overplus, after charges of the faid diftrefs and fale deducted, to be paid to the overfeers for the ufe of the poor where the offender fhall live.

Sett. 11. And that if any perfon fhall be difabled by conviction to fell ale, beer, cyder, or perry, fuch perfon fhall, by the fame conviction, be alfo difabled to fell any fpirituous liquors or ftrong waters; any licence before obtained for that purpofe notwithstanding, and every licence granted to the perfon fo convicted, to fell ale, beer, cyder, perry, fpirituous liquors, fstrong waters, or any of them, from the time of fuch conviction, fhall be

null and void; and every perfon felling ale, beer, cyder, perry, fpirituous liquors, fstrong waters, or any of them, during the term of fuch difability, fhall be fubject to all, or fuch of the penalties, as are refpectively inflicted by law for felling ale, beer, cyder, perry, fpirituous liquors, fstrong waters, or any of them, by retail without licence; and in all profecutions of fuch offenders, a certificate from the clerk of the peace (or perfon acting as fuch) of any fuch conviction, fhall be legal evidence; which certificate fuch clerk of the peace or perfon fhall grant on demand, without fee or reward.

Sett. 12. And every perfon fo convicted of the offence of felling ale, beer, or other liquors, without a licence from two juftices of the peace, fhall, for every fuch firft offence, forfeit the fum of forty fhillings; and for every fuch fecond offence fhall forfeit the fum of four pounds; and for every fuch third offence fhall forfeit fix pounds; all which faid refpective forfeitures fhall and may be levied by diftrefs, and fale of the goods and chattles of every fuch offender (rendering to him the overplus, after charges of the faid diftrefs and fale deducted) by warrant under the hand and feal of the juftice convicting fuch offender; and fhall be paid one moiety thereof to the informer, and the other moiety thereof to the overfeers of the poor, for the ufe of the poor of the parifh or place where fuch offence was committed; and if no fufficient diftrefs fhall be found, whereon to levy the faid refpective forfeitures, then the faid juftice of the peace fhall and may commit every fuch offender fo refpectively committed as aforefaid, to the common gaol or other prifon, or houfe of correction, within his jurifdiction, without bail or mainprize, for the fpace of one month, for the firft offence; and for the fecond offence, for the fpace of two months; and for the third offence, until fuch offender fhall be difcharged by order of the court of general quarter-feflions.

Stat. 28 Geo. II. cap. 19. fett. 2. Every perfon felling ale, beer, or other liquors without licence, after a third conviction, fhall, for every fuch offence, fo often as it fhall happen, forfeit the fum of fix pounds to be levied and difpofed of in like manner as the forfeitures in the firft, fecond, and third conviction, are directed to be, in and by the faid act; and in cafe no fufficient diftrefs fhall be found, whereon to levy the faid feveral forfeitures, then the juftices of the peace, who fhall have convicted fuch offender, fhall and may commit him or her fo convicted, to the common gaol, or other prifon, or houfe of correction within his jurifdiction, without bail or mainprize, until fuch offender fhall be difcharged by order of the general or quarter-feflions.

Licensing alehoufes, and the requifites upon that occafion.

Stat. 2 Geo. II. cap. 28. fett. 11. Whereas many inconveniencies have arifen from perfons being licenced to keep inns, and common alehoufes, by juftices of the peace, who, living remote from the places of abode of fuch perfons, may not be truly informed as to the occafion or want of fuch inns or common alehoufes, or the characters of the perfons applying for licences to keep the fame. Be it therefore enacted, that from and after the twenty-fourth day of June, one thoufand feven hundred and twenty-nine, no licence fhall be granted to keep a common inn, or alehoufe, or to retail any brandy or fstrong waters; but at a general meeting of the juftices of the peace acting in the divifion where the faid perfon dwells to be holden for that purpofe, on the firft day of September yearly, or within twenty days after, or at any other general meeting of the faid juftices, to be holden for the divifion wherein the faid perfon refides; and all licences which fhall, after the faid twenty-fourth day of June, one thoufand feven hundred and twenty-nine, be granted to the contrary hereof, fhall be null and void.

Sett. 12. Nothing herein contained fhall extend to alter the method or power of granting licences for keeping of common inns, alehoufes, or brandy-fhops, in any city or town corporate.

Stat. 26 Geo. II. cap. 31. fett. 1. Upon granting licences by juftices of the peace to any perfon to keep an alehoufe, inn, victualling-houfe, or to fell ale, beer, and other liquors by retail, every fuch perfon fhall enter into

recognizance to the king's majesty, his heirs, and successors, in the sum of ten pounds, or two sufficient sureties, each in the sum of five pounds, or one sufficient surety in the sum of ten pounds, under the usual condition, for maintenance of good order and rule within the same; and in case the person applying for such licence shall be hindered through sickness or infirmity, or any other reasonable cause, to be allowed by the said justices of the peace, at the meeting of the said justices for granting the said licences, then that it shall and may be lawful for them to grant such licence upon two sufficient sureties entering into such recognizance, each in the penalty of ten pounds, for performance of the condition of the said recognizance; which said recognizance, with the condition thereof, fairly written, or printed, shall forthwith, or at the next general or quarter-sessions of the peace at farthest, after granting such licences, be sent or returned to the clerks of the peace, or persons acting as such for every county, riding, city, liberty, or town corporate, in that part of Great-Britain, called England, wherein such licences shall be granted, under the hands of the justices of peace, before whom such recognizances were taken, to be by the said clerks of the peace, or such other person acting as such, duly entered or filed amongst the records of the peace; and that for every such licence granted without taking such recognizance, and for every such recognizance not sent or returned as aforesaid, every justice of the peace signing such licence shall forfeit 3l. 6s. 8d.

Sec. 2. To prevent disorders in *alehouses*, no licence to keep the same shall be granted to any person not licensed the year preceding, unless such person produce, at the general meeting of the justices in September, a certificate under the hands of their parson, vicar, or curate, and the major part of the church-wardens and overseers, or else of three or four reputable and substantial householders and inhabitants of the parish or place where such *alehouse* is to be; setting forth, that such person is of good fame, and of sober life and conversation; and it shall be mentioned in such licence, that such certificate was produced, otherwise such licence shall be null and void.

Sec. 3. If any person licensed shall die or remove from an *alehouse*, it shall be lawful for the person succeeding to such house, to keep on the said *alehouse* during the residue of the term of such licence, on condition that within thirty days after such death or removal, such person obtain such certificate as aforesaid, to be signed by some neighbouring justice, in order to its being produced at the next general meeting in September; and if such certificate be not so obtained and signed, within the said thirty days, then, immediately from and after the expiration thereof, such licence shall be null and void; and no licence shall intitle any person to keep an *alehouse* in any other place than that in which it was first kept by virtue of such licence, and such licence, with regard to all other places, shall be null and void.

Sec. 4. No licence shall be granted but on the first day of September yearly, or within twenty days after; and such licence shall be made for one year only, and to commence on the twenty-ninth day of the said September; and the day and place for granting such licence shall be appointed by two or more justices acting for the division, by warrant under their hands and seals, at least ten days before such meeting, directed to the high-constable, or high-constables, of the said division; requiring him or them to order his or their respective petty constables, or other peace-officers, to give notice to the several inn-keepers and alehouse-keepers within their respective constablewicks, of the day and place of such meeting; and all licences hereafter granted at any other time or place, shall be null and void, to all intents and purposes whatsoever.

Sec. 5. The clerks of the peace shall keep a register or calendar of all recognizances so sent or returned, and shall deliver, or cause to be delivered to the justices of the peace, at their general meeting in September every year, for granting licences in each division or place, a true copy of such register or calendar; and for every recognizance there shall be paid, by the clerk or clerks of the justices taking such recognizances, to the said

clerks of the peace, as their fee for filing or recording the said recognizance, and for making and delivering copies of the said register or calendar thereof, the sum of one shilling, and no more; which shall be paid to the clerks of the said justices by the persons licensed, over and above the fees payable to the said justices clerks.

Sec. 6. The said forfeitures for granting licences, without taking recognizances, shall and may be sued for, and recovered by action of debt, bill, plaint, or information, in any of his majesty's courts of record at Westminster, for the use of the person or persons who shall sue or prosecute the same, together with costs of suit; wherein no essoin, or wager of law, or more than one imparlance shall be allowed.

Sec. 7. Any justice of the peace of any county, &c. wherein such licence shall be granted, upon complaint or information that such licensed person hath done or committed any act, offence, or misdemeanor, whereby in the judgment of the same justice such recognizance may be forfeited, or the condition thereof broken, may by summons under hand and seal, require such person, so complained of, or informed against, to appear at the next general or quarter-session of the peace for the said county, &c. then and there to answer to the matter of such complaint or information; and also may bind the person or persons who shall make such complaint or information, or any other person or persons, in a recognizance to appear at such general or quarter-session, and give evidence against such person so complained of, or informed against; and the justices of the peace in their general or quarter-sessions, shall have power to direct the jury which shall attend at such sessions for the trial of traverses, or some other jury of twelve honest and substantial men, to be then and there impanelled by the sheriff, without fee or reward, to enquire of the misdemeanor charged in the said complaint or information; and if such jury shall find that the person so complained of, or informed against, hath done any act whereby the condition of his recognizance is broken, such act being specified in such complaint or information, it shall and may be lawful for the court, at such general or quarter-sessions, to adjudge such person guilty of the breach of such recognizance; which verdict and adjudication shall be final to all intents and purposes; and thereupon the said justices shall order the recognizance, entered into by such offender, to be estreated into the Exchequer, to be levied to his majesty's use; and that the said person, the condition of whose recognizance shall be adjudged to be broken and forfeited, shall, from and after such adjudication, be utterly disabled to sell any ale, beer, cyder, perry, spirituous liquors, or strong waters, for the space of three years; and any licence or licences, granted or to be granted to such person during such term, shall be void and of no effect.

Sec. 8. Provided, that the said justices may, at the request of the prosecutor, or party so complained of or informed against, or either of his or her sureties, if they shall see just, adjourn the hearing and trial of the said complaint or information, to the then next general quarter-sessions of the peace, where the same shall be finally determined.

Sec. 13. And every conviction of any offender for selling ale, beer, or other liquors, without such licence, or after being disabled to sell as aforesaid, shall be certified by the justice of peace making the same, to the next general or quarter-sessions of the peace, to be filed or entered amongst the records of the said session; and that such conviction shall and may be drawn up and certified in the following form of words as the case shall happen, or in another form of words to the same effect, *mutatis, mutandis*, that is to say,

Middlesex. A. B. is convicted on his or her own confession (or on the oath of) of having sold ale, beer, or other liquors, in the parish of in this county, on the day of without being licensed thereto, according to law (or, after being disabled to sell, as the case may be). Given under my hand and seal this day of

And there shall be added, that the same is the first, second, or third conviction; which said conviction, in the

same or the like form of words, shall be good and effectual in law to all intents and purposes, and shall not be qualified, set-aside, or adjudged void or insufficient for want of any other form or words whatsoever.

Sec. 14. Provided always, that such offender who shall be punished by virtue of this act, shall not be punished again for the same offence by any former act; and that such offender who shall be punished by virtue of any former act, shall not be punished again for the same offence by virtue of this present act, or any thing herein contained.

Sec. 15. Provided, that this act, or any thing herein contained, shall not in any wise be prejudicial to the privilege of licencing taverns and public-houses, claimed by the two universities of that part of Great-Britain called England, or either of them, nor to the chancellor, masters, and scholars, or any officers of the same, or their successors, but that they may use and enjoy such privilege, as they have heretofore lawfully used and enjoyed; any thing herein contained to the contrary notwithstanding.

Sec. 16. Provided always, that nothing herein contained shall extend, or be construed to extend, to alter the time or times of granting licences for keeping of common inns or *alehouses*, or to oblige persons, not licenced the year preceding, to produce certificates, in any city or town-corporate.

Sec. 17. Provided, that any person shall be deemed a competent witness, and be admitted to give evidence upon any information or complaint for any offence committed against this act; notwithstanding such person be an inhabitant of, or charged or liable to be charged to the payment of any rates or assessments for the relief of the poor of any parish or place, where such offence shall be committed.

By *stat. 26 Geo. II. cap. 13. sect. 12.* no justice of the peace, being a common brewer of ale or beer, inn-keeper, or distiller, or other seller of or dealer in ale, or any kind of spirituous liquors, or interested in any of the said trades or businesses, or being a victualler or malster, shall, during such time as he shall be such common brewer, inn-keeper, &c. or interested in any of the said trades or businesses, be capable, or have any power to grant any licence or licences to any person or persons whatsoever, for selling ale, beer, or any other liquors by retail; and in case any such justice or justices shall grant any such licence, the same shall be null and void.

By the statutes 1 *Ann. stat. 2. cap. 22. sect. 6.* and 6 *Geo. I. cap. 21. sect. 56.* all mayors, town-clerks, and other persons whom it may concern, shall make out ale-licences duly stamped, before the recognizances be taken, on pain of 10 l. half to the king and half to the prosecutor, with costs.

This stamp-duty, by *stat. 9 Ann. cap. 23.* is one shilling; and by *stat. 29 Geo. II. sect. 1.* every licence is charged with a further duty or stamp of 20 s. and by the last-mentioned act, *sect. 20.* if any person shall write any licence without such stamp, he shall forfeit 10 l. with costs, to be recovered as stamp-penalties; and the licence shall not be available till the duty shall be paid, and also a penalty of 5 l.

By *statutes 16 Geo. II. cap. 8. sect. 8.* and 24 *Geo. II. cap. 40. sect. 9.* no person shall retail any distilled spirituous liquors, without a licence from the officer of excise taken out ten days before, for which he shall pay 40 s. yearly. And by *statutes 16 Geo. II. cap. 8. sect. 11.* and 29 *Geo. II. cap. 12. sect. 22.* such persons shall be first licenced to sell ale or spirituous liquors by two or more justices of the peace. And by *statutes 9 Geo. II. cap. 23. sect. 14.* and 24 *Geo. II. cap. 40. sect. 28, 29.* the justice's clerk shall have 2 s. 6 d. and no more for such licence.

Stat. 29 Geo. II. cap. 12. sect. 23. If any person so licenced to sell ale, beer, or other exciseable liquors, shall die or remove from the *alehouse* or other place wherein such ale, beer, or other liquors, shall by virtue of such licence, be sold, it shall and may be lawful for the executors, administrators, and assigns of such person so dying or removing, who shall be possessed of such house or place, or the occupier thereof, to sell ale, beer, or other liquors therein during the residue of the term for

which such licence shall have been granted to the person so dying or removing, without any certificate from any justice of the peace, or any new licence to be had or obtained in that behalf, notwithstanding 26 *Geo. II.*

Sec. 24. In case any *alehouse* shall be empty or unoccupied after the general day appointed for licencing (the occupier whereof was duly licenced the year preceding,) it shall be lawful for any two justices of peace, at a petty sessions, to grant a licence to any new tenant or occupier, to open such house as an *alehouse*, and to sell ale there, till the next general licencing day, so as the said licence be stamped as herein directed.

Sec. 26. Every person who shall retail ale, beer, or other liquors, in any prison or house of correction, or workhouse to be appointed for the reception of poor persons, shall be deemed a keeper of a common *alehouse* or tipling-house, unless he or she shall obtain from the justices of the peace, according to due course of law, a licence to sell such beer, ale, or other exciseable liquor.

ALEGAR, four ale used by the dyers.

ALEMBIC, a chemical vessel for condensing the vapours which arise in distillation. Before the use of retorts became so common as at present, the general way of distilling was, to put the matter to be distilled into a vessel called a body, or gourd, and fit a head to it, in order to receive the vapour, which there condensing into a liquor, is conveyed by a tube, called the rostrum or beak, from the head into the receiver. This head is properly the *alembic*, and is called *alembicus rostratus*, to distinguish it from another sort of *alembic*, called *alembicus cæcus*, a blind *alembic*, which has no pipe or tube, being used to receive substances of a drier nature, which are sublimed into it out of the body. Sometimes, also, the *alembic* is perforated at the top, in order to permit part of the vapour to escape. Thus an *alembic* is properly the head of a distilling vessel, but it is now frequently used to signify the whole apparatus. See *CHEMICAL Laboratory*.

ALENTEJO, a province of *Portugal*, borders on the northern part of *Estramadura*, and of the river Tajo; eastward on the Spanish provinces of *Andalusia* and *Estramadura*; on the west it is bounded by the ocean, and part of the Portuguese *Estramadura*; and on the south by the little kingdom of *Algarve*. This country is reckoned the finest and most fertile of all *Portugal*; and its inhabitants, who are chiefly farmers, are very wealthy and industrious. It abounds not only with corn of all sorts, wine, oil, and fruits, sufficient for its own inhabitants, but likewise supplies some of the adjacent provinces; and this exportation is very much facilitated by a number of rivers, which fall either into the Tajo, or Guadiana, which two last great ones run quite across this province.

At *Elvas*, a city in this province, situate on the banks of the Guadiana, the Portuguese have of late erected a woollen manufactory; and the undertakers of that project imagine, that they shall be able to make a good progress, and to supply themselves with broad-cloths, fine druggets, and other stuffs, such as they have principally from England; they also intend to use all the oil of their own growth in this manufactory. But, as yet, they have only been capable of finishing some coarse and ordinary things, rather worse than the English kerseys, which serve chiefly for the clothing of the poorest of the people.

The inhabitants of *Portalegre*, another city of this province, have likewise made the same attempt as those of *Elvas*, and have succeeded no better hitherto. The country about this place produces a very great quantity of oil.

At *Esfremos* is a curious manufacture of red earthenware, formerly admired in England; and, though now out of fashion among us, is still in great vogue in *Portugal*. The potters that work it are very ingenious, and turn it into a vast variety of curious utensils; such as jars, bowls, tea-pots, and the like.

At *Monte Novo* is another curious manufacture of a particular earthen-ware, especially of cups, pitchers, and drinking-bowls, adorned with bright stones.

ALEPPO, the capital of *Syria Proper*, stands about sixty miles, or twenty-two leagues east from *Scanderoun*, in lat. 36. 30. east longitude 37. 50. It is the greatest

and

and most opulent city in all Syria, and justly esteemed the most considerable in all the Turkish dominions, next to Constantinople and Grand Cairo. It is built upon four hills, on the highest of which stands the castle, in the center of the town, surrounded with strong walls, built of large square stones, and flanked with large towers. This situation both of the city and castle is so healthy, and the air and sky so thin, serene, and delightful, that though the thermometer rises in June to the thirtieth degree, yet the people lie all night on their terraces and tops of houses from May to September without danger, or rather with peculiar pleasure; scarce a cloud being to be seen all that time, but a clear and bright sky over their heads. It has still a much greater advantage from this excellent situation, by being encompassed with a spacious, fertile, and delightful plain; but the greatest advantage it reaps, and that in an eminent degree, is from its convenient situation for commerce. Formerly, by means of its sea-port Alexandretta on the Mediterranean, as well as the gulph of Ormus on the Persian gulph, and the river Euphrates, which there falls into it, the Persians, Armenians, Arabs, and Indians from that side, used to bring to it all their rich merchandizes, consisting of jewels, silks, drugs, spices, and other commodities, which before the discovery of the navigation to the East-Indies, rendered that kind of commerce vastly richer than it has been since. It still, however, continues to be the mart for the richest commodities of Europe, which are brought hither chiefly by the English, Dutch, French, Venetians, and Genoese, by the Mediterranean, and hence conveyed to Persia, and other countries. And here also are found the best merchandizes from those parts, as raw silk, cotton, grograms, yarn, galls, and a great variety of drugs.

The English merchants have a consul at Aleppo as well as at Smyrna, and are civilly treated by the Turks, English cloths being in great esteem amongst them. The French, Dutch, Italians, Arabs, Persians, and Indians, have also their consuls, and all of them have free access to the government to complain of any injuries or grievances, which seldom fail of being redressed, especially if the application is attended with some considerable present; for the place of a Turkish governor or commandant is his harvest, and he never fails making the best use of the sun-shine.

The city is about three miles in circumference, has twelve gates, and three large suburbs, and is divided into forty-five wards. The suburbs are large and well built, and chiefly inhabited by christians of different denominations. The whole amount of the inhabitants, Jews, Turks, and Christians, in the city and suburbs, is computed at about 250,000 souls.

The kans or inns, the bazars, divans, and other public edifices of Aleppo, are in like manner very fair and elegant, and generally make a much better figure within than on the outside, being not only very richly furnished, but adorned with variety of marble work of different fashions and colours, with fret-work ceilings, golden inscriptions, and many other embellishments. The streets are well paved, except the bazars, where the merchants and mechanics have their shops, which indeed are narrow, and have only a foot causeway on each side, with a horse-road in the middle.

The rest of the houses are in general better built than they commonly are in most parts of Asiatic Turkey, being chiefly of white stone, one story high, with terraces and small domes on the top. The inhabitants are industrious, and carry on several considerable manufactures, particularly one of fine Turkey leather, which they suffer no stranger to see them prepare. Gall-nuts, especially that shell of them which they call *valanede*, is one of the principal ingredients in their leather dressing. Their manufactures of silk, choice camblets, and soap, are also very considerable.

Though the country in the environs of Aleppo is mountainous and rocky, yet it produces great plenty of corn of all sorts, particularly in the chalky vallies; but little grass or oats are met with, the ground being too dry, and for the better part sandy. The harvest begins about the end of April, or beginning of May. The lower grounds are covered with olive and other fruit

trees, culinary plants and pulse, and in short with the finest variety of every thing desirable in these respects, either for exquisite taste or beauty.

Two things (among others) are very remarkable in regard of trade: the one is the custom of making pigeons serve for messengers, to give advice of the ship's arrival, and other pressing affairs, which is done by taking them from their young ones at Aleppo, and sending them to Alexandretta, a little before it is supposed they may be wanted, which being let fly at this place, with a billet about their necks, return in three hours: the other thing remarkable is the prohibition to go from Alexandretta to Aleppo, any other way than on horseback; and the reason of it was to prevent sailors running a foot to Aleppo, and there spoiling the price of goods by their over-urgency in laying out their stock, which without this ordinance would be greatly diminished.

There is hardly any place in the three ancient parts of the world, from whence some merchants are not seen at Aleppo: besides the English, French, Dutch, and Italians, which reside there, the caravan-seras are always full of Armenians, Turks, Arabians, Persians, and Indians, which come in such numbers by the caravans, that although there are above forty of those public buildings, they hardly suffice to contain those, who only appear to transact some transient business, and who after selling their goods, return by the way they came, with their new purchases.

The merchandizes proper for this place, are the same as those for Smyrna, which see, and those which the ships reload, are silks of the country, and Persian cotton cloths of various sorts, and among others blue amians, auquilles, lizardes, those from Beby, others called linen antiquies, ajamis, and abundance of chintz, different cottons, and cotton threads, galls, cordovans, soap; many species of silk stuffs, and those admirable camblets before-mentioned.

ALEXANDRETTA, now called *Scanderoon*, the port of Aleppo, is situate on the gulph of Ajazzo, near the sea-coast, in latitude 36. 34. east longitude 36. 40. It stands on such a marshy and unhealthy ground, that at present it is but a confused heap of wretched wooden houses, inhabited mostly by Greeks, who entertain all the seamen and ordinary travellers that come hither: as for merchants and persons of higher rank, they are generally lodged by the consuls of their nations, who have built themselves handsome houses about a mile or two from the town, which are now encreased so as to appear like a little city. During the hot months, few, who have the misfortune to come here, escape being seized with some acute disease, if they do with their lives. The very inhabitants are forced to retire to the village of Beylan, situate on a high hill, about four leagues off, and abounding with fresh water, and excellent fruits. This hill has an opening which yields a free passage to the north-east wind, and when it blows hard, all the vessels in the harbour commonly weigh anchor, and make to the open sea, to prevent being dashed in pieces.

This port has a governor and some few soldiers, and is defended by an old castle, but of small use were it to be attacked by any force; inasmuch, that it is a matter of wonder that the pirates, who swarm on this coast, never attempt it. Pigeons, as mentioned in the article of Aleppo, taught to fly with letters about their necks, keep up an expeditious correspondence between Aleppo and this place; so that the rise and fall of merchandizes are soon known in both. The country round Alexandretta is flat and very fertile, and beyond it is a spacious plain, called the plain of Antioch, watered with a number of little rivers, brooks, and canals, and abounding with most necessities of life, particularly with cattle, which are turned in there to fatten.

ALEXANDRIA, E. lon. 31. 15. lat. 30. 40. a great city and port town of the Lower Egypt, in Africa, situate 14 miles west of the most westerly branch of the river Nile, and 120 miles N. W. of the city of Grand Cairo. The old town was about seven miles in circumference; built by Alexander the Great, and still called *Scandria* by the Turks; but, except one long street which faces the harbour, it is only a heap of ruins at this day; there is little left standing but part of the walls,

walls, which have great square towers, at 200 paces distance, and a little tower between them; every one of the great towers could contain 200 soldiers, and had a cistern in it, to which the water of the Nile was conveyed; and the cisterns still serve to retain the rain water, and what is brought to them from the Nile; for Alexandria stands in a barren, desert country, where there are neither springs nor rivers, though it was once the capital of Egypt.

Alexander lived too short a time to be a witness of the happy and flourishing state, to which commerce would elevate this city. The Ptolemies, who after his death had Egypt for their part of his conquests, took care to support the infant trade of Alexandria, and soon brought it to such a degree of perfection and extent, as to bury in oblivion both Tyre and Carthage, which, during so long a time, had carried it on, almost alone, and had reassembled to them the commerce of all other nations.

This sudden success of the commerce of Alexandria, ought not to occasion much surprize, when reflection is made on its happy situation, which rendered it so commodious to be the depository of all merchandizes from the east and west.

This famous city had on one side a free commerce with Asia, and all the east, by the Red Sea; the same sea and the Nile gave her entrance into the vast and rich countries of Ethiopia. The commerce of the rest of Afric and Europe was open to her by the Mediterranean; and, if she would carry on the interior commerce of Egypt, she had besides the conveniency of the Nile, and canals made by the hands of men, works immortal, and almost incredible, of the first Egyptians! She had also the help of caravans, so convenient for the safety of merchants, and for the transportation of their merchandizes.

There was added a large and safe port, where foreign vessels arrived from all parts, and whence departed incessantly the Egyptian vessels, which carried their merchants and commerce to all parts of the known world.

It was this conveniency of depositing merchandizes at Alexandria, that spread through all Egypt those immense riches, which rendered their kings sufficiently powerful to support themselves, for more than an age, against the Romans, who endeavoured, from time to time, to subdue so fine a kingdom; riches so considerable, that historians affirm, that the product only of the customs of importation and exportation, upon the merchandizes that passed the Custom-houses of Alexandria, amounted annually to more than thirty millions of livres, or about 2,225,000 l. sterling, though the major part of the Ptolemies were moderate enough in the imposts which they laid on their people.

Before the battle of Actium, the Romans had always found, in the spoils of the nations they had subjected, wherewithal to fill the treasury of the republic; and, at the same time, to furnish a sufficiency for the expences, in which the plan of an universal monarchy continually engaged them.

These resources beginning to fail them, the commerce of Egypt seemed very proper to support by its riches (and as I may say, by its credit) the reputation and empire of Rome.

From the time that Augustus had reduced this kingdom to a province, he earnestly endeavoured to make the trade of Alexandria flourish more than ever, and at the same time he augmented that which the Egyptians had always maintained, or carried on in Arabia, the Indies, and to the most remote parts of the earth, by way of the Red Sea.

Alexandria become Roman, was only inferior to Rome itself, in grandeur, and in number of inhabitants. The magazines of the capital of the world were no longer filled but with the merchandizes which came to it from the capital of Egypt; and very soon neither Rome, nor all Italy subsisted, but by the corn and other provisions brought to it by the merchants and Egyptian fleets; and that in so great a quantity and abundance, that an historian (Josephus) affirms, though doubtless with some exaggeration, that Alexandria yielded more riches to the treasury of Rome in one month, than all Egypt in a year. Though if Pliny's calculation is to be credited,

the profits of the commerce of Egypt amounted yearly, for Rome, to 125,000,000 of crowns French money; and these estimated at 54 d. to about 28,125,000 l. sterling; that is to say, a hundred times more than the Romans employed, whose ordinary expences did not amount to above 1,125,000 crowns.

This great trade (which soon made that of all the other provinces of the empire flourish) augmented constantly, and made the senate determine to maintain it, by the corporation it established in Rome, for *trade* and *traders*, by the laws which it made in their favour (or rather by those of the Rhodians, which it adopted, and which are long since become a species of the law of nations, for the navigation and commerce of the Mediterranean) by the magistracy it encharged with their execution, and by the protection which it afforded to the merchants, as well strangers as Romans, in all the extent of the empire.

Alexandria, notwithstanding, had in the end the fortune of Tyre and of Carthage. Trade had raised her, and the fall of her trade overset her. The Saracens, who seized on Egypt in the reign of Heraclius, having by their fierceness driven away the merchants, who love tranquility and peace, this city, which then held the first rank after Rome and Constantinople, hardly preserved any thing of its ancient splendor; and though it afterwards regained some vigour under the sultans, and the same now from the christian nations, which carry on the Levant trade, and maintain a tolerable good business; it is, however, no longer possible to know again that ancient Alexandria, so famous, which by its trade was, for so long a time, the glory and support of an empire; and which, in truth, though founded by arms, received its principal strength from commerce. See EGYPT and CAIRO.

ALEXIPHARMICS, properly signify remedies to expel or prevent the ill effects of poisons taken internally. But as some of the moderns have imagined that the animal spirits in acute distempers, were affected by a kind of malignant poison, *alexipharmics* have been understood to mean remedies adapted to expel this poison by the cutaneous pores in the form of sweat. And in this sense *alexipharmics* signify the same as *sudorifics*. The most efficacious medicines of this kind owe the virtue of their operation as well to the power they possess of increasing the systaltic motion of the heart, and the elasticity of the arteries, as to the number and force of their vibrations, by which means, a greater velocity being added to the circulation, they protrude the perspirable matter through the outward and porous substance of the skin. This they perform either by a subtile, acrid hot oil, or by a volatile empyreumatic salt, of an igneous nature; or by an acrid, resinous salt, more or less fixed; or lastly, they act, and that very powerfully, by means of a very fine mineral salt and sulphur, by which they rouse the nervous fibres to a violent motion.

The very active sudorifics, or alexipharmics, rarely find a place in medicine, and are not to be administered but with singular caution. For a sweat never rises in a healthful and natural state, unless the blood is put into an extraordinary motion; nor when this happens is it a sign of health, like insensible perspiration, the matter of which is void of acrimony, watery, resembling the nutritious juices, and almost destitute of taste or smell, differing very much from sweat, which is of a salt taste, a fetid smell, and approaching the nature of urine. Besides, sudorifics excite a great commotion, and orgasm; for they act not with moderation, but rapidity; whence it comes to pass, that in bodies replete with blood, or contaminated serum, by impelling the fluids with too much violence to the small and narrow vessels, they bring on dangerous and acute symptoms, occasioned by the inflammation and redundancy of humours. But they are particularly hurtful where the *prima viæ* are obstructed by a load of vicious humours, where the body is costive, and when they are administered immediately after a violent fit of anger. Hoffman.

ALEXITERIALS, properly signify helps or remedies, and in this sense the word is used both by Hippocrates and Galen; but later writers have applied it

to external remedies against the bites of venomous animals, and even to amulets and charms directed to be wore with a view of preventing the ill consequences of poisons, &c.

ALFANDIGA, the name of the Custom-house at Lisbon, the capital of Portugal. Here are paid the duties of import and export as is practised at the Custom-houses of other countries. All gold or silver lace, fringe, ribbons, are there seized, as contraband goods; no person whatsoever in Portugal being suffered to have gold or silver worn or spun upon his cloaths or furniture.

ALGA, *Sea-wrack*, in botany, the name of a sea-plant, which grows in great quantities along the shore of the Mediterranean-sea, and other places. Its leaves are about a foot and a half long, smooth, soft, and easy to break; sometimes white, sometimes red, or of an obscure green.

It contains a great deal of fixed salt, for which reason they use it in making glass instead of kali.

ALGARVE, a little kingdom within that of Portugal. It is wedged in by the ocean on the west and south; on the east by the Guadiana, which parts it from Andalusia; on the north by mountains called Serra de Algarve, or Colderao, and Serra de Monchique, which divide it from Alentejo; so that it is but 98 miles in length, where longest; and but 28 in breadth, where broadest.

The country though very mountainous in most parts of it, is yet very fertile. It doth not indeed produce any great quantity of corn, but abundance of wine, oil, figs, raisins, dates, almonds, pomegranates, and other fruits, though not so exquisitely tasted as those of Spain; and, as the palm-trees are here in great abundance, the poor people employ themselves in working the leaves of them into a variety of knacks; but, in the main, the country is nothing populous or wealthy, nor their cities and towns very remarkable for any tolerable share of trade.

Lagos, one of the cities of Algarve, is about 110 miles south from Lisbon, and 25 east from cape St. Vincent. It is seated on a large bay, that opens southward to the ocean, and where fleets have anchored during the war with Spain in queen Ann's time. Figs are one of the chief commodities of the kingdom of Algarve, and are shipped off at Faro and Figuera in this bay, or near it. This country is exceeding fruitful, and the figs in particular are not only the best, and the best cured for merchandize of any we find, either in Spain, or on the coast of Barbary, but there is the greatest quantity: for the English, Dutch, Flemings, and Hamburgers, fetch them in great quantities; and it is said, that there are frequently forty or fifty ships a year, which are laden with figs in this little country.

ALGEROTH, a preparation of antimony and sublimate, so called from Algerothos, a physician of Verona. It is now generally called *mercurius vitæ*, mercury of life.

ALGIER, a kingdom of Africa, is bounded on the east by Tunis, on the west by the kingdom of Fez, on the north by the Mediterranean, and on the south by the deserts of Biledulgerid. It enjoys a constant verdure; for in February the leaves begin to bud, and in April they shew their fruit in full growth, which are mostly ripe by May. The grapes are fit to gather in June; and the figs, peaches, nectarines, olives, nuts, &c. in August. The soil is various, many parts being dry, hot, and barren; others fertile in corn and fruit; and others in excellent pasture grounds. The towns, even along the sea-coasts, are but few and thinly peopled, except the metropolis. The Algerines are very great pyrates, and reckoned the most dangerous of all Africa. They are extremely avaricious and cruel to those that fall into their hands, especially to the christians. In the city of Algier, the capital of the whole kingdom, are merchants of several nations, and so numerous, that they amount at least to 3000 foreign families, which have settled there on account of trade, and keep above 2000 shops in the two bazars of the place. The Jews, whose number amounts to 8000, dwell together in a particular quarter, and almost the whole trade here passes through their

hands. The greatest commerce of the Algerines consists in the merchandize which they obtain by the pyratel plunder of the christians over the whole Mediterranean, and in part of the ocean. The Corsairs are continually bringing in prizes, with great numbers of christian slaves. Their marine is so strong, that they fit out every year to the amount of twenty-three vessels, with three or 400 men each.

ALGIER PROPER, is bounded on the east by Bugia, on the west by Tenez, by the Atlas on the south, and by the Mediterranean from the mouth of the Chinelof to the northern confines of Bugia. The territory of Algier is fertile in fruits, and the plain of Moligia produces corn, barley, and oats, two or three times a year, besides other grain. The melons are of an exquisite taste, some of which ripen in summer, and others in winter. Their vines are very large and thick, and the bunches of grapes commonly a foot and a half long.

Every Turkish vessel, of what nature or bigness it be, pays 20 piafters for anchoring in the harbour of Algier, the capital.

The christian ships, large or small, pay each 40 piafters, when their princes are at peace with the republic. They whose sovereignty is at war with Algier, may go thither on paying 80 piafters: they having nothing to fear, as soon as they are in the harbour; but at sea, either going thither, or coming from thence, they are liable to be taken, as usual.

The produce of this duty for anchoring, is divided between the dey, the grand writers, the aga-bachi, who is upon duty for searching or visiting the marine, the interpreter or linguist of the factory, under the protection of whom the vessel is, and the Spanish hospital; every one has a share as settled by the regulation. It is the interpreter's business to make the distribution, and give every one his proportion.

The duty of importation on all merchandize, belonging to Turks, Moors, or Jews, is $12\frac{1}{2}$ per cent. and of exportation $2\frac{1}{2}$.

The English, since the taking of Oran, have obtained a diminution of the duty of importation, and pay but five per cent. The French obtained the same favour, by an article inserted in the ratification of the treaty of peace, concluded the 27th of January, 1718, by the commodore count du Quesne.

Money pays always five per cent. for importation, except that which is designed for the redemption of slaves, which pays but three per cent.

All brandies, or spirituous liquors and wines pay, without any distinction, four current piafters per cask for importation.

The company of the Bastion de France is allowed the cargo of two barques every year, without paying any duty. See BASTION of France.

The coin, or species current of Algier, and struck there, are the gold sultanis and the aspers; and a small coin called burbas, six of which make an asper, and the doubas, a silver coin, worth a little above three livres French money.

Foreign species current at Algier, are Venetian sequins, sultanis of Morocco, gold coin of Portugal, Spanish pistoles, and piafters.

The currency of the coin is not fixed, but varies according as the government requires it, yet the difference is but small. Foreigners reckon the value of those species, according to the price of bullion in Europe.

There is nothing fixed or settled, but the *patack chique*, or patack of aspers, which is an imaginary money, always worth 232 aspers. The third part of a current piafter, which is commonly called *patack gourde*, weighs about two piafters and a half; but its weight is sometimes increased or decreased, arbitrarily, as the dey pleases.

There are money-changers at every corner of the streets, who are Moors. They change other species of coin for aspers, without any profit but the base or counterfeit aspers, which they know how to slide amongst the good ones; and people do not take much notice of this, nor is it an easy matter for others to distinguish the good from the bad aspers.

When a person receives a sum of money, he sends for one of these money-changers to examine the species, in which they are very expert, by their daily practice and occupation.

The merchandize for importation consists in gold and silver stuffs, or tisfues, damasks, drapery goods, spices, tin, iron, copper, lead, quicksilver, small cordage, bullets, common linens, sail-cloth, cochineal, tartar, alum, rice, sugar, soap, gall-nuts of Aleppo and Smyrna, cotton in the wool and spun, copperas, aloes, Brazil wood, Campeachy, or logwood, cummin, vermillion, arsenic, gum-lack, anise of Malta, sulphur, opium, mastic, farsaparilla, oil of lavender, common frankincense, gall-nuts, honey, wool, paper, combs, cutlers ware by sets, old and new cards for cardings, and dry fruit.

There is but a very small quantity of those merchandizes sold at Algier, though the country always wants them, because there are duties to be paid; and it is difficult to get one's money after the sales, the returns being uncertain, and insults and oppressions very frequent.

They who have any occasion for any of these commodities, wait 'till the last extremity; being always in hope that some prize will soon arrive, laden with what they want, which happens very often.

There is less hazard in carrying piafters thither, because you may run them without much difficulty, and strike very good bargains with the dey, when there is a plenty of prizes.

Merchandize for exportation consists of ostrich feathers, wax, leather, copper, rough wool, woollen coverlids, embroidered handkerchiefs, silk girdles after the Turkish fashion, dates, and christian slaves.

We meet sometimes with all sorts of commodities, brought in with the prizes.

The vessels whose flag is free, that is to say, whose states are at peace with those of Barbary, meet sometimes at Algier with a cargo for Tetuan, Tunis, Tripoli in Barbary, Alexandria, Smyrna, or Constantinople.

The trade, carried on for some years past at Algier, is but trifling. The French have had little; the company of the Bastion of France, who had the liberty to send two cargoes thither every year, having sent none these several years, because they could not procure payment of the last merchandize they had imported thither.

The Jews of Leghorn engrossed, for some years, the small remains of trade at Algier, by means of one of their nation called Solomon, and surnamed *Jacquet*, who lived a great while at Algier, where he died in the beginning of the year 1724. He was a very artful intriguing man, who, by many unfair practices, had gained the confidence of the reigning powers, under a pretence of being very zealous for the dey's interest. He fitted out ships for cruising, and was farmer of the wax; for it must be observed, that the Turks, and even the Moors in the cities, look upon that employment as a disgrace, and upon all the farmers of duties or taxes, as publicans, or usurers. He used to give notice of all that passed in Christendom, and had managed so well by his correspondence, that the christian slaves could hardly be redeemed by any other person but himself. This was to obtain advantageous commissions, and secure to himself all the profit there was to be made, on the difference between the piafters of Algiers, and those that are current in Europe.

When he knew there was a bargain on foot for the redemption of slaves, he used to outbid the others, till they were tired, and forced to apply to him. He was favoured therein, as in all other things, by the state, and was looked upon as one of the chief supports of the country.

The English consul, who is the only merchant of that nation at Algier, has the most profitable trade: he sells to the republic powder, shot, bullets, grenades, hatchets, anchors, cordage, and other warlike stores, when he wants them; and the dey gives him, in return, oil, corn, and other provisions, the exportation of which is prohibited to all others.

There is a French consul, under whose protection the foreign Jews, the Greeks, the Armenians, and others, put themselves, and apply to him in their several disputes. This consul is forbidden to carry on any trade, either directly or indirectly.

There was formerly a factory and consul for the United Provinces; but he retired in the year 1716. The Algerine corsairs taking at that time hardly any prize, the militia caused the divan to meet, and there represented, that they no longer met at sea with any ships of the enemy, all those they happened to see being either English, French, or Dutch; and that, the country not being able to subsist without prizes, it was necessary to declare war with one of these three nations by a majority of votes.

Accordingly it was declared against Holland; whereupon they immediately stopped a vessel of that nation, which was in the harbour, and the dey sent orders to do the same in all the ports of the kingdom. He allowed the Dutch consul as much time as he pleased, to settle his affairs; and affected to pity and solace him. This consul was a great friend of the dey, and had a very fair reputation amongst the Christians, the Turks, and the Moors.

The principal provinces of trade in this kingdom are,

1. *Bona* province, bounded upon the north by the Mediterranean, on the east by Tunis, on the south by Constantina, and on the west by Labez. This country is fertile in corn and fruit, particularly in the jubub-tree, which covers a great part of it. They breed likewise quantities of cattle, large and small, but are so exposed to the continual incursions and rapines of the Arabs, that only a small part of the mountains is inhabited. Six miles east of the town of Bona is a fort, called the Bastion of France, and is kept by the French, who have their magazines of corn and other commodities, and apartments for those who are concerned in them. The road for ships is very bad before the town of Bona; but a little further westward, where the Genoeese fort stands, it is deep and safe. On the east side of the bay of Bona, the Genoeese have a coral fishery.

2. *Constantina* province, borders on the east to part of Tunis and of Bona, having the kingdom of Labez on the west, on the south the Atlas, and the Mediterranean and part of Bona on the north. It hath a fruitful soil, the low lands abounding in corn, fruit, &c. and the mountains with pasture grounds.

3. *Gigeri*, or *Fijel* province, reaches to the frontiers of Numidia, and upon the sea-coasts, having Bona on the east, Conquo, and Algiers on the west, and Labez on the south. It is mostly dry, mountainous, and barren, producing nothing but some little barley, flax, hemp, and a few nuts. The inhabitants of this province are so like a great many of our coasters in Cornwall, Suffolk, &c. that they spare no wrecks at sea, let them be friends or foes; only, if the crew be Mahometans, they give them some small viaticum, to bring them on in their way home; and even if the ships belong to the Turks, or to the allies and friends of the dey of Algier, he can save nothing of it to the owners by any other means than a friendly composition: whereas, on any other coasts but those of *Gigeri*, both the dey, his agas and officers, will interpose their authority in favour of their friends, though it often happens even there, that their assistance comes too late to be of any service to the sufferers. The inhabitants of the town of *Gigeri* live chiefly on these wrecks.

4. *Bugia* province, by the Africans called *Buggaya*, or *Buggia*, lies also on the Mediterranean, east of Algier, and has the mountains of Labez on the south, the *Gigeri* and part of Constantina on the east. The soil is poor and dry, and bears but little wheat, but a good deal of excellent fruit and good pasture. The wealth of the inhabitants consists in fruit, cattle, and hempen and flaxen cloth. The money they use is made of pieces of iron, weighing about half a pound, and small pieces of silver of about four grains.

5. *Labez*, a kingdom, lies on the south of Bugia, having Tunis on the east, Conquo on the west, and Mezezeb on the south. It is very mountainous and barren,

barren, having but little corn or fruit growing in it; and in most parts scarce any thing but a kind of sword-grass, with which they make their mats, called by the Arabs, *Labez*, from which the country hath got the name. It is stiled a kingdom, because, having been formerly such, it still retains its ancient title, though only a tributary province of Algier.

6. *Conco*, or *Conquo*, adjoins on the west to that of *Labez*, and is inhabited mostly by the Bereberes and Azuages, who are so fond of liberty, and afraid of being reduced to hard slavery, like most of their neighbours, that they chuse to lead a poor indigent life on their almost inaccessible mountains, rather than pay some small tribute to the government of Algier; and, in all other cases, avoid all traffic or commerce with them. The country produces plenty of fruit, hemp, flax, honey, wax, cattle, and corn enough for their use. The higher mountains have also mines of salt-petre, and iron, and the king's revenue is computed at 700,000 ducats.

7. The province of *Beni-Araxid*, or *Beni-Razid*, is one of the dependencies on Algier; the south of which is a plain champaign country, and the north very mountainous, but interlaced with fertile vallies, abounding with corn, honey, and pasture-grounds; and the whole province producing plenty of jububs, figs, and other excellent fruits. One part of its inhabitants dwell in towns and villages upon the mountains, and cultivate their corn-fields, vineyards, and fruits. The other, which inhabit the plains, range about from place to place like the Arabs, and are richer in cattle, camels, horses, &c. The chief towns are,

Beni-Arax, which hath a great number of persons of quality and wealth.

Calaa hath a good number of merchants and artificers, who live very comfortably.

El-Mohajcar, hath a market every Thursday, to which the Bereberes, Aruages, and Arabs, repair to sell their cattle, corn, barley, dried-figs, and raisins, honey, wax, oil, &c. and the merchants of Tremecen their cloths, linen, camlets, bridles, saddles, and other such commodities.

The territory about *Batha* is covered with the finest fruit-trees, and is very well cultivated.

8. *Miliana*, or *Magnana* province, is situate on the south and east of *Algier Proper*, and joined on the west to *Beni-Araxid*; it is inhabited mostly by a rude people, whose chief business is weaving of linen cloths, and making of saddles, after the Morocco fashion.

9. *Tenez* province, hath *Algier Proper* on the east; Tremecen on the west, of which kingdom it was formerly a part; the Mediterranean from the mouth of the river Chiles, or Cartena, to that of Aslafran on the north; and on the south it reaches quite to mount Atlas. The soil is generally very fruitful, producing plenty of corn, cattle, wax, honey, and variety of fine fruit; but the natives are uncivilized and morose, though they drive a great commerce with strangers; whereas, the Arabs, though very ignorant, are of a contrary disposition. They are stout and brave, and very impatient under the Turkish yoke. There is over-against the city of *Tenez* a small island, under which the vessels that trade to it shelter themselves in tempestuous weather. The inhabitants have, in conjunction with the brave Arabs above-mentioned, made some noble efforts to shake off the Turkish yoke, but hitherto in vain.

10. *Oran* province, on the Mediterranean coast, has *Harifgal* on the west, *Tenez* on the east, and is bounded on the south by Tremecen: it is as fruitful as most of the provinces.

The town of *Oran* stands about a musket-shot from the sea, and is well fortified.

11. *Tremecen* province, reaches, in length from east to west, from the confines of *Anga* to those of *Fez*, and from north to south, from the sea to the desert of *Atlas*. The country is very well watered, and produces plenty of corn and variety of fruits and cattle, especially on the north side: the rest towards the south is more dry, barren, and sandy, and even the parts adjacent to the capital are mostly desert, which is the reason why there are so few towns in this province. But those that are in it, are generally well seated, built, and inhabited, and the

people in good circumstances. Those who live in the more desert parts of this province own no subjection to the deys of Algier, but ramble where they please, and will trade with the Christians in a friendly manner. The merchants of this province trade chiefly into the country of the Blacks, where they exchange their merchandize for tibar, gold, ambergrease, musk, civet, African bezoar, elephants-teeth, negro slaves, &c. and this traffic is so advantageous to them, that two or three such journeys are sufficient to enrich a man; and so it hath need, considering the length and difficulty of it through such vast sandy deserts, and the danger they run from the sands, heat, and drought, and especially from the plundering Arabs. The inhabitants of the towns here are well-bred and courteous. The chief town is,

Tremecen, situate about thirty-five miles from the Mediterranean, which grew to a considerable height of splendor and opulence under its kings, but is much decayed, since it hath been under the Turkish yoke. Within its circuit are still made great quantities of oil, and excellent grapes dried, and sent abroad. In the city are variety of manufactures, especially those of woven cotton, silk, and linen carpets, &c. in the neatness of which they excel to a great degree, insomuch that some of their mantles will scarcely weigh ten ounces. They are likewise famed for their fine saddles, stirrups, bridles, &c. which are made after the Moreisco fashion. See AFRICAN COASTS.

ALGORITHM, the four principal rules of arithmetic, viz. addition, subtraction, multiplication, and division.

ALICANT, W. long. 30 min. lat. 38. 35. a large sea-port town in the province of Valencia in Spain, the castle on a high rock, and almost impregnable. It is situate 60 min. south of Valencia, and about as many north of Carthage, and has a great foreign trade in wine and fruit. The castle was taken by the English in the year 1706, and held out a siege of two years almost, against the French and Spaniards; and surrendered, at last, upon honourable terms, after part of the rock, on which the castle stood, was blown up, and the governor killed.

ALICONDE, an Ethiopian tree, from which a flax is prepared, and linen made.

ALIEN is one born in a strange country, out of the allegiance of the king, being quite contrary to *denizen* or natural subject; though a man born out of the land, provided the place of his nativity be in any of his majesty's dominions beyond-sea, or born of English parents, out of the obedience of the king, if the parents at the time of his birth were of such obedience, is no *alien*. 25 *Edw. III. cap. 2.*

And if one born out of the king's obedience, come and reside in England, his children begotten and born here, are not *aliens*, but *denizens*. 7 *Rep.*

All persons being the king's natural born subjects, may inherit, as heirs, though their ancestors were *aliens*. 11 and 12 *Will. III. cap. 6.*

If an ambassador have any children in a foreign country, by a wife, who is an English woman, they are by the common law natural born subjects, and not *aliens*.

And if an English merchant residing beyond-sea, marries a woman of the country, by whom he has a child, and then dies, this child is born a *denizen*, and shall be heir to him, notwithstanding the wife be an *alien*. *Cro. Car. 605. March 91.*

Those which are born in the English plantations, are subjects born, as are those likewise born on the king of England's seas. *Danv. Abr. 324.*

There are two incidents that are regularly necessary to make one a subject born: first, that his parents at the time of his birth, be under the actual obedience of the king; or, secondly, that the place of his birth be within the king's dominions. 7 *Rep. 18.*

It is the place of birth that makes the disability of an *alien*, to have lands, &c. the blood is not the disability, but the place where born. *Cro. Jac. 539.*

An *alien* can hold no land by descent or purchase, or be tenant by the courtesy, or in dower. 5 *Rep. 502.*

An *alien* may purchase a house for years, for an habitation during his residency, necessary for his trade, (though not lands) and if he, being a merchant, leaves the realm, the king shall have the lease; and if he dies here possessed thereof, his executors, or administrators, shall not have it, but

but the king, he having it only as a habitation for his trade; and if an *alien* be no merchant, the king shall have his lease for years, though it were for his habitation. 7 *Rep.* 18. 1 *Inst.* 2. 129. 2 *Inst.* 741.

The law is the same if he takes a lease of meadows, lands, woods, or pastures; the king shall have the same, for the law provides him nothing but an habitation, to trade and traffic in as a merchant. *Pafch.* 29 *Eliz.* Sir *James Croft's Case* by the Judges.

An *alien* can have no real, or personal action for, or concerning lands, tenements, or hereditaments, to him and his heirs; albeit, he can have no heir, yet he is of capacity to take a fee-simple, but not to hold; for the king upon office found shall have it by his prerogative. 1 *Inst.* 2.

A devise of lands to an *alien* is void. 4 *Leon.* 82.

And if a man be bound to an *alien* enemy, in an obligation, the bond is void to him, but the king will have it. 1 *Lev.* 59. *Danv. Abr.* 322.

Aliens may obtain goods, and personal estate, by trade, &c. and may maintain actions for the same; they may also have action of assault and battery, and for support of their credit. 1 *Bull.* 134.

But they cannot bring any real action, unless it be for a house, for a necessary habitation, being for the benefit of trade. 7 *Rep.*

And an *alien* enemy cannot maintain any action whatsoever, nor get any thing lawfully within this realm. *Terms de Loy.* 36.

Aliens living under the protection of the king, may have the benefit of a general pardon. *Hob.* 271.

No *alien* shall be returned on any jury, nor be sworn for trial of issues between subject and subject, &c. but where an *alien* is party in a cause depending, the inquest of jurors are to be half denizens and half *aliens*; but in cases of high-treason, this is not allowed. 2 *Inst.* 17.

An *alien* shall not have any vote in the choice of knights of the shire, or burgesses to parliament. *Hob.* 270.

And all *aliens* are incapable of being members of parliament, enjoying offices, &c. 19 *Will.* III. cap. 2.

If an action is brought against an *alien*, and there is a verdict and judgment against him, yet he may bring a writ of error, and be plaintiff there, and that such plea is not good in that case. 1 *Brownl.* 42.

Though an *alien* may purchase and take that which he cannot keep or retain, yet the law hath provided a mean of inquiry before he can be divested of the same, for until some office be found, the freehold is in him. *Goldsbour.* fol. 29 *Mich.* 30 *Eliz.* *Coke* 5 part. *Page's case*, fol. 52.

And this office, which is to gain the king a fee, or freehold, must be under the great-seal of England, for a commission under the exchequer-seal is not sufficient to entitle the king to the lands of an *alien* born, for the commission is what gives the king a title, for before that he hath none. *Moore* 4. *Walton* ver. *Masbum*.

An *alien* cannot purchase lands for his own benefit, but he may for that of the crown; therefore if land be devised to an *alien*, the crown shall have it; yet if an *alien*, tenant in tail, suffers a common recovery before office found, the recovery is good. *Dyer* 282. *Lucas's Rep.* 91, 94, 120, 122, 124, 136.

If an *alien*, and a subject born, purchase lands to them and their heirs, they are joint-tenants, and shall join in a seizure, and the survivor shall hold place till office found. 3 *Cro.* 123. *Plowd. Com.* 477.

By the finding of this office, the party is out of possession, if the same be of houses or lands, or such things as do lie in livery; but of rents, common, advowsons, and other inheritances incorporeal, which lie in grant, the *alien* is not out of possession, (be they appendant or in gross) therefore if an information or an action be brought for the same, the party may traverse the office, in that court where the action or information is brought for the king.

And if the king obtains not the possession within the year after the office found, he cannot seize without a *seire facias*. 29 *Affize*, 30, 31, 32. *Affize Travers.* 32.

An *alien* infant, under the age of twenty-one years, cannot be a merchant-trader within this realm, nor can he enter any goods in his own name at the custom-house. 13 and 14 *Car.* II. cap. 11. *scil.* 10.

If an Englishman shall go beyond-sea, and shall there swear allegiance to any foreign prince or state, he shall be

deemed an *alien*, and shall pay the same imposition as they; but if he returns and lives in England, he shall be restored to his liberties. 14 and 15 *Hen.* VIII. cap. 4.

An *alien* enemy commorant here by the king's licence, and under his protection, may maintain debt upon bond, although he came not with safe-conduct. *Lord Raym.* 282.

The eldest son of an *alien* (being also an *alien*) cannot inherit, but the land shall descend to the younger brother, if a denizen; as for instance, if there be three brothers, of which the eldest is an *alien*, the other two naturalized, and the middle brother purchases and dies without issue, the younger brother shall have the land. *Cro. Jac.* 539. *Dr. and St. Di.* 1. cap. 7.

Concerning the rule of descent, a proximity of blood is not so much to be regarded as the municipal laws of the country in which the question ariseth, for the several laws of divers kingdoms have variously disposed the manner of descents, even in the same line and degree of nearness; for instance, the father certainly is as near akin to the son, as the son is to the father, and is nearer in proximity than a brother, and therefore shall be preferred as next of kin in administration to the son's estate.

According to the laws of England, the son's dying without issue, or brothers or sisters, the father cannot succeed, but it descends to the uncle. *Lit. f.* 3.

There are two kinds of descent, according to the common law of this realm, 1 *Inst.* 10. viz.

1st. *Lineal*, from the father, or grandfather, to the son, or grandson; and 2dly. *Collateral*, or transversed; as from brother to sister, uncle to nephew, and *e converso*: and both these again are of two sorts:

1st. *Immediate*, as in lineals, from father to son;

2dly. *Mediate*, as in lineals, from grandfather to grandchild; where the father dying in the life-time of the grandfather, is the *medium differens* of the descent collateral; as in lineal, from uncle to nephew, or *e converso*. *Haley's History of the Law.* cap. 1. *Grat. de Jure Belli ac Pac.* lib. II. cap. 7.

And this mediate descent, or mediate ancestor, though to many purposes it may be immediate; for the father dying in the life-time of the grandfather, the son succeeds in point of descent in the lands immediately to the grandfather; and in a writ of entry shall be supposed to be in the grandfather, and not in the *post & cui*.

This is called a mediate descent, because the father is the *medium* through whom the son derives his title to the grandfather.

In *immediate* descents there can be no impediment but what arises in the parties themselves; for instance, the father seized of lands, the impediment that hinders the descent, must be in the father or son, as if either of them be an *alien*.

In *mediate* descents the disability of being an *alien*, in him that is called the *medius antecessor*, will disable a person to take by descent, though he himself have no such disability.

In *lineal* descents, if the father be an *alien*, and hath issue a denizen born, and die in the life-time of the grandfather; the grandfather dies seized, the son shall not take, but the land shall *escheat*.

In *collateral* descents, A and B brothers: A is an *alien*, and has issue C, a denizen born; B, purchases lands, and dies without issue; C shall inherit, because A, which was the *medius antecessor*, or *medium differens*, is incapable. *Dyer* 274. *Gray's Case*.

But in any descents, the impediment in an ancestor, who is not *medius antecessor*, from whom, and to whom, will not impede the descent.

As for instance; the grandfather and grandmother being both *aliens*, have issue, the father, a denizen, who hath issue the son, a natural born subject; the father purchases lands, and dies, the son shall be heir to the father, notwithstanding the disability of the grandfather (and yet all the blood that the father hath, is derived from his disabled parents) for they are not *medii antecessores*, between the father and the son, but *paramount*. *Courtney's Case. Common Pleas. Ceron.* fol. 141.

The law does not hinder, but that an *alien* is of the same degree and relation of consanguinity, as natural born subjects, or denizens born, the son, the father, and brother, though

aliens; the son, father, and brother, our law takes notice of as well as natural born subjects; and so it was adjudged, for he shall be preferred in administration, though an *alien*, as next of kin. *Crook. Car. 8, 9. Carson's Case.*

But in cases of inheritance, the law takes no notice of him, and therefore, as he shall not by descent, so he shall not impede the descent to the younger brother; as for instance, A an *alien*, B and C naturalized by act of parliament (all brothers) B purchases lands, and dies, *sine prole* (without issue) C shall inherit, and not A. 29 *Edw. III. Tit. Cozenage 5.*

A an *alien*, B and C his brothers, both naturalized by act of parliament; B purchases lands, and dies without issue, the same shall not come to A, nor to his issue, (though a denizen) but shall come to C and his issue; the law taking no notice of A as to impede the succession of C or his issue, though it work a *consequential disability*, to bar the issue of A parallel to what the law calls corruption of blood, which is a consequent of attainder. *Ramsay's Case. 15 Car. II. in Com. Ban.*

Again, in lineal descent, if there be a grandfather, natural-born subject, the father an *alien*, and the son a natural-born subject; the father is made a denizen, yet he shall not inherit the grandfather; and if the father dies in the life of the grandfather, the grand-child, though born after the denization, doth not remove either the personal, nor consequential impediments, or incapacity of the father.

In collateral descents, the father, a natural-born subject, has issue two sons *aliens*, who are both made denizens; one dies without issue, the other shall not inherit him. *Godfrey and Dixon's Case. Godh. 275.*

A an *alien*, marries an English woman, who is seized of lands, and has issue, the father and mother die, yet the issue may inherit the mother, *non obstante* the incapacity of the father being an *alien*. *Cro. Jac. 539. 2 Rolls Rep. 92. Vaughan 285.*

The statute *de Natis ultra Mare*, declares the issue born of an English man upon an English woman, shall be a denizen; and the construction has been, though an English merchant marries a foreigner, and has issue by her born beyond the seas, that issue is a natural-born subject. *Levinz. 59. 25 Edw. III. Cro. Car. 601.*

But if an English woman goes beyond the sea, and there marries an *alien*, and has issue beyond the sea, that issue are *aliens*. *Cro. Car. 601. Bacon's Case.*

Yet if an English woman marries an *alien* beyond the seas, and then comes into England, and has issue, they are not *aliens*, but may inherit. *Prowde's Case of Kent.*

No *alien*, or person not born within the allegiance of the king, or naturalized, or made a free denizen, shall exercise the occupation of a merchant, or factor, in any of his majesty's plantations or territories in Asia, Africa, or America, upon pain of forfeiture of all his goods, or which are in his possession, &c. 12 *Car. II. cap. 18. sect. 2.*

All such persons as shall be born on board any of the ships employed about the trade of the South-Sea company, or in any of the places which shall be discovered or possessed by the company, shall be deemed natural-born subjects. 9 *Ann. cap. 21. sect. 53.*

Aliens born, though made denizens, are to pay such duties as they did before they were made denizens. 1 *Hen. VII. c. 2. 11 Hen. VII. c. 14. 22 Hen. VIII. c. 8. f. 1.* Or merchant-strangers, are to be used in this realm, as merchant-denizens are in other countries. 9 *Hen. III. c. 3. f. 1. 5 Hen. IV. c. 7. f. 1.*

Aliens and denizens coming into this kingdom, are to be well and honestly entreated with respect to the payment of duties. 12 *Car. II. c. 4. f. 4.* Or merchant-strangers, bringing in goods, must give security to the king's customer and comptroller, to employ the money upon the commodities of this realm, or to put it in due payment here (their reasonable costs excepted), and not to export the money received for the same; upon forfeiture of all their goods, and to suffer a year's imprisonment. 4 *Hen. IV. 15. 5 Hen. IV. c. 27. Hen. VI. c. 3. f. 1. 17 Edw. IV. 1. 3 Hen. VII. c. 8. f. 1.*

A British man, sworn to be subject to a foreign prince or state, is to pay stranger's customs; but if he returns to Great-Britain, and there inhabits, he is to pay but British duties, and to have a writ out of Chancery for the same. 14 and 15 *Hen. VIII. c. 4. f. 2.*

No person, denizen, or stranger, may enter any goods, inwards or outwards, in the name of any other person than the very owner, being not sold, bargained, or contracted for, to or with any person before entry, or before the arrival of the goods in parts beyond the seas, upon forfeiture thereof, or their value; and the offender to suffer imprisonment, and make fine thereof at the king's pleasure. 3 *Hen. VII. c. 7. f. 1. 1 Eliz. c. 11. f. 6.*

One British man may custom in his own name the goods of another British man, and so may one merchant-stranger enter the goods of another merchant-stranger: but he that so enters the goods of other persons, either inwards or outwards, that the king loses his duty, forfeits the goods to the king, and the value thereof to the party grieved; and likewise all his own goods and chattels personal for ever: the prosecution to be in three years after offence committed. 1 *Hen. VIII. c. 5. f. 3, 4, 5. 2 and 3 Edw. VI. c. 22. f. 4, 5. 1 Eliz. c. 1. f. 6.*

One of the bills of every entry inwards and outwards must, in order to prevent the colouring of strangers goods, be subscribed by the merchant, his own servant, factor, or agent, with the mark, number, and contents of every parcel of such goods, as are rated to pay by the piece or measure, and the weight of the whole parcel of such goods as are rated to pay by the weight. 13 and 14 *Car. II. c. 11. f. 10.*

The lord-mayor, commonalty, and citizens of the city of London, their officers or deputies, for, and touching the offices of package, scavage, baleage, or portage of any goods or merchandize of *aliens*, or their sons born within this kingdom, or unfreemen, imported or exported into, or out of the city of London, or the liberties or ports thereof, unto, or from the parts beyond the seas, for, or concerning the receiving, or taking of any fees or rates heretofore usually taken, for, or in respect of the said offices, or any of them, might, and may receive and take the same, any thing in the act for tonnage and poundage, or any former act, to the contrary notwithstanding. *Referred to in the Act of Tonnage and Poundage passed anno 12 Car. II.*

The children of *aliens*, under twenty-one years of age, are not to trade or make entries. 13 and 14 *Car. II. c. 11. f. 10.* For other circumstances relating to *aliens*, see the articles DENIZATION, NATURALIZATION, DUTY inwards, DUTY outwards, GOODS inwards, GOODS coastwise outwards, OFFICERS, PLANTATIONS.

ALICQUANT Part is that which will not measure or divide any number exactly, without some remainder.

Thus 2 is the *aliquant part* of 7; because twice 2 wants 3 of 7, and 4 times 2 exceeds 7 by 1.

ALICQUOT Part is that part of a number or quantity, as will exactly measure, or divide it, without any remainder.

Thus 4 is the *aliquot part* of 8; 5 of 10; and 6 of 12.

All the *aliquot parts* of any number may be found by the following method; divide the given number by its least divisor, and the quotient thence arising by its least divisor, &c. till you find a quotient that is no further divisible, and you will have the prime divisor, or *aliquot parts*, of that number: then, if every two, three, four, &c. of these divisors be multiplied into themselves, the products will be the several conjoined divisors, or *aliquot parts*, of that number. For example, suppo'e the *aliquot parts* of 60 were required; divide the number 60 by 2, and the quotient will be 30, which again divide by 2, and the quotient will be 15, which divide by 3, and there remains the indivisible quotient 5: therefore all the prime *aliquot parts* are 1, 2, 2, 3, 5; and the compound ones, from the multiplication of every two, are 4, 6, 10, 15; and from that of every three 12, 10, 30.

ALKEKENG I Offinarum. Tourn. winter-cherry, a medicinal fruit produced by a plant of the same name. It is cultivated with us in gardens, flowering in July and August, and the fruit is ripe in September.

The leaves of *alkekengi* are acid and bitter: they give no tincture of red to blue paper; but the fruit gives it a very deep one. It seems at first to be sourish, but afterwards very bitter; so that it is probable there may be in the fruit a salt, resembling the *oxysal diaphoreticum Angeli Sale*, mixed with a little oil, but so involved in the leaves with

with sulphur and terrestrial parts, as not to be perceptible. *Tournefort.*

The berries have a vinous, and most penetrating juice, like wine, or that of citrous, and are therefore commended in burning fevers. The dried berries ground to a flour, and infused in wine, are a powerful diuretic, and besides move the belly; and are the more beneficial, as there is nothing in our body but urine, which inclines us to an alkaline putrefaction; wherefore alkaline diuretics are to be suspected. Half an ounce of the dried berries bruised, and taken as tea or coffee with sugar, cleanses the reins, corrects grumous blood, and helps the yellow jaundice, strangury, gout, and dropy. *Boerhaave.*

ALLAY or **ALLOY**, a word used for the tempering and mixture of other metals with silver or gold. *Stat. 9 Hen. V. 2. c. 4. and 1. c. 11.* This *allay* is to augment the weight of silver or gold, so that it may defray the charge of coinage, and to make it the more fusile. A pound weight of standard gold, by the present standard in the mint, is twenty-two carats fine, and two carats *allay*: and a pound weight of right standard silver consists of eleven ounces two penny-weights of fine silver, and eighteen penny-weights of *allay*. *Lown's Essay upon Coins, p. 19. Cowel.* One penny-weight of angel-gold is worth four shillings and two-pence; of crown-gold, three shillings and ten-pence; and an ounce of pure silver, is worth five shillings and four-pence, and with *allay* five shillings. *Mod. Just. tit. Coin, p. 120.*

Whether gold or silver be above or below standard, is found by assaying. See **ASSAY**.

When several species of coin, or ingots of different fineness, are to be melted together, the operation, requisite to find the due proportion of *allay* to the fine metal, is more difficult: and yet it is one of the most important articles a master of the mint ought to be acquainted with, and which all those also ought to know who work in gold and silver, that they may not be mistaken in the *allay* they are often obliged to make of gold or silver of different standards.

All the authors who have wrote upon coinage, have given tables for making that reduction; and the arithmeticians have their rule of *alligation*, which may also be used. But the anonymous author of a small treatise, printed at the end of *Monsieur Boissard's edition of 1721*, has given us the easiest method to practise that rule.

As that method will serve both for gold and silver coin, we shall give but one instance of it; but it must be first observed, that the calculation for the *allay* of gold is performed by the thirty-two parts, which are wanting in, or exceeding, the standard of those metals designed to be used; and that, with regard to silver, we reckon by grains of fine metal.

When any one would make that kind of *allay*, or rather evaluation of *allay*, in order to add, or diminish, what is wanting, or too much in the fineness, you must draw up a table of the metals to be melted, containing their quality, weight, and fineness. This table is afterwards to be divided into two others, the one containing all the species which are below, and the other those that are above, the requisite degree of fineness.

Each of these tables being calculated separately, you may find by the calculation of the first, how much metals that are above the standard, exceed it; and, by the second, how much is wanted in those that are below it: so that, by comparing these two products, or sums, together, we discover exactly, by means of a subtraction, how much, either of fine gold, or *allay*, must be added, in order to reduce all those metals to the standard required for the new melting. Here follows the instance, which the above-mentioned anonymous author gives us:

Numbers.	Marks.	Ounces.	Carats.
1	1	4	Jacobusses, at 21 $\frac{3}{4}$
2	2	6	Ingots, at 20 $\frac{1}{2}$
3	1	4	Ingots, at 18 $\frac{3}{4}$
4	3	6	Ducats, at 23 $\frac{3}{4}$
5	1	4	Nobles, at 23 $\frac{1}{4}$
6	1	4	Ital. Pist. at 21 $\frac{1}{2}$
12		4	

I have therefore, 12 marks and 4 ounces of gold, of several degrees of fineness, which must be reduced to the fineness of 21 carats and $\frac{1}{2}$.

Among the six articles which compose the first table, there are three, viz. the first, the fourth, and the fifth, which are above the standard; and three, viz. the second, the third, and the sixth, which are below it. I separate them into two tables.

FINE GOLD.

Numbers.	Marks.	Ounces.	Thirty-seconds.
1	1	4	remains good 9 32ds.
4	3	6	ditto 210 32
5	1	4	ditto 96 32
Sums remaining good upon these three articles			315 32ds.

INFERIOR GOLD.

Numbers.	Marks.	Ounces.	Thirty-seconds.
2	2	6	wanting 110 32ds.
3	1	4	ditto 144 32
6	1	4	ditto 12 32
Sum of what is wanting in these three articles			266 32ds.

The two sums compared.

Remains good 315
Wanting 266

Remains good 49 32ds, for which must be put 4 drachms and $\frac{1}{2}$ of copper, and then the whole will be of the standard of 21 carats $\frac{1}{2}$: the weights of the metals being consequently encreased to 12 marks and 4 ounces exactly, because of the addition of the *allay*.

There remains only to know how you may calculate the proportion there is between 49 32ds of fine gold, and 4 drachms and a half copper. But the operation is easy to one who is acquainted with the first principles of arithmetic, and knows, also, that 696 32ds good are worth a mark of copper, or 64 drachms; and that, accordingly, 53-2ds, and 5-8ths, are worth a drachm.

This example, which relates to gold above the standard, may also serve for that which is below it; but, in that case, as many 32ds are to be added as were found wanting.

The chief reasons alledged for the *allaying* of coin, are, 1. The mixture of the metals, which, when smelted from the mine, are not perfectly pure. 2. The saving of the expence that it must otherwise cost, if they were to be refined. 3. The necessity of rendering them harder by mixing some parts of other metals with them, to prevent the diminution of weight; which pieces of money might suffer in time by being often handled and rubbed. 4. The melting of foreign gold, or coin, which is *allayed*. 5. The charges of coinage, which must be made good by the profit arising from the money coined. 6. and lastly, the duty belonging to the sovereign, on account of the power he has to cause money to be coined in his dominions. See **GOLD, SILVER, and REFINING.**

The *allay* of copper for statues, guns, or bells, has also its proportions; but, as they are arbitrary, and depend on the taste and experience of the founder, it is hardly possibly to ascertain the rules of it.

Monsieur Felibien pretends that the good *allay* for statues, or brads figures, ought to be made one half of rose-copper, and half of yellow-copper, or common brads. According to others, and to *Monsieur de St. Remy* in particular, there ought to be four pounds of brads, and eight of tin, in 100 weight of red, or rose-copper. Which of the opinions is best grounded, must be left to those who have experience in the casting and *allaying* of those metals for their various purposes.

To make the mixture fit for great guns, mortars, and other pieces of artillery, the best and softest tin of Cornwall is a necessary ingredient skilfully applied. There must be 6, 7, or 8 pounds of it to 100 weight of red copper, more or less, according as this last metal happens to be of a better or worse quality.

The *allay* for bells is usually made of 20 pounds of the hardest tin to 100 weight of rose-copper.

The *alloy*, or mixture for the several sorts of pewter designed for dishes, plates, and other household utensils, is commonly made of red copper, regulus of antimony, and bismuth, or lead.

To *ALLOY*, or *ALLOY*, is to melt several metals together, in order to mix, or incorporate them with each other, that they may form afterwards but one and the same matter. Gold and iron cannot be alloyed, or duly incorporated together by melting, nor even be soldered together, with the help of copper. Tin melted with gold becomes so closely united with it, that it is extremely difficult to separate them, a small quantity being even capable to spoil a whole casting. See *ASSAY*.

Persons who purchase plate should be careful to deal with those of known honour and credit in their business, there being very great deceit and imposition therein, notwithstanding the laws, and the care of the goldsmiths company to prevent them. For the company have long complained that there are numbers who counterfeit the hall mark, because their metal is worse in point of quality, or has more *alloy* therein than the law directs; and yet the buyer pays the same price for it, as if the wrought-plate was made according to the legal standard. This is a great evil, and should be guarded against.

ALLEVEURE, or *ALLURE*, a brass coin struck in Sweden, worth about $2\frac{1}{4}$ English money.

ALLIBALLIES, a very clear fine muslin, of which the piece contains 21 yards, and is one yard in breadth.

ALLIGATION, in *arithmetic*, is the method of resolving questions relating to the mixture of commodities, and their value and effects, when united in a composition. The term is derived from *ad*, to, and *ligo*, to bind; because the numbers were formerly linked together by circular lines.

Alligation is divided into two parts or branches, *medial*, and *alternate*.

Alligation Medial, is that by which the mean rate or price of any mixture is found; when the particular quantities of the mixture, and their rates are given.

To answer questions of this nature, the sum of all the quantities proposed to be mixed, and also the sum of their particular rates must be found. Then the proportion will be,

As the sum of all the quantities is to the sum of all their rates; so is any part of the mixture, to the mean rate or price of that part.

EXAMPLE.

A goldsmith mixes six ounces of silver at 5 s. per ounce, with nine ounces at 3 s. 9 d. per ounce; what is the value of an ounce of that composition?

The question prepared as above directed will stand;

Thus $\begin{cases} 6 \text{ } \frac{3}{4} \text{ at 5 s. per ounce} & \text{comes to 360 d.} \\ 9 \text{ } \frac{3}{4} \text{ at 3 s. 9 d.} & \text{comes to 450 d.} \end{cases}$

$15 \text{ } \frac{3}{4} = \text{their sum. And their total value} = 810 \text{ d.}$
Then, as $15 \text{ } \frac{3}{4} : 810 \text{ d.} :: 1 \text{ } \frac{3}{4} : 54 \text{ d.} = 4 \text{ s. 6 d.}$ the answer required.

Alligation alternate, is that by which the particular quantities of each ingredient concerned in any mixture are found; when the particular rates of every one of these ingredients, and the mean, rate are given. This admits of three cases.

Case 1. The particular parts of any ingredients proposed to be mixed, and the mean rate of the whole mixture being given; to find how much of each ingredient is requisite to compose the mixture, when the whole quantity, or any part thereof, is not limited.

To solve questions of this nature it will be requisite to place the mean rate so, that it may be easily compared with the particular rates; in order to find every one of their differences from the mean rate by inspection only.

Then take the several differences between the mean rate and the particular rates; setting down those differences alternately, and they will be the quantities required.

Case 2. The particular rates of all the ingredients proposed to be mixed, the mean rate of the whole mixture, and any one of the quantities to be mixed being given; to find how much of each of the other ingredients is requisite to compose the mixture.

In this case, which is usually called *alligation partial*, you must set down all the particular rates, with their mean rates, and find their differences, as before, without having any regard to the quantity given. Then the proportion will be,

As the quantity found by the differences, of the same name with the quantity given, is to the given quantity: so is any of the other quantities found by the differences, to the quantity of its name.

Case 3. The particular rates of all the ingredients, proposed to be mixed, and the sum of all their quantities, with the mean rate of that sum, being given; to find the particular quantities of the mixture.

This is generally called *alligation total*, and is thus performed. Set down all the particular rates, with their mean rates, and find their differences, as before; and add all the differences into one sum. Then the proportion will be,

As the sum of all the differences, is to the sum of all the quantities given: so is every particular difference, to its particular quantity required.

The following example will be sufficient to explain the above precepts.

Suppose it were required to mix malaga, at 7 s. 6 d. the gallon, with canary at 6 s. 9 d. sherry at 5 s. and white wine 4 s. 3 d. so that the whole mixture may be ninety gallons, to be sold at six shillings the gallon: how much of each sort will be necessary to compose this mixture?

Mean price 72 d. $\begin{cases} \text{Malaga 90 d.} & -21 \\ \text{White 51} & -18 \\ \text{Canary 81} & -12 \\ \text{Sherry 60} & -9 \end{cases}$

60 = their sum.

Thence $\begin{cases} 60 : 90 :: 21 : 31\frac{1}{2} \text{ the gallons of malaga.} \\ 60 : 90 :: 18 : 27 \text{ the gallons of white wine.} \\ 60 : 90 :: 12 : 18 \text{ the gallons of canary.} \\ 60 : 90 :: 9 : 13\frac{1}{2} \text{ the gallons of sherry.} \end{cases}$

Note. The work of these proportions may be greatly shortened by dividing the second number by the first, and multiplying the quotient by the respective third numbers; for these products will answer the question.

ALLOCATION, in a legal sense, is an allowance made upon account in the Exchequer; or, more properly, a placing or adding to a thing. *Coruel*.

ALLOCATIONE FACIENDA, a writ for allowing to an accountant such sums of money as he hath lawfully expended in his office; directed to the lord-treasurer, and barons of the Exchequer, upon complaint made. *Reg. Orig.* 206.

ALLOTING, or *ALLOTMENT* of goods, in commerce, is the dividing a ship's cargo into several parts, to be bought by several persons, whose names, being wrote on as many slips of paper, are, by an indifferent person, placed on the several lots or parcels, by which means the cargo is divided without partiality, each having the lot or parcel of goods his name is fixed upon.

ALLOWANCES, to bankrupts out of their estates. When a bankrupt has in all things conformed himself to the acts made concerning bankruptcy, he shall be allowed by the assignees 5 l. per cent. out of the neat produce of all the estate that shall be recovered in and received, provided the said neat produce, after such allowance, shall be sufficient to pay the creditor ten shillings in the pound, and so as the said 5 l. per cent. shall not amount in the whole to above 200 l. and in case the neat produce, after deducting the following allowance, shall be sufficient to pay the creditors twelve shillings and sixpence in the pound, the bankrupt in this case shall be allowed 7 l. 10 s. per cent. so as that such allowance shall not amount in the whole to above 250 l. And in case the neat produce after the following allowance is deducted, shall be enough to pay the creditors fifteen shillings in the pound, the bankrupt shall be allowed 10 l. per cent. provided it does not amount in the whole to above 300 l. But if the said bankrupt's estate is not sufficient to pay the creditors ten shillings in the pound neat, as aforementioned, then, and in such case, the bankrupt shall only be allowed so much as the assignees and commissioners shall think fit, not exceeding 3 l. per cent.

ALLOWANCES,

ALLOWANCES made to the discoverers of bankrupts effects. By stat. 13 Eliz. c. 7. sect. 6. and 5 Geo. II. c. 30. sect. 20, 21. it is enacted for the better discovery of a bankrupt's estate, that all and every person who shall (after the time allowed to such bankrupt) voluntarily make discovery of any part of such bankrupt's estate, not before come to the knowledge of the assignees, shall be allowed 5 l. per cent. and such further reward as the assignees and the major part of the creditors in value, present at any meeting of the creditors, shall think fit.

ALLOWANCE on British refined sugar exported. By 9 and 10 Will. III. cap. 23. sect. 9. and 5 Ann. cap. 8. art. 6. was granted from 31 January, 1699, during the continuance of the new subsidy, upon sugar refined in Great Britain, for every hundred weight exported, 3s. By 2 and 3 Ann. cap. 9. sect. 3. 4 Ann. cap. 6. sect. 2. 5 Ann. cap. 19. sect. 8. and 1 Geo. I. cap. 12. sect. 8. was granted during the continuance of the one-third subsidy, a further allowance on the same, for every hundred weight exported, 1s.

By 6 Geo. II. cap. 13. sect. 10. was granted from 24 June, 1753, for five years, by 11 Geo. II. cap. 18. sect. 2. Further continued for seven years, by 19 Geo. II. cap. 23. sect. 1. Further continued for seven years by 20 Geo. II. cap. 32. sect. 5. Further continued to 24 June, 1756, and by 29 Geo. II. cap. 26. sect. 1. Further continued for three years. A further allowance on the same, for every hundred weight exported 2s. By 21 Geo. II. cap. 2. sect. 6. was granted from 1 March, 1747, during the continuance of the subsidy 1747; a further allowance on the same for every hundred weight exported, 3s. Total allowance 9s.

To be paid at the Custom-house to the exporter within thirty days after the demand thereof; oath being first made by the refiner, that the sugar so exported, was produced from brown and muscovada sugar, charged by the acts of 9 and 10 Will. III. cap. 23. and of 2 and 3 Ann. cap. 9. and by 21 Geo. II. cap. 2. (that is to say, charged with the new subsidy, one-third subsidy, and subsidy 1747) and that, as he verily believes, the same was imported from his majesty's plantations in America, and the duty duly paid at the time of the importation thereof; the exporter making oath, that the same was duly exported, and his majesty's searcher also certifying the shipping thereof, and all other requisites being performed, according to the book of rates.

ALLOWANCE on damaged tobacco imported. If any British plantation tobacco hath received damage on board any ship at sea, or by the ship being forced on shore in any part of Great Britain; or after arrival, by the ship's bulging on an anchor, or by the lighter into which the tobacco is put in order to be landed; the merchant refusing to pay, or secure the duty for the same, hath liberty to separate such damaged tobacco, by cutting it off from the hoghead, or other package: for every pound of damaged tobacco, so cut off, the merchant is to be allowed one halfpenny. 9 Geo. I. cap. 21. sect. 4. 13. to be paid by the commissioners or collectors, or other chief officers of his majesty's customs. But such allowance is not to exceed thirty shillings on any one hoghead. Such damaged tobacco cut off is to be burnt and destroyed. 9 Geo. I. cap. 21. sect. 4.

ALLOWANCE or drawback of the duties on coals used in melting copper or tin ores within the counties of Cornwall and Devon; or in fire-engines for draining tin or copper mines in Cornwall. All coals used in either of the above works, and for which the duties have been first answered, upon proof, by oath made before the customer or collector of the said duties, that they have been so used, shall have a drawback of all the duties; to be repaid by the collector of the duties to the person making such proof. 9 Ann. cap. 6. sect. 54. and 14 Geo. II. cap. 41. sect. 3.

ALLOWANCE on damaged, corrupt, or unmerchantable wines imported. If any merchant, finding his wine on importation to be damaged, corrupt, or unmerchantable, shall refuse to pay or secure the duties for the same; the commissioners of the customs may cause such wines to be received into the custody of the proper officers, and to be publicly sold, in order to be distilled into brandy, or made into vinegar, taking sufficient security that they

be not made use of for any other purpose whatsoever; and shall cause the produce of such sale to be paid to the merchant, as a compensation for the freight, and other charges, not exceeding the allowances following:

For every ton of wine	{	Of the growth of Germany, or			
		which pay duty as such	-	-	4 0 0
		Of the growth of France	-	-	4 0 0
		Of the growth of Spain, Portugal, or elsewhere	-	-	8 0 0

the security to be discharged, on a proper certificate that the wines have been so made use of within three months after delivery out of the warehouse.

The overplus, if any, to be replaced to the duties, out of which the warehouse rent, and other charges attending the sale, have been advanced. 6 Geo. I. cap. 12. sect. 3, 4. and 12 Geo. I. cap. 28. sect. 20.

But no allowance is to be made for any wines, unless imported in casks, on board a merchant ship, directly from the place of the growth, or the usual place of first shipping. 8 Geo. I. cap. 18. sect. 19.

Except as to ships stranded; in which case, the wines saved may be put on board any other ship or vessel, and carried to any lawful port of this kingdom, and be intitled to the aforementioned allowance. 8 Geo. cap. 18. sect. 20.

ALLOWANCE of Portage. Portage is a bounty given by the commissioners of the customs, by virtue of their patent, to masters of ships inwards, for making true reports of their ships and cargoes, and otherwise demeaning themselves according to law and custom; and is granted on the net amount of the under-mentioned branches paid or secured for the goods imported in their respective ships, certified by the proper officer of the port (damages and over-entries first to be deducted) and is as follows.

Wines 6s. 8d. per cent. on the net amount of the branches of the customs and inport. Currants 6s. 8d. Norway goods 2 l. and other goods 10s. per cent. on the net amount of the branch of customs.

Note, that no portage is to be granted, when it doth not amount to 10s. except for Norway goods.

ALLOWANCES due and payable to the officers of his majesty's customs and subsidies in the port of London, and the members and creeks thereunto belonging, viz.

For the officers of the petty customs outwards.

ALLOWANCE of Time to export by Certificate.

The merchants are *allowed*, for their shipping off tobacco, sugar, ginger, pepper, bugles, *alias* beads, cast and bar-iron, dying wood, all dying wares and drugs, eighteen months to British, and fifteen months to aliens, to have their drawback; and all other goods, twelve months to British, and nine months to aliens. 2, 3, and 9 *Ann.*

Amber beads, rough amber, coral beads, and polished coral, and all cowries, may draw back the imposts 169³/₄ exported in three years. 4 and 5 *Will.* and *Mary.*

Goods on which no drawback is allowed.

Mum, by 1 *Will.* and *Mar.* Cordage, 6 *Ann.* Hops, 9 *Ann.* Tobacco, exported in ships under twenty tons burthen,

burthen, 9 *Ann.* Tobacco, exported to Ireland, until a certificate be produced of its being landed there, 9 *Ann.* Alamodes and lustrings, 9 *Will.* III.

Since the commencement of the late war, an act passed, 30 *Geo.* II. the preamble to which recites, that the duties granted by an act of 7 and 8 *Will.* III. upon French wines, and other goods, of the growth, product, or manufacture of France, as well as several other duties upon various goods imported into this kingdom, are by law not to be drawn back upon the re-exportation thereof into foreign parts: and that as such duties have been found, in several instances, to be equal to the value of the goods taken as prize from the French, the captors have thereby so far lost the benefit of their prizes; and have therefore often been induced to carry their prizes directly to foreign parts, to the prejudice of this kingdom; and that it is therefore enacted, that any goods of the growth, product, or manufacture of France, or any of the dominions belonging to the crown of France, that have been, or shall be taken, during the war, and brought hither by any of his majesty's ships of war, or privateers, may, upon condemnation thereof as lawful prize, be landed, and secured under the king's locks in warehouses provided at the expence of the captors, with the approbation, and under the inspection of the commissioners, or other principal officers of the customs and excise, to which such goods are liable; and upon admission of such goods taken since the declaration of war, into such warehouses, there shall be paid the following duties, which shall not be drawn back or repaid upon the exportation, viz. For all such goods, (except wines and vinegar, and such goods as are herein after enumerated) of the growth, product, or manufacture of France, or any of the dominions belonging to the crown of France, taken by any of his majesty's ships of war, the half of the old subsidy granted by the act of tonnage and poundage, of 12 *Car.* II. and the whole of the further subsidy of poundage, granted by the act of 21 *Geo.* II. being what is commonly called, "The subsidy one thousand seven hundred and forty-seven;" and for the like goods taken by any private ship of war, the half of the said old subsidy, and no more; and the said duties to be paid, and applied, as they are by law appropriated, but subject to the customary and legal discounts, and *allowances* for damage; and for every ton of French wine and French vinegar, taken either by his majesty's ships of war, or privateers, the sum of three pounds; and after the same rate for any greater or lesser quantity; to be paid into the Exchequer, as part of the duties arising by the act of 18 *Geo.* II. for granting to his majesty several additional duties upon all wines imported into Great Britain; and for raising a certain sum of money by annuities and a lottery, in a manner therein mentioned; to be charged on the said additional duties.

The said subsidies are to be paid *ad valorem*, upon the oath of the captors or their agents, upon the following goods, viz. upon all sorts of woollen and silk manufactures, and hats, handkerchiefs, checks, knives, and nails, notwithstanding the same may have been rated in the book of rates of 12 *Car.* II. or the additional book of rates of 11 *Geo.* I. and are to be levied and collected, and to be under the same penalties, and forfeitures, as are directed and prescribed by the act of 11 *Geo.* I. for rating such unrated goods and merchandizes as are usually imported into this kingdom, and pay duty *ad valorem*, upon the oath of the importer; and for ascertaining the value of all goods and merchandize not inserted in the former or present book of rates, &c.

No duties or customs are to be taken for prize-goods, consisting of any military or ship stores.

Prize-goods of the growth, product, or manufactures of France, which shall be received into any warehouse, or which are now remaining in any warehouse in this kingdom, where they have been secured, under the king's locks, by the permission of the commissioners of the customs, may upon payment of the duties before directed, (if the same have been taken since the declaration of war) be exported directly from thence, without paying any further duty of customs or excise for the

same; and if taken before the declaration of war, they may be exported without payment of any duty of customs or excise whatsoever; the exporter giving security in double the value of the goods, that the same shall be exported, and not brought back again or relanded in any part of Great Britain, or the islands of Guernsey, Jersey, Alderney, Sark, or Man; which security the customer or collector of the port from whence the same are intended to be exported, is to take in his majesty's name, and to his use.

But if such goods are taken out of the warehouse, to be consumed in this kindom, the remainder of the duties which would have been payable thereon, if the same had been regularly imported by way of merchandize, are to be first paid up; and such goods, in all other respects, are to be liable to the same restrictions and regulations to which they would have been subject, if this act had not been made.

But wines which, at the time of landing, shall be damaged, corrupt, or unmerchantable, and which shall be given up to the officers of the customs, to be publicly sold, in order to be distilled into brandy, or to be made into vinegar, in manner directed by the act, of 12 *Geo.* I. for the improvement of his majesty's revenues of customs, excise, and inland duties, are not chargeable with the before-mentioned duty of 3 l. per ton.

The duties payable upon goods of the growth, product, or manufacture, of any other country or place, except France and the dominions belonging to the crown of France, which may be taken as prize, and condemned in this kingdom, are no ways lessened or altered by this act.

ALLOWANCES for Draught and Tare.

Almost all goods and merchandize imported, pay duties, and are to be delivered either by *tale*, *weight*, *measure*, or *gauge*.

Those which pay duty by *tale*, are, at the delivery, to be tallied at one, ten, twenty, &c. according to the nature of them; and as the merchant cannot (generally) have any pretence for a short entry in goods by *tale*, therefore it is supposed that (in strictness) no post-entry should be admitted of.

The goods paying duties by *weight*, are to be brought to the king's beam, and weighed, in order to adjust the true quantity for which his majesty's duties ought to be paid; for, in consideration of the different proportion which foreign weights bear to the British, the waste, &c. which may happen during the voyage, and the draughts and tares to be *allowed* on the landing, it cannot be expected that a perfect entry can be made at first; but to enable the merchant to make the nearest estimate of the true *net weight* to be entered, he will be furnished in the progress of this work with a table of the proportion which all foreign weights bear with ours, and also with the particular draughts, tares, &c. on all goods imported.

At landing the goods, the weigher is to call out the full and true gross weights in the scale, which the land-waiters (and ship's husband) are to enter in their books (and should cheque with one another every day) and from the total of the said gross weight, is to be deducted an *allowance* in consideration of

Draught, according to the following respective weights, viz. on all goods imported, weighing		
under	1 cwt.	1 lb. Dra.
From	1 to 2	2
	2 to 3	3
	3 to 10	4
	10 to 18	7
	18 to 30, or upwards	9

Except tobacco of the British plantations, which is to be *allowed* eight pounds draught only for every hoghead of 350 lb. or upwards. 9 *Geo.* cap. 21. *sect.* 15.

These *allowances* for draughts, the land-waiters may (when they are very different) insert in their books, opposite to each respective draught; or (when they are not very different) compute the same, by counting the number of the draughts at each separate *allowance*.

The

The allowance for draught being deducted, there is (in most cases) a farther allowance to be made out of the remaining weight, called

Tare, being a consideration of the outside package that contains such goods which cannot be unpacked without detriment; or for the papers, threads, bands, &c. that inclose or bind any goods which are imported loose; or though imported in casks, chests &c. yet cannot be unpacked and weighed nett.

Several sorts of goods have their tares ascertained, and those tares are not to be altered or deviated from, in any case within the port of London, unless the merchant thinking himself, or the officers the crown, to be prejudiced by such tares, shall desire that the goods may be unpacked, and the nett weight taken; which may be done, either by weighing the goods in each respective cask, &c. nett, or (as is practised in East-India goods particularly) by picking out several casks, &c. of each size, and making an average, and so computing the rest accordingly. But this must not be done without the consent of two land-surveyors, attested by their hands in the land-waiter's books; and in the out-ports, not without the consent of the collector and surveyor: and as to those goods which have not their tares ascertained, two land-surveyors in London, and the collector and surveyor in the out-ports, are to adjust and allow the same in the like manner.

Sometimes the casks, &c. are weighed beyond-sea before the goods are put in, and the weight of each respective cask, &c. marked thereon, (as is usual for most goods imported from the British plantations) or else inserted in the merchant's invoice; in which case, if the real invoice be produced, and the officers have satisfied themselves (by unpacking and weighing some of them) that those weights are just and true, they do then, after having reduced them to British weight, (if not so before) esteem them to be the real tares, and pass them accordingly; though sometimes the tares on the cask, &c. are wholly disregarded, and the real tares taken.

But the unpacking goods, and taking the nett weight, being supposed the justest method, both for the crown and merchant, it is usually practised in the port of London, in all cases where it can be done with conveniency, and without detriment to the goods.

Goods delivered by *measure*, are under three different regulations:

1. As linens particularly; which are measured by running measure, being no more than taking the length of the piece from one end to the other.

And as in the Holland, Flanders, and some sorts of German linens, the contents in British ells are often annexed to, or marked on each piece, and likewise inserted in the merchant's invoice; therefore there will not be any difficulty in making a perfect entry: so that no post-entry will be admitted in this case.

And for such linens as are contented in foreign measures, a table, which will in the sequel be inserted, proportioning them to the English, will enable the merchant readily to find their contents in British yards or ells, according as the nature of the entry shall require.

But those German, or East country linens, which are not contented, by reason the several pieces of each respective sort are generally about the same certain lengths, may be entered, by computing the whole quantity at such usual lengths, and delivered by the officers, by measuring some of the pieces, and computing the rest accordingly.

2. Such as pictures, grave and paving stones, and marble tables particularly, which are measured by square and superficial feet.

3. Such as marble blocks, and timber particularly, which are measured by solid or cubical measure.

Goods delivered by *gauge*, are wines, &c. and all excisable liquors, whose quantity to be entered may be pretty nearly determined by considering the size of the casks, and what accidental leakage, or other diminution, may have happened during the voyage.

Before any goods are delivered by virtue of any war-

rant, the same must be copied into the landwaiter's books, as a foundation for the delivery, distinguishing the date and number of the entry, the merchant's name, the total duties paid, the particular packages, with the marks, numbers, and quantities of the goods, for which the duties have been paid.

And at the delivery of the goods, underneath the said copy of the warrant, must be inserted the particular manner of the delivery, as the *tale, measure, weight, gauges*, with the respective allowances for draught and tare (where the same are to be allowed) from the total whereof, the quantity first entered being deducted, the remainder is the quantity, for which a post or additional entry is to be made; and when the same is made, the date and number of such entry must be inserted, (opposite to the said short entry) as will be illustrated by three or four examples annexed.

In making entries, it is usual for merchants to include all the goods they have on board the same ship in one, though sometimes they may happen to be of twenty several denominations, or more; and as it is enacted by 12 Car. II. cap. 4. sect. 4. (to which subsequent acts have had reference) that if any goods, or merchandizes, be brought from parts beyond the seas into this realm, by way of merchandize, and unshipped to be laid on land, the subsidy, customs, and other duties thereof, not paid, or tendered to the collector, &c. nor agreed with for the same in the custom-house, then the said goods and merchandizes shall be forfeited; therefore there was some years ago a resolution of the court of Exchequer, that, to admit of post or additional entries, where goods are short entered, (the goods so short entered being laid on land before payment of duty) is a matter of favour and indulgence, to prevent such goods from forfeiture; and though, in goods delivered by weight and gauge, it is almost impossible to make a perfect entry before landing, yet in goods delivered by tale and measure, there cannot be any excuse or pretence for a short entry, and therefore it ought not to be allowed.

Examples of the examination and delivery of foreign goods imported.

Tare thirty-six pounds per
double feron.

A B } surveyors.
B C }

Note. It is sometimes im-
ported in fingle, and some-
times in treble ferons of about
the same weight.

The draughts being noted, we shall now give an al-
phabetical account of the *tares*, as they are *allowed* at the
custom-house of London.

A.

Allum, in casks, tare 12 *per cent*.
Ashes, called pot-ashes, 10 *per cent*.
Annotto, in chests of about 180 lb. 40 lb. *per chest*.
Ashes, called weed-ashes, tare 8 lb. *per sack*.
Argol, in casks, 14 *per cent*.

B.

Barilla, in double ferons, 36 lb. *per feron*.
Battery, in fats, 8 *per cent*.
Beads, vocat. coral-beads, in casks, if covered with rags,
3 *per cent* for strings, paper, and rags; if not covered
with rags, then only 2 *per cent*.
Brimstone, in casks, tare 8 lb. *per cent*.
Bristles, in fats about 5 Cwt. tare 84 lb.
Ditto, undrest in casks, 17 lb. *per cent*.
Bugle, great, in casks, 3 ditto.

C.

Canary-seeds, in barrels of about 2 1-4th C. tare 30 lb.
each.
Capers, in casks, tare 1-3d.
Cochineal, in chests covered with skins, containing about
1 1-half C. tare 50 lb.
Ditto, in barrels, about 1 1-half C. tare 36.
But it is now usually imported in such package.
Ditto, in bales of about 200 lb. each, tare 18 lb. *per bale*.
Ditto, in ferons of about 2 C. each, tare 24 lb. *per feron*.
Ditto, in casks of about 250 lb. each, tare 42 lb. each.
Cocoa-nuts, in casks, tared according to their weight.
Coffee, in bales, from India, of about 2 1-half C. tare
18 lb. *per bale*.
Ditto, in bales, from Turkey, of about 3 C. 15 lb.
per bale.
Copper, in fats, tare 8 lb. *per cent*. but never so imported.
Copper-ore, in casks of near 2 C. each, tare 21 lb. *per cask*.
Copperas, green, in casks of about 10 1-half C. tare
10 *per cent*.

9.

Cowries, in bags, of about 1 1-half C. tare 6 lb.
per bag.

D.

DRUGS.

Aloe Succotrina, in chests, about 3 1-half C. tare 80 lb.
Ditto, in chests, of about 2 1-half C. tare 55 lb. *per chest*
for chests, and 10 *per cent*. for bladders.
Ditto Epatica, in gunny, about 100, tare 8 lb. about 2
or 300 tare 14 lb.
But in goods from the British plantations, the present
usual allowance for tare is 1-5th part.
Ditto, not of the growth, in chests, tare as on the
chests, and 20 *per cent*. for leathers.
Antimony, in casks, tare 6 lb. *per cent*.
Argentum vivum, or quick-silver, about 1 1-4th, or 1
1-half C. in boxes, barrels, and leather, tare 36 lb. in
barrels, tare 14 lb.
Asa foetida, in baskets, about 1-4th Cwt. tare 3 lb. *per*
basket.
Ditto, in chests, from India, tare 50 lb. *per chest*.
Barley bulled, or *pearl-barley*, in casks of about 4 1-half C.
tare at 45 lb. *per cask*, when they do not come tared,
or if they do, then the tare that is on them.
Bdellium, in chests of about 3 1-half C. from India, tare
60 lb. *per chest*.
Benjamin, in ditto, about 3 1-half C. tare 30 lb.
In gunny, about 100 wt. tare 8 lb. about 2 and 300 wt.
tare 14 lb.
Bole, in casks, tare 8 lb. *per C*.
Campfire, in tubs, about 1-half or 3-4ths of an 100,
tare 18 lb. but seldom imported, unless refined in small
quantities from Holland.
Cardamoms, in bales, about 200 wt. tare 14 lb.
Carraway-seeds, in canvas bales, about 300 wt. tare 10 lb.
but are scarce ever imported.
Cassia Fistula, in casks, tare as on the casks.
Cassia Ligna, in chests, about 2 C. tare 99 lb. *per chest*.
Cassia Minea, in bags, of about 1 C. tare 4 lb. each.
Cinabrium, or *Vermillion*, in tubs, about 3 1-half hund.
tare 36 lb. But the officers having been dissatisfied
with the above allowance, have on some occasions tared
the tubs, and found them on an average only to de-
serve 24 lb.
Cocculus Indiæ, in bags, about 1 C. tare 8 lb. *per bag*.
Cologuintida, in chests, tare 1-5th part.
Ditto, in bales, of about 3 1-half C. tare at 30 lb.
per bale.
Coral, unpolished, in casks, tare as on them.
Cortex Peruvianus, or *Jesuit's Bark*, in ferons, about 1 C.
tare at 14 lb. *per feron*.
Cream of Tartar, in casks, tare taken from the merchant's
invoice, not being marked on the casks.
Cubebs, in bags, tare 4 lb.
Cummin-feed, in sacks, about 2 1-half C. tare at 12 lb.
each.
Diagridium, or *Scammony*, in chests, about 3 1-half C.
tare 70 lb. *per chest*.
Diagridium, not of the growth, in chests, about 2 C.
tare at 80 lb. *per chest*, and 12 *per cent*. for boots.
Fennel-seeds, in bales, about 3 1-4th C. tare 12 lb.
per bale.
Fecbia Brugiata, in butts, about 11 C. tare 14 *per cent*.
Galangá, in bales, about 1 C. tare 10 lb. *per bale*.
Green-ginger, in jars, about 100 wt. tare 28 lb.
Gum-arabic, in sacks, about 3 C. tare 10 lb. *per sack*.
Guni-Elemi, according to the present practice, has an
allowance (besides for the outward package) of 12 *per*
cent. for the shavings that it is wrapt in.
Gum and Seed-lack, in gunny, about 1 hund. tare 7 lb.
2 or 3 hund. 14 lb.
Shellack, in chests, from India, tare as chests weigh.
Stick-lack, in chests, from ditto, about 2 3-4ths C. tare
from 100 to 110 lb. each.
Ditto, in bags, about 1 C. tare 5 lb. each.
Incense, or *Olibanum*, in gunny, 2 or 3 hund. wt. tare
14 lb. 1 hund. wt. tare 8 lb.
Ditto, from India, in chests, about 5 C. tared from 104
to 112 lb. each.
Isinglass, in fats, about 3 1-half or 4 hund. wt. tare 84 lb.
D d *Jujubes*,

Jujubes, in fats, tare 16 *lb.* per cent.

Juniper-berries, Italian, of the growth, in casks, tare as on them.

Ditto, Dutch, of the growth, in casks, about 3 C. tare at 70 *lb.* per cask.

Manna, of the growth, in chests, about 1 1-4th C. tare 50 *lb.* each.

Myrrha, in chests, from 3 1-half to 4 hund. wt. tare 92 *lb.*

Ditto, from India, in chests, about 5 C. tare 75 *lb.* per chest.

Pepper, long, from India, in bags, about 1 C. tare 8 *lb.* per bag.

Pistachias, or *Nux-pistachias*, of the growth, in chests, about 2 1-half C. tare 110 *lb.* each.

Pitch, called *Burgundy-pitch*, in stands, about 2 3-4ths C. tare 56 *lb.* but now not usually imported.

Prunelloes, in boxes, about 14 *lb.* wt. tare 3 *lb.* per box.

Rhubarb, Turkish, of the growth, in bales, about 2 3-4ths C. tared as they weigh, about 8 1 1-half *lb.* each.

Ditto, Russia, of the growth, in casks, tared as upon them.

Sal-ammiac, in casks, from Italy, tare as upon them.

Sarsaparilla, of the growth, in bales, about 1 C. tare 5 *lb.* per bale.

Tamarinds, from India, in casks and jars, tared as weighed.

Tinical, in duffers, about 1 or 1-4th C. tare 16 *lb.* about 1 1-half C. tare 20 *lb.*

Turmeric, in gunny, about 1 1-half C. tare 14 *lb.* 1 C. 10 *lb.*

Ditto, in bags, from India, about 3-4ths C. tare 6 *lb.* per bag.

Verdigrease, in leather, about 1-4th C. and 14 *lb.* tare 3 *lb.* But is not now usually so imported.

Ditto, in casks, about 6 1-4th C. tare 65 *lb.* each.

Vitriolum Romanum, in duffers, about 100 wt. tare 14 *lb.* But not usually so imported.

Ditto, in chests of about 3 C. tare 55 *lb.* per chest.

Zedoaria, from India, in chests, about 5 1-half C. tare as weighed.

Note, there are many other sorts of drugs usually imported into the port of London, which are here purposely omitted, as the method of their delivery is the same with the several examples before given, which had not their tares ascertained by the tables.

F.

Feathers, in bags, tare 4 *lb.* per cent.

Flax, undrest, tare 4 *lb.* per bobbin.

Note, this tare is for the bands round the bobbins; and when these are covered with mats, then there is usually allowed for tare 6 or 8 *lb.* per bobbin.

Flax undrest, in bales or bags, about 4 1-half C. tare 6 *lb.* each.

Fruit, in baskets, *vide* GROCERY.

G.

Galls, from Aleppo and Smyrna, in double bags, tare 7 *lb.* each, in single ditto 4 *lb.* each.

Grains of Guinea, in casks, containing about 5 C. tare as on the casks.

GROCERY.

Almonds, in casks, tare 14 per cent. In bags, 4 *lb.* per bag. In serons and bags about 200 wt. tare 18 *lb.* and so proportionably.

Note, when almonds are imported in the shells, it is the practice, in the port of London, to allow two thirds for the shells.

Anniseeds, in serons and bags, about 3 3-4ths hund. tare 18 *lb.* 3 1-half ditto, with felts, 20 *lb.* 3 1-half ditto without felts, 14 *lb.* In bales 7 C. 42 *lb.* In casks from Holland about 7 1-half C. tare as on them.

Cinnamon, in gunny, about 3-4ths or 1 C. tare 12 *lb.* In skins, said wt. 14 *lb.* In skins and bags, 16 *lb.*

Cloves, in caroteels, about 4 1-half C. tare 70 *lb.* But are sometimes passed according to the Dutch tares, marked on the casks, though usually the real tares are taken by emptying the casks and taking their weights.

Currents, in butts and caroteels, tare 16 *lb.* per cent. In quarter roll, 20 *lb.* per ditto. In bags about 400 wt. 10 *lb.* per bag.

Figs, in barrels, tare 14 *lb.* per cent. In baskets about 34 *lb.* 5 *lb.* each. In casks about 4 3-4ths C. 16 per cent.

Ginger, in bags, about 92 *lb.* tare 4 *lb.* per bag.

Mace, in caroteels, about 300 wt. tare 70 *lb.* But is usually tared as cloves.

Nutmegs, in caroteels, about 6 or 7 hund. wt. tare 70 *lb.* But is usually tared as mace and cloves, *which see*

Pepper, in bags, about 300 wt. tare 4 *lb.* per bag.

Prunes, in puncheons, or uncertain casks, tare 14 *lb.* per cent. But this allowance having by experience been found to be insufficient, there is now, in the port of London, usually allowed 20 *lb.* per cent. for the tare of the casks.

Raisins, in the baskets, tare 4 *lb.* each. In frails 6 *lb.* each. *Lipra*, in barrels, about 100 wt. 14 *lb.* each.

Solis, in casks, 12 per cent. Though on *Belvadera* and *Lipra Raisins*, in barrels, 23 *lb.* has been allowed on the first, and 18 *lb.* each on the last, as they have been found to tare as much upon an average.

Raisins, from Smyrna, the present usual allowance for tare is, for fir-casks, 12 *lb.* per cent. for oak-casks, 14 *lb.* per cent.

Sugar, from India, in bales, tare 36 *lb.* in chests 1-5th part, in casks, 1-6th part in canisters 1-8th part, in casks St. Thomas 1-5th. *Loaf-sugar*, in casks, with paper, thread, and straw, tare 16 *lb.* per cent. But the present usual allowances for tare of sugars from the British plantations, are according to the respective weights following, viz.

All small casks under 8 C.wt. tare 14 *lb.* per cent.

Every cask from 8 to 12 C.wt. Tare 1 C.

From 12 to 15 C. 1 C. 1 qr.

From 15 to 17 C. 1 C. 2 qr.

Of 17 C. and upwards 1 C. 3 qr.

Ditto, brown, from the East-Indies, in casks, about 4 1-half C. tare 70 *lb.* per cask.

H.

Hair, called *goats-hair*, in canvas, tare 4 *lb.* per cent. in hair-cloth, 7 *lb.* per ditto.

Hemp, called *steel-hemp*, in fats, tare 14 *lb.* per cent. But now not usually imported.

Hops, in bags, tare 4 *lb.* per cent.

I.

Incle unwrought. The skeins of that sort of unwrought incle, which is commonly called *short spinnal*, are about half an ell or upwards in length; and of that which is not called so, about an ell in length.

When unwrought incle is imported in bales or bobbins, the present usual allowance for tare is, for every bale or round bobbin weighing under 2 hundred wt. 6 *lb.* for every ditto weighing above 2 hundred wt. 8 *lb.* But if imported in cases or chests, it is weighed loose, and therefore not any allowance for tare.

Incle wrought, being always weighed loose, the allowance of tare is only for the papers that contain it, which according to the present practice is 2 per cent.

Indigo, in chests covered with skins, about 1 3-4ths C. tare 48 *lb.* in bales with skins, about 1-half C. tare 16 *lb.* But now not usually imported.

Ditto, of British plantations, in casks about 1-half to 2 C. tare as on them.

Iron, old bushel, in casks, about 13 hundred wt. tare 107 *lb.* each.

K.

Kettle-fats, 8 *lb.* per cent.

L.

Latten, or round-bottoms, in fats, tare 8 *lb.* tare per cent.

M.

Madder, in bales, great and small, single and double bags, tare 28 *lb.* In fats, tare 10 *lb.* per cent.

Mustard-feed, in bags about 2 C. tare 2 *lb.* per bag.

O.

Olives, if imported in large casks, must be gauged; but in small casks or jars the contents may be computed, and, according to the present practice in the port of London, have an allowance of 1-3d part in consideration of the liquor.

Oils, in certain casks, one in twenty allowed for leakage; under ten, none. In candy barrels, tare 29 *lb.* per barrel. In uncertain casks, tare 18 *lb.* per cent.

Note, 7 1-half pounds make a gallon, and 252 gallons make a ton. Though oils of all sorts pay duty by measure, yet it is not the practice to gauge them, but

if imported in uncertain casks, they are weighed, and the gross weights (after the deductions of draught and tare) are reduced to measure by accounting 7 1-half pounds to the gallon.

Train-oil, of the British plantations, in uncertain casks, is allowed 18 lb. *per cent.* but in certain casks, as barrels, it is the practice in the port of London to allow 50 lb. *per barrel* tare.

P.

Pimento, in barrels, about 2 3-4ths C. tare as on the casks.

Plat, vocat. *Bermudas Plat*, in casks, 1 1-half C. tare as on the casks.

R.

Rice, in barrels, about 4 C. tare as on the casks.

S.

Saffore, in bales, about 6 C. tare 84 lb.

In bags, from 2 to 3 C. tare 16 lb. *per bag.*

Sago, from India, in bags, about 94 lb. tare 3 lb. each.

Salt-petre, in casks, 12 lb. *per cent.*

In gunny, about 1 1-4th C. 16 lb.

In treble gunny, from India, } 18 lb.

about 1 C. 1 qr. 13 lb.

Shavings, for hats, in bags, about 8 C. 14 lb. each.

Shumack, in bags, about 3 1-half C. 10 lb.

From 2 to 3 C. 8 lb.

About 7 C. 14 lb.

Silk of Bologna, thrown, or orgazine, in short bales,

with searcloth, and cotton wool, about 2 C. tare 28 lb.

Therefore it is the practice in the port of London to

allow 14 lb. *per C.* for tare.

In long bales, with searcloth and cotton wool, about

2 C. tare 30 lb.

Of *Piedmont*, according to the practice in the port of

London, has the same allowance for tare as Bologna.

Of *Naples*, in bales, with searcloth, about 2 C. tare 18 lb.

Therefore it is the practice in the port of London, to

allow 9 lb. *per 100 lb.* for tare.

In fangots, with searcloth, about 1 1-half C. tare 14 lb.

and so downwards proportionably.

Of *Messina*, in bales, double canvas, thrown, and raw,

about 2 C. 10 lb.

In bales, with searcloth and cotton wool, } 22

about 2 C.

Therefore it is the practice, in the port of London, to

allow 11 lb. *per 100 lb.* for tare.

Silk raw, the pound to contain 24 oz.

Great pounds of 24 oz. into pounds of 16 oz.

add 1-half part.

Pounds of 16 oz. into great pounds of 24 oz.

subtract 1-3d part.

Of *Aleppo*, in long bales, with cotton-wool, about

3 1-4th C. and downwards to 23-4th, tare 32 lb.

In fangots, with cotton-wool, about 2 1-4th, } 24

or 2 1-half C.

About 1 3-4ths, or 2 C. 20

About 1 1-4th, or 1 1-half C. 18

Ardas Silk, in short bales, with cotton-wool, from } 30

3 1-4th to 2 3-4ths C.

Of *Messina*, vide silk thrown.

Of *Persia*, in bales of 1 1-4th C. 20

Of *Smyrna* and *Cyprus*, about 3 C. and upwards 16

Downwards to 2 C. 14

from 2 C. 12

Of *Bologna* and *Piedmont*, according to the practice of the

port of London, has the same allowance for tare, as

thrown silk of Bologna, that is, 14 lb. *per 112 lb.*

Silk nubs, or *huffs*, the pound to contain 21 oz.

To reduce pounds of 21 oz. to pounds of 16 oz. add 1-4th

more, 1-4th of that.

Pounds of 16 oz. to pounds of 21 oz. subtract $\frac{5}{16}$, or

multiply by 16, and divide by 21.

In bales about 2 1-4th C. tare 24 lb. each.

Silks wrought, in cases, about 1 3-4ths C. from Holland.

30 ps. for papers and packthreads, } 11 lb. 4 oz

at 6 oz. *per ps.*

Tared 18 ps. for pasteboards, papers, and } 12

packthreads, at ditto }

6 ps. for boards, papers, and pack- } 3 0

threads, 8 oz. *per ps.*

Tare 21 0

Wrought Silks are never examined on the keys, but always sent to the warehouse.

Smalts, or *powder-blue*, in casks, about 4 C. tare 10 lb. *per cent.*

Snuff, British plantation, in barrels, about 2 C. tare as on the casks.

Ditto, from the Havana, in serons and bags, tare as weigh.

Soap, called *Castile-soap*, in double serons, about 3 C. tare 30 lb.

In single serons, about 3 C. tare 16 lb.

In chests, about 2 1-half or 3 C. tare 40 lb.

Ditto, called *Italian hard-soap*, in chests, about 1 1-half C. tare 30 lb.

Succads, in chests, about 1 1-half C. tare 40 lb.

But the present usual allowance for tare is 1-3d part.

T.

Tallow, from Russia and Ireland, in casks, tare 12 lb. *per cent.*

Tea, from India, in chests, tubs, and baskets, tare as they weigh.

Thread, called black and brown, or Bridge's outnal, to have an allowance of 6 *per cent.* for want of weight.

Whited-brown, ditto.

Sifter's thread, to have no allowance (that is) if imported in certain papers to be counted, and passed according to their respective weights.

But if imported in uncertain papers, they are weighed loose, and according to the present practice, have an allowance of 12 *per cent.* for the said papers.

Tobacco, Barbadoes, in roll's upon sticks, about 1-4th C.

tare about 6 lb. *per stick.*

Bermudas, in chests, 20 lb. *per cent.*

In casks, about 3 C. 60 lb.

about 2 1-half C. downwards, to

2 and 1 1-3d C. 50 lb.

But tobacco of the British plantations in America, may not be imported otherwise than in casks, chests, or cases, each above two hundred weight. 10 and 11 *Will. III. cap. 21.*

Spanish, in barrels, about 2 1-4th hundred 28 lb.

Ditto, in half-barrels, about 1 1-4th ditto 18

Ditto, in potaccoes, with canvas 14

Ditto, in ditto, covered with canvas 16

Ditto, in ditto, covered with skins 26

Virginia, in hogheads, weighing under 300 wt. 70

Ditto, from 3 to 400 80

Ditto, from 4 to 500 90

Ditto, 500 weight and upwards 100

But now the hogheads of Virginia and Maryland are stripped off, and the real weight of the tobacco taken.

And in consideration of the merchant's charge, in opening, stripping, and making up their hogheads, after samples have been drawn, they are to be allowed two pounds *per hoghead*, which is to be deducted from the foot of the account.

Note, the damaged tobacco, for which the merchant refuses to pay duty, must be separated from the sound before it be weighed.

Tortoise-shell, in boxes and casks, tare as on them.

Turpentine, in casks, tare 1-5th part.

Twine, in mats, about 2 1-half C. tare 9 lb. *per mat.*

V.

Vermacelli paste, in cases, about 2 1-4th C. tare 80 lb. *per cent.*

W.

Wax, vocat. *Bees-wax*, in casks, about 10 C. tare 84 lb.

per cask.

Whale-fins, of British plantation fishing, in bundles, about

1 C. tare 6 lb. *per bundle.*

Wool, *Beaver-wool*, in hogheads and brizles, tare 75 lb.

in crobies, tare the cover, which is 1-3d of the whole.

Cotton-wool, tare 4 lb. *per cent.*

But if in hair-bags from Turkey, the present usual

allowance for tare is 20 *per bag.*

But if screwed with ropes from Cyprus, the allowance

for tare is, *per particular order*, 7 lb. *per cent.*

Esfridge, lambs, Polish wool, tare 4 lb. *per cent.*

Spanish wool, in bales, for cloth about 2 C. tare 28 lb.

For felts about 2 1-4th C. 14 lb.

Segovia Spanish, for felts about 2 C. 15 lb.

Carmenian wool, in bales, about 3 C. (vide *Hair*) 9 lb.

each.

Wormseeds, from Smyrna, in bales, with felts, about 33-4ths C. tare 24lb.

From Aleppo, with cotton-wool 24
Y.

Yarn, cable-yarn, in winch, from Russia, tare 28lb.
Cotton-yarn, in bales, from India, about 3 1-half C. 43

In bags, from Turkey, tare 5lb. *per cent.*

From Aleppo, in bales, with cotton-wool 28

And so downwards proportionably.

From Smyrna, in bales, with felts, about 4 C. 28

Without felts, about 4 C. 18

In fangots, without felts, about 1 3-4ths, or 2 C. 14

1 1-half C. 12

With felts, skins, and cotton 16

Irish yarn, the pack to contain 480lb. wt.

Linen-yarn, in fats, tare 12lb. *per cent.*

ALLUM, or ALUM, a kind of salt, of an acid, astringent taste.

Some derive the word from the Latin, *lumen*, light; because it gives a lustre to colours; and others from the Greek, *αλς*, salt.

The *allum* in use at present is very different from that of the ancients, for theirs was natural; whereas ours is factitious, and consists of other ingredients besides the concentered juice which the ancients called *allum*.

Allum is made of a stone, sea-weed, and urine. The stone is found in most of the hills between Scarborough and the river Tees in Yorkshire. It is of a bluish colour, and will split like Cornish slate.

The mine, before it is calcined, being exposed to the air, will moulder into pieces, and yield a liquor whereof copperas may be made; but, being calcined, it is fit for *allum*. Sometimes a liquor will issue out of the sides of the mine, which, by the heat of the sun, turns into natural *allum*.

When the mine is calcined, it is put into pits of water, supported with frames of wood, about ten yards broad, placed in a current, which turns the liquor into a receptory, from whence it is pumped into another pit of mine; so that every pit of liquor, before it comes to the boiling, is pumped into four several pits of mine, and every pit of mine is steeped in four several liquors, before it is thrown away; the last pit being always fresh mine.

Kelp is made of a sea-weed, called *tangle*. It grows plentifully on the rocks by the sea-side. Being dried, it will burn and run like pitch; when cold and hard it is beaten to ashes, steeped in water, and the lees drawn off. The boiling pans are made of lead, and placed upon iron plates, about two inches thick.

When the work is begun, they save the liquor, which comes from the *allum* which they call *mothers*; with this they fill two third parts of the boilers, and put in one third part of fresh liquor which comes from the pits. Being thus filled up with cold liquors, the fires not having been drawn out, will boil again in less than two hours time; and in every two hours the liquor will waste four inches, and the boilers must be again filled with fresh liquor.

After it has boiled about twenty-four hours, there is put into the boiler about a hoghead of the lees of *kelp*. Presently afterwards the liquor is drawn out into a settler, made of lead, where it continues about two hours, during which time most of the nitre and slime sink to the bottom.

Then the liquor is emptied out of the settler into a cooler, and about twenty gallons of urine added to it; where it continues in temperate weather, four days. The second day the *allum* begins to strike, gather, and harden about the sides, and at the bottom of the cooler.

When the liquor has stood four days, the liquor called the *mothers* is scooped out into a cistern, the *allum* remaining on the sides, and at the bottom; and from thence the *mothers* are pumped again into the boiler.

The *allum*, taken from the sides and bottom of the cooler, is put into a cistern, and washed with water, which has been used for the same purpose; after which it is roached in the following manner:

Being washed, it is put into a pan with a quantity of water, where it melts and boils a little. Then it is

pumped into a large cask, where it commonly stands ten days, and is then fit to take down for the market. *Phil. Transf.* N^o 142.

The method of making *allum* in Italy is somewhat different from the former.

M. Geoffroy had an exact information, in Italy, of the method of making *roach-allum* at Civita Vecchia. Near that city are quarries of a greyish or reddish stone, pretty hard, like the *travertin*. They calcine these stones in kilns, and then boil the calx in water over a strong fire. The water dissolves all the salt contained in the calx, and three remains an insipid earth. The water, thus impregnated, is left to cool, and the salt shoots into crystals, like tartar, about the sides and bottom of the cask, which is the *roach-allum*. *Hist. de l'Acad. Roy. des Scien.* 1702.

M. Homberg, with three parts of *allum*, and one part of any combustible matter, which turns to a coal, by a previous calcination, distillation, and ignition, in a close vessel, prepared a phosphorus, or sulphureous matter, which immediately kindled on the free access of air. But this inflammable matter cannot be produced by the acid of vitriol, nor the spirit of salt or nitre; a plain indication that the acid of *allum*, as being more subtle, has a freer ingress into the phlogistic earth, than the acid of vitriol itself. *See Mem de l'Acad. Roy. des Scien.* 1711.

Alum is a strong astringent, acid drier: the native *alum* smells something like *aqua fortis*; but the factitious has little or no smell; when thrown upon live coals, it rises into bubbles, and melts in water. The crystals of *alum* have eight sides, representing an hexagonal pyramid, with the angles cut off, or they are bounded by four hexagonal and four triangular surfaces. A solution of *alum* coagulates milk, turns the tincture of heliotropium purple, makes no alteration in the solution of corrosive sublimate, and turns the infusion of galls turbid and whitish; with salt of tartar, it concretes into a white coagulum, without any sensible heat or smoke; and often, upon mixing this solution with oil of tartar, an urinous smell is perceived; but this happens only when the *alum* has been purified with urine, as in English *alum*; but there is no such smell from the Roman.

Alum is greatly used in dyeing and colouring, neither of which can well be performed without it; for it not only fixes the colour upon the stuffs, but also disposes them to take the colour, and adds a briskness and delicacy to it.

The usual preparations of *alum* are, purification, distillation, and uction, or calcination. It is purified by being dissolved in fair water, and then evaporating and crystallizing the solution in the common manner. It is distilled like vitriol, and the first thing that comes over is an insipid phlegm, then an acrid spirit, nearly the same with spirit of vitriol. What remains in the retort, is a white, light, friable substance, called *burnt alum*; being *alum* deprived of its phlegm, and some portion of its acid, and, by a new solution and evaporation, it will shoot into crystals, as before distillation: The phlegm of *alum* would be perfectly useless, if pure; but as it contains always some portion of the acid, and also some portion of *alum*, which sticks in the neck of the retort, it becomes a very useful external application in surgical cases, for moderating inflammations, and drying ulcers. One dram of *alum*, dissolved in six ounces of this phlegm, makes an *alum-water*, which is an excellent detergent for wounds and ulcers. The spirit of *alum* is used the same as spirit of vitriol. *Burnt alum* eats away fungous flesh, and is successfully sprinkled upon linen, to absorb bad smells arising from any part of the body, *Geoffroy*.

ALLUM-WATER, is made by boiling four ounces of *alum* in a quart of clear water, till the *alum* is dissolved. If you wash with this water the prints you intend to colour, it will not only prevent the colours from sinking into the paper, but also add a lustre and brightness to them.

ALMADY, a small canoe, four fathoms long, generally made of the bark of trees; it is used by the negroes on the coast of Africa, to trade among themselves, and with the Europeans, who lie off the shore for trade.

ALMADY, is also a vessel used in the East-Indies; it is made in the form of a weaver's shuttle, except that it is square at the stern. Some of them are eighty feet long, and six or seven feet wide. They carry great store of merchandize, and with these vessels the richest Indian merchants drive their greatest trade, whether they load them on their own account, or let them out upon freight to the European merchants.

ALMANACK, is part of the law of England, of which the court must take judicial notice; *per Holt. Cb. 7. 6 Mod. 41.*

Whether the patent to the company of stationers for sole printing of *almanacks* be good or not. *See. 10. Mod. 105.*

Whether such a day of the month was on a Sunday or not, and so not a *dies juridicus*, is triable by the country or the almanack. *Dyer. 182. pl. 55.*

ALMENE, an Indian weight of about two pounds, serving to weigh saffron in many parts on that coast.

ALMONDS, a kind of medicinal fruit contained in a hard stone full of little cells, which is inclosed in a tough cottony skin.

The tree which produces this fruit, so nearly resembles the peach, both in leaves and blossoms, that it is difficult to distinguish them, but by their fruit. It grows spontaneously only in the warmer countries, as Spain, and particularly Barbary, flowering early in the spring, and the fruit is ripe in August.

Almonds are chiefly of two kinds, sweet and bitter.

Sweet ALMONDS are accounted nourishing, but, if eaten in too large a quantity, are hard of digestion. But the oil drawn from them is most in use. It is of great service in affections of the lungs, as coughs, shortness of breath; also in soreness of the stomach, and pleuritic pains. In the stone, gravel, and all diseases of the kidneys and bladder, it is of singular use, by its softening and lubricating quality.

The milky juice pressed from sweet almonds bruised and steeped in water, is very good for consumptive and pleuritic persons; for this milk contains a great many oily and balsamic parts, fit for nourishing and restoring the solid parts, moderating the violent motions of the humours, and allaying their sharpness. *Hoffman.*

Bitter ALMONDS, are mostly used outwardly as a cosmetic, being cleansing and beautifying. The oil dropt into the ear is good against deafness, and is frequently an ingredient in anodyne liniments. *Miller.*

ALMOND, a Portuguese measure for oil: an *almond* makes four gallons and two quarts.

ALMOXARIFARGO, is a duty of two and a half *per cent* paid *ad valorem* upon all bulls hides, to the king of Spain, in Spanish America, upon the exportation of these hides, which are shipped on board European vessels. Besides this duty, there is also another duty, called that of the *quinto*, but only at the rate of four rials *per* hide.

This is also an old duty paid upon the British woollen manufactures in Old Spain.

All goods in Spain, it must be observed, are rated at the Custom-house by maravedies, or rials; and the customs are paid by one or other of these denominations. The customs, called *alcavalas* (*see* ALCAVALAS) and some others, are paid in *vellon*, or copper money; the old duty, called *almoxarifargo*, and some others, are paid three quarters in *vellon*, and one quarter in *plata*, or silver money. The plate-money is fifty *per cent*. better than the *vellon* money of the same denomination. The merchants there always make up the accounts of their customs in their own books in *vellon*, and therefore, make an addition of 50 *per cent*. for such part of it as is paid in plate.

Fifteen rials vellon are a piece of eight, and thirty-four maravedies make a rial.

The duty called *almoxarifargo* is eleven *per cent*. on some of our woollen manufactures; on others not above five *per cent*.

On those goods where the *almoxarifargo* is eleven *per cent*. the old *alcavala* is no more than one *per cent*. But where the *almoxarifargo* is no more than five *per cent*. the old *alcavala* is five and a half *per cent*.

So that the duties in Spain upon an 100 maravedies only will arise thus, even to the 100th part of a maravedy, on the goods which pay the higher *almoxarifargo*. 100 maravedies are supposed to be the value of the goods.

11	<i>per cent.</i> <i>almoxarifargo</i> , quarto plata.
2	Dos per ciento—quarto plata.
1½	Uno y medio per ciento, with a premio, or addition of five <i>per cent</i> .
1	Uno <i>per cent.</i> nueva <i>alcavala</i> .
1	Uno <i>per cent.</i> donativo.
2	Dos per ciento—quarto plata.
½	Per ciento.
1	Per ciento.
2	Per ciento—quarto plata.
1	Old <i>alcavala</i> .
1½	Per ciento—quarto plata.

24½ in all; so that, by this account, the whole duties are 24½ of 100 maravedies.

But here the reader must observe, that a quarter part of some of these duties is paid in *plata*, which as said before, is fifty *per cent*. better than the *vellon*; and that there is also a premium, or addition, of five *per cent*. on one of the duties. The addition then of this five *per cent*. and also of the fifty *per cent*. will still swell the account, and add to the aforesaid 24½ *per cent*. that is to say,

The quarter part of eleven *per cent.* *almoxarifargo* is 2.75 maravedies, which, being paid in *plata*, which is fifty *per cent*. better than *vellon*, the half of 2.75 maravedies must be added, viz.

		mar. 100th part of a maravedy	
		I	37½
The quarter part of three times	dos per ciento paid in plata for the same reason must be added -		
		o	75
The premium of five <i>per cent.</i> on 1½ maravedies must amount to -		o	7½
The last duty is 1½ maravedies; and, the quarter of this being 31¼ hundred parts of a maravedy, the half of the sum should be added for its being paid in plata; but to avoid so inconsiderable a fraction, the merchants in their accounts add only the half of thirty - - - - -		o	15
		In all	2 35
The customs without these additions, amount to 24½ <i>per cent.</i> maravedies - - - - -		24	25
So that the whole custom is on every 100 maravedies - - - - -		26	60

But, where the *almoxarifargo* is no more than five *per cent*. the old *alcavala* is five and a half *per cent*. and the whole custom as follows, viz.

5	<i>per cent.</i> <i>almoxarifargo</i> —quarto plata.
2	dos per ciento—quarto plata.
1½	<i>per cent</i> , with a premium, or addition of fifty <i>per cent</i> .
1	per ciento nova <i>alcavala</i> .
1	per ciento donativo.
2	dos per ciento—quarto plata.
½	<i>per cent</i> .
1	per ciento.
2	dos per ciento—quarto plata.
5½	old <i>alcavala</i> .
1½	uno y quarto per ciento—quarto plata.

22¾, so that, according to this table, the whole duties are 22¾ *per cent*. maravedies.

But in this, as well as in the former case, for the quarto plata and the premium, additions must be made, viz.

For the quarto plata on five per cent. <i>almoxarifargo</i> - - - - -	0 62½
For the quarto plata on three times dos per ciento - - - - -	- 75
For the premio of five per cent. on 1½ maravedies - - - - -	- 7½
For the quarto plata on the last duty of 1½ per cent. - - - - -	- 15

To which add the 22¼ above-mentioned, viz. - - - - -	22 75
And the whole duty on goods, paying but five per cent. <i>almoxarifargo</i> , amounts to - - - - -	24 35

These duties of 26 $\frac{6}{100}$ maravedies, and, 24 $\frac{25}{100}$ maravedies per cent. are reckoned in vellon, or copper money.

But to shew how much this amounts to upon the real value of the British goods, it will be necessary first to fix the value of our goods, and then to shew what *gratias* are allowed, or abatements made, to the merchants out of these customs.

To begin with a comparison of the Custom-house valuation, and the real value, and particularly in the case of English bays.

A piece of bays rated at 10,000 maravedies, pays 2,660 maravedies customs.

The same has been usually sold for 20 ducats, or 220 rials plate: to which add fifty per cent. for vellon, or copper money, and it will amount to 330 rials; and these, multiplied by thirty-four maravedies, will produce 11,220 maravedies; that is, 1,220 more than the Custom-house valuation.

Now 2,663 maravedies on 10,000, is 26 $\frac{3}{100}$, or 26 $\frac{6}{100}$, per cent. but on 11,220 is not quite 23 per cent.

But, in the next place, thirty-three per cent. is abated for the farmer's *gratia*; that is, in 100 pieces of bays, the farmer of the revenue counts no more than sixty-seven, he receiving custom for no more; so that the whole 100 pieces pay only the custom of sixty-seven pieces.

Upon the payment of these customs, there is also a quarter part abated for the king's *gratia*. A quarter part of sixty-seven is 16½: this reduced the customs on sixty-seven pieces to no more than the custom on 50½.

But other allowances are also made to the merchants, which brought the customs on 100 pieces of bays down to forty-three, or thereabouts, which make an abatement of fifty-seven per cent. on the customs, which has been shewn were not above 123 per cent. of the real value of the goods, and reduced the same to about 9 $\frac{6}{11}$, per cent. on our bays.

On other goods the deductions are greater. The farmer's *gratia* is forty-five per cent. the king's *gratia* a quarter part of the remaining fifty-five, which amounts to 13 $\frac{1}{4}$, per cent. and reduced the goods to 41 $\frac{1}{2}$, per cent. of the quantity whereon the customs are paid; which is the same thing as abating 58 $\frac{1}{2}$, per cent. out of the customs, and reducing the same, on all paying the eleven per cent. *almoxarifargo*, to less than 9 $\frac{6}{11}$; on all others which paid but five per cent. *almoxarifargo*, to about 8 $\frac{1}{2}$, per cent.

ALNAGE, signifies the measure of an ell, or measuring with an ell. It is used in *Stat. 17 Ed. 4. c. 5*.

ALNAGER, or AULNAGER, is properly a measure by the ell; and the word *aune* in French signifieth an ell. An *alnager* with us, is a public sworn officer of the king's, whose place is to examine into the assize of all cloths, made throughout the land, and to fix seals upon them; and another branch of his office is to collect a subsidy or *aulnage* duty granted to the king. He hath power by *Stat. 25 Ed. III. sect. 4. cap. 1.* and several other ancient statutes; which appoint his fees, and inflict a punishment for putting his seal to deceitful cloth, &c. viz. a forfeiture of his office, and the value. *27 Ed. III. 3 R. II.* But there are now three officers belonging to the regulation of cloathing, who bear the distinct names of searcher, measurer, and

alnager; all which were formerly comprized in one person. *4 Inst. 31.* And because the subjects of this kingdom should not be abused, an office of searching is established by act of parliament. *Cowel.*

All the attempts which our forefathers made for regulating of manufactures, when left to the execution of any particular officer, in a short time, resolved but into a tax on the commodity, without respect to the goodness thereof. As is most notorious in the case of *aulnage*, which was intended for a proof of the goodness of the commodity; and to that purpose a seal was invented, as a signal that the commodity was made according to the statute: which seals, it is said, may now be bought by thousands, and put on what the buyers please. *Sir Josiah Child on Trade, p. 2. seq.*

That impositions of this kind upon foreign nations have proved highly injurious to our woollen manufactures, by giving our rivals an opportunity to supplant us therein, is well known to those who have any experience in the trade of Portugal and Spain.

A duty being imposed on woollen cloths, for the maintainance of an office to look into that manufacture, and the loyalty, as they call it, of the stuffs produced therein; the *alnager*, who had the direction of the whole, is now become only the collector of that duty, or subsidy, granted to the king, though he still holds the ancient denomination, because the collection of that subsidy was committed to him. Nor was he abridged of his measuring and searching, till, by his own neglect, it was thought proper to separate the two offices. So that there is now a peculiar measurer, distinct from the *alnager*, or collector, to allow the assize of the length and breadth of every cloth made in England and Wales.

ALOES is the inspissated juice of the plant *aloe*. There are various sorts of it in the shops, which are distinguished, either from the places whence they are brought, from the species of the plants which yield them, or from some difference in the juices themselves.

The ancients reckoned but two sorts; the one was pure, and of a yellowish colour, inclining to red, resembling the colour of a liver, and thence named *hepatic*; the other was full of impurities, and supposed to be only the dross of a better sort. Geoffroy, Commelinus, Dale, and the more accurate writers on the *Materia Medica*, range the different sorts of *aloes* found at present in the shops, in three classes, the *socotorine*, or finer; the *common*, or second sort, which is less esteemed; and the *fetid*, which is the worst of all: these two last sorts, when pure, are likewise called *hepatic*; and when very impure, *caballine*, or *horse-aloes*. The *socotorine* is bright, shining, clear, friable in the winter, somewhat pliable in the summer, of a yellowish red colour, with a purple cast: the purest sort of this kind of *aloes*, when reduced to powder, is of a bright golden colour, of an aromatic, bitter taste, and smell not unlike myrrh. The common sort of *aloes* is less clear and bright than the former, of a darker colour, and more compact texture; it is likewise drier, of a disagreeable smell, and an intensely bitter taste. The third and worst sort of *aloes*, properly called *caballine*, has been usually given only to horses: this is easily distinguished from the foregoing sorts, by its ungrateful strong smell, although, in other respects, it agrees pretty much with the common *aloes*; sometimes it is prepared so pure and bright, as not to be distinguished by the eye from even the *socotorine*. Mr. Boulduc observes, that the *socotorine aloes* contain less resin than the *hepatic*; and that the resin has little, if any, purgative virtue: he asserts likewise, that the former purges more, and with greater irritation than the latter. This observation, which appears to be perfectly just, points out the juices to which the different kinds of *aloes* may be applied: the finer sort is properest to promote or excite the menstrual flux, or to answer the like purposes, while the inferior sorts are better calculated to act as a common purge. With regard to the solubility of *aloes*, it entirely dissolves in boiling water; but a considerable portion subsides upon the menstruum's growing cold. The same inconvenience is observable in solutions of this drug made with wine, which on keeping throw off to the sides and bottom of the containing vessel, a considerable part of what they had formerly

merly taken up; while, on the other hand, proof spirit not only almost entirely dissolves the aloes, if pure, but keeps the whole suspended.

ALOSE, a sort of fish, pretty much like the sardine, or pilchard, in shape, but a great deal larger. Some will have it to be the shad, but it is quite another fish, and is very scarce in England. It is one of those fish which are called passage fishes, or fishes of a season, because it never swims out of the sea into rivers but in the spring.

The roes of *aloses* are as much valued in the East-Indies, as those of the sturgeon are in Russia; and the trade of them is not much less considerable, there being every year a consumption of many ship loads of them.

The *alose* grows to the bigness of a salmon. It is covered with large thin scales, which are easily rubbed off. Its head is, as it were, squeezed in towards the upper part of its body: its mouth is peaked, and it has no teeth. There is, on the top of its head, over its eyes, a bone, or scale, on each side, which is smooth and bright. Its tongue is blackish; its back white, inclining to yellow; its sides and belly are of a silver colour. This fish is fond of salt; and, therefore, they bait it by throwing handfuls of salt into the places where they perceive any.

It is a delicious meat, and contains a great deal of oil and volatile salt. When this fish is not very fresh, it has a sourish taste, which hurts the gums of those that eat it. There is, in its head, a strong bone, good for the stone and gravel, and for absorbing acids, for it is an *alkali*. The stomach of the *alose*, being dried and reduced into powder, is judged proper for strengthening the stomach.

ALPAGNA, an animal much like the llama and the vigona, except that its legs are shorter, and its muzzle thicker and flatter, so that it something resembles a human face. The inhabitants of Peru reckon this animal among the beasts of burthen, and make it carry 100 weight. Of its wool they make stuffs, ropes, and bags; and of its bones, tools for weavers. They even make an advantage of its excrements, using them for fuel, both in their chambers and in the kitchen. The wool of the *alpagna* easily passes for that of the vigona; and that of the latter, which comes from Peru into Spain, is almost always mixed with the former.

ALPHABET, among merchants and traders, is a kind of index, with the twenty-four letters in their natural order, in which are set down the names and surnames of those with whom open accounts are kept, and which refers to the folio of the ledger where those accounts are written in the form of debtor and creditor, serving to find easily, and without any trouble, such accounts as are necessary to be turned to.

ALPHOENIX, is only the white barley-sugar, or twisted sugar, to which they give an extraordinary name, in order to render it more valuable.

This sugar, which is thought good for colds, is made of common sugar, which is boiled till it becomes easy to crack, when they pour it upon a marble table, greased with oil of sweet almonds, and mould it into various figures with a brass crotchet. Is easy to falsify it with starch.

ALQUIER, also called *Cantar*, is a liquid measure used in Portugal for oil: it contains six cavades, or canadores. Two *alquiers* make an almude, or almond. See **ALMOND**.

ALQUIER is also a dry measure for grain at Lisbon. It is very small; for no less than 240 *alquiers* are requisite to make nineteen septiers of Paris, or one last of Amsterdam, or thirty-eight bushels of Bourdeaux. Sixty *alquiers* make about three English quarters, and two and a half *alquiers* an English bushel.

The measure of Oporto in Portugal is also called *alquier*, but is twenty *per cent.* bigger than that of Lisbon; so that the tun yields but eighty-seven *alquiers* of Oporto, which must be understood proportionably of the other measures, the evaluation of which has been given above.

The corn exported from the isle of St. Michael into that of Madeira affords four *alquiers* advantage, or profit, *per sixty*; and sixty at St. Michael's produce sixty-four at Madeira, which is an advantage of $6\frac{2}{3}$ *per cent.*

The *alquiers* are also in use in other places of the king of Portugal's dominions, particularly in the *Azores* islands, and in the isle of St. Michael; and in those two places, according to Monsieur Ricard, the muid, or bushel, contains sixty *alquiers* there, and 240 *alquiers* make a last of Amsterdam.

ALQUIFOU, or **ARQUIFOU**, as the merchants spell it, is a sort of mineral lead ore, very heavy, easily reduced into powder, and hard to melt. When it is broke it parts into shining scales, of a whitish colour. The potters use it to give their works a green varnish; and in England it is commonly called *potter's ore*.

The *alquifou* is exported from England in large lumps of various sizes and weights. The proper choice of it should be in large lumps, very heavy, the scales bright, and resembling tin-glass.

The peasants of Durfoit, in the diocese of Alais in France, who work at the lead mine which is near that place, give the name of *archifou* to the lead ore they take out of it. The quantity they can get is not considerable; and, therefore, they work at it only when they have nothing else to do. It is used for a varnish in earthen ware. That varnish is in great request among the potters. The shining and crystalline stone with which the *archifou* is mixed, is of no manner of use.

Though there is some *archifou* in Languedoc, great quantities are sent thither from England, as also from Leghorn, and some from Barbary and Sardinia.

ALSACE, a province formerly belonging to Germany, but almost entirely yielded to France by the peace of Munster. It is separated from Imperial Germany by the Rhine, and bounded on the north by the palatinate of the Rhine; on the east the Rhine separates it from the marquisate of Baden, and from the countries of Ortenau and Brisgau; on the south it is bounded by Switzerland, and by the principalities of Montbelliard and Porentrai; and, on the west, the mountains of Vonge, or Vosge, part it from Lorrain.

There is not so great a trade in this province as one might expect from the fruitfulness of its soil, and from the abundance of commodities proper for trade which are here to be met with. It is very probable that the inhabitants neglect applying themselves to trade for no other reason, but because being naturally idle, and finding all the necessaries of life within their own country, but few of them care to trouble themselves with the labour and cares which unavoidably attend an extensive commerce, particularly that which is carried on with foreigners. And, indeed, a gentleman well known for his integrity, and for the considerable employments he has filled in Alsace during thirty years, and by the military posts to which his merit had raised him by degrees, observes, in the Memoirs he was pleased to communicate concerning the trade of this province, that the indolence of the people, or their love of repose and quietness, is so great, that, during the wars, which continued for near half a century, without hardly any interruption, between Germany and France, none of the inhabitants would engage in any commission for the French armies, though the sums employed for provisions, artillery, magazines for soldiers upon the march, extraordinaries of war, fortifications, &c. amounted yearly to above eight or 10,000,000 livres. There were only a few bankers of Strasburg, the capital of this province, and these not very rich, who made some remittances of money for the troops. That gentleman adds, that it is from the same principle of their natural indolence, that the inhabitants of the *Upper* and *Lower Alsace* suffer the peasants of Switzerland, who come thither every year, to gather their corn, cut their hay, and manage their vintage; though by that means great sums of money are yearly carried out of their country, which they might save, had they but industry enough to do their work themselves.

Strangers, therefore, carry on the greatest part of the trade of *Alsace*, importing such commodities as the province wants, and exporting great quantities of its produce. This trade extends very far into Germany on one side, towards the Upper Rhine, and, on the other, into all the countries situate from Strasburgh to the mouth of that river.

The trade of *Straßburg* consists in tobacco, brandy, madder for dying scarlet, saffron, leather, tallow, wood, and large cabbages.

Part of these commodities are carried to Mentz, and into Holland; and of cabbages only, which seem a very trifling article, there are sold in these two places to the value of above 30,000 crowns every year.

The manufactures are mockado and bergamo tapestries, small woollen cloths, blankets, fustians, and linens of hemp and flax. There is likewise a copper mill, and a mill for spices. At *Straßburg* the magistrates alone carry on the trade of wood for fuel, which they sell even to eight livres *per* cord; nor will they suffer any private person to have a warehouse of such wood in the city, nor even in the neighbourhood.

It must be observed, with regard to this trade of wood, that, though the province of *Alsace* abounds with all sorts of wood, yet most of what is consumed at *Straßburg* comes from the other side of the Rhine, even in war time; by which means above the value of 200,000 livres is yearly sent out of the kingdom, without the least profit to the king's subjects.

The tanneries are also pretty considerable at *Straßburg*; but they scarce tan any other but what they call small leather, as chamois, goats, and sheep's skins; on which the city takes a duty of four sols *per* skin.

The trade of the rest of the province consists, first in timber, which *Lower Alsace* produces in abundance, most whereof is fit for ship-building, and is sent to Holland by the Rhine. Secondly, in wine of *Upper Alsace*, which is likewise exported into Holland, whence it is sent into Sweden and Denmark, where the Dutch sell it for Rheinish, or old hock.

Thirdly, in brandy and vinegar, which are made in those places whence they get the wine: these are designed partly again for Holland, and partly for Germany.

Fourthly, in wheat, rye, and oats, which grow both in *Upper* and *Lower Alsace*, and of which the Switzers buy up great quantities.

Fifthly, in hogs and other fattened cattle, which are almost all consumed within the country.

Sixthly, in tobacco, of which they sell above 50,000 quintals *per annum*, in Switzerland, Germany, Lorraine, and in the towns on the river Saar.

Seventhly, in saffron, turpentine, hemp, flax, tartar, tallow, gun-powder for fowling-pieces, chestnuts, prunes, and other fruits, and also in all other sorts of herbs and plants, as onions, cabbages, poppies, anise and fennel, and most other kind of seeds.

The trade of all these commodities, and particularly of seed, is very considerable, France, as well as Holland, taking off a great deal. As for chestnuts, prunes, and other fruit, the greatest demand they have for them is from Cologne, Frankfort, and Basil.

It must be observed, with regard to the trade which these two last cities have with *Alsace*, that it is almost entirely carried on by land-carriage, because of the danger there is in sending merchandizes by water, it being very difficult to draw vessels along the banks of the Rhine, and the rapidity of that river rendering the navigation of it very dangerous.

There are a great many manufactures in *Alsace*, but not of any very dear or very fine stuffs; the most considerable being of tiretaries, half of wool and half of thread, of buckram, canvas, and some linens.

The tiretaries and linens are consumed in the province; the canvas and buckram are sent into England, Holland, and Germany.

There are in *Alsace* mines of silver, copper, iron, and lead; none, except the iron mines, are plentiful; these lie towards Belfort. The silver, copper, and lead mines are at Giromani, St. Maria of the mines, Astenbarc, and Munster.

The silver mine of Giromani produces yearly about sixteen hundred marks of fine metal: that of copper, or rather of silver, which affords also copper, above twenty-four thousand weight of this last metal. But the expence of working these mines is almost equal to the advantage; and the duke of Mazarine, who owns them, does not get from them above five or six thousand livres a year clear profit. For preparing and melting the iron

ore of the mines of Belfort, there are several forges and furnaces in the neighbouring forests; and for those of copper, a great many furnaces and mills.

Monsieur Mackout of Hirscheim, knight of the military order of St. Lewis, of the body of the nobility, and a magistrate of the city of *Straßburg*, set up, in the year 1730, a manufactory of cast steel. It was after a considerable labour, and great expence, that this worthy magistrate carried that manufactory to a great degree of perfection: nor was it without meeting with innumerable difficulties, and great opposition; but at last he demonstrated, that it is possible to make in *Alsace* as good steel as that which they got from Germany, or was made in Sweden, Stiria, Carinthia, Tyrol, or any where else. The court of France being informed of the success of this new manufactory, the king honoured it with his royal protection, by granting to the Sieur Mackout an exclusive privilege for the whole province of *Alsace*.

ALSINE, the name of a plant, vulgarly called *chickweed*. Botanists enumerate twenty-two species of this plant; but that used in physic is the *alsina minor* of Park. 760. *Tourn. Inst.* 245. *Boerb. Ind.* A. 209. Dale says that it refrigerates and moistens, and has the virtues of pellitory of the wall, only it has no astringency: that it is very nutritive, and therefore a wholesome food for persons in an atrophy or phthisis.

ALTERATIVES, in *physic*, signify such medicines as induce a change in the blood and juices for the better, without any manifest operation or evacuation. *Alteratives* therefore must generally be either such remedies as destroy some prevailing acrimony in the *primæ viæ*, or in the juices; or else such as resolve concretions in the blood-vessels, and dispose them, when thus resolved, to pass out of the body by perspiration, or some of the least remarkable evacuations.

ALTERNATION, a term used to express the different changes or combinations in any proposed number of things.

The method of finding the number of changes, is by a continual multiplication of all the terms in a series of arithmetical progressionals, whose first term, or common difference, is unity or 1, and the last term the number of things to be varied. Thus if it were required to find the number of changes that might be rung upon six bells: the $1 \times 2 \times 3 \times 4 \times 5 \times 6 = 720$, the number of changes required. In like manner you will find the number which can be rung upon twelve bells $= 479001600$.

ALTHŒA, *marsh-mallow*, a plant much used as an emollient.

The roots of *marsh-mallow* are pretty large, thick, woody, and tough, and much branched, of a yellowish colour on the out-side, and whitish within, slimy and mucilaginous. The stalks grow to above a yard high, soft and downy; the leaves are covered with soft *pili* like velvet, of a yellowish-green colour, more angular, longer, and sharper than the common mallows. The flowers are also like the common in shape, but less, of a paler red colour, and without the deeper coloured veins; and when they are fallen, come like seeds, set together in a round, like cheeses. It grows in salt marshes, and maritime places, flowering in July.

The root and leaves, and sometimes the seed, are used. They are mollifying, digesting, and suppling, of great use in the strangury, gravel, and stone; in heat and acrimony of urine; against sharp corroding humours in the stomach and guts, which sometimes excoriate them, and cause dysenteries. They are likewise balsamic and pectoral, good to help a cough, hoarseness, and soreness of the *aspera arteria*. They are frequently ordered in clysters for the stone, and in cataplasms and fomentations against swellings and inflammations, and to ease pain; as also to suppurate and ripen tumours and imposthumes. Miller.

The leaves of the *marsh-mallow* are glutinous and insipid, and give no tincture of red to blue paper. Its roots have the same taste, but they stain it a little. Its glutinous juice, which appears to be a mixture of a great deal of phlegm, a considerable quantity of earth, acid, and sulphur, so clogs the acrid salt, that it cannot discover itself but by the fire; for it is certain, that by a chemical analysis, we obtain from the *marsh-mallow* a concrete,

concrete, volatile, and fixed lixivial salt. The acid is a little more disentangled in the roots, because they give a faint red colour to blue paper; nevertheless, in all probability, this plant operates chiefly by its glutinous juice, which the fire entirely destroys. *Martyn's Tournefort.*

ALTIN, a money of account in Muscovy. It is worth three copecks, 1000 of which make a ruble, worth about four shillings and six-pence sterling. See **RUSSIA**.

AL TOM, a name given in several parts of the grand seignior's dominions, particularly in Hungary, to what the Europeans commonly call a *sequin*. However, that name is seldom given but to *sequins* stamped with the Turkish monarch's stamp.

ALUDEL, in chemistry, an earthen pot or tube without a bottom used in sublimations. See *Subliming FURNACE*.

ALYPUM, **ALIPIA**, or **ALIPON**, in botany, the name of a plant, called in English *herb-terrible*.

In a memoir sent from Montpellier, to the royal academy of sciences, in the year 1712, notice is taken of the *alypum* of Montpellier, which is there said to be different from the *alypum* of Dioscorides; but if the description of Dioscorides be compared with that of more modern authors, and also the medicinal virtues attributed to it by each, it will appear that the ancient and modern *alypum* is the same plant.

It grows on hills, flowers in spring, and the herb is used. It is said to be a violent purger. Clusius assures us, that the decoction has been given with great success in the *lues venerea*. *Dale.*

AMADABATH, one of the biggest cities in the Mogul empire, is seated within eighteen leagues of Cambaye, and forty-five of Surat, on a little river which falls into the Indus. Its commerce is equally flourishing both at home and abroad, sending yearly large caravans to Agra, and transporting to Surat, Cambaye, and Brochia, its manufactured stuffs, and other merchandizes; the products of the country are brought there in return of their caravans.

It is reckoned there are twenty-five great towns, and above three thousand small ones, in the jurisdiction of this city, whose inhabitants are almost employed in working for the fabricks; of which the principal ones are of silk or cotton, pure, or mixed with one another, being a species of goods peculiar to the country, such as tulbandes, alligias, attelassics, baffetas, and chites; here are also made brocades, gold and silver stuffs, damasks, satins, taffeties, and velvets of all colours, alcatiffs or carpets, with gold, silver, silk, or stuff grounds; in fine, all sorts of cotton cloth, white or painted, which in fineness, beauty of designs, and vivacity of colours, do not yield to any in the Indies.

The greatest, or at least the best and most beautiful part of these manufactures, are destined for Surat; the Banians, who transact almost all the business of this last place, and are here as brokers to the European merchants, having their factors on the spot, who buy up the goods as soon as made, or being the undertakers themselves, have artificers to work for them. The products of the country are indigo, (which is cultivated and prepared abundantly in the territory of this capital, particularly at Sirches, which, though but a small town, has acquired great reputation by their perfect ordering of this drug) sugar-candy, and sugars, all sorts of sweet-meats, cummin, honey, lack, opium, borax, ginger, dry and candied, mirabolans, saltpetre, sal ammoniac, ambergrease, musk, and diamonds; but these three last commodities are brought from abroad, and re-sold to foreign merchants. It is here that the English and Dutch have their linen stained, and their saltpetre refined; and it is from this city, that all the blue cloths come, which are sent to Persia, Arabia, the kingdom of the Abissines, the Red-Sea, the coast of Melinda, Mosambique, Madagascar, Java, Sumatra, Macassar, and the Molucca islands.

AMAIN, a sea-term, signifying, at once. Thus, when they are hoisting up any thing, and desire to have it lowered all at once, they say, "amain let go," or, "let go amain." That is, let go at once.

AMALGAMA, in chemistry, is a substance produced by an incorporation of mercury with a metal. The chemical character for an *amalgama* is *a. a. a.*

The learned Boerhaave has specified the best methods of making an *amalgama*, which are as follows:

1. Melt some of the purest lead in a clean iron ladle, and then put into it an equal quantity of mercury, and stir them about with an iron rod: let them grow cold, and you will have an homogeneous mass of a silver colour, which will be considerably hard, but by rubbing will grow softer and softer: put this mass into a glass-mortar, rub it, and then add to it what quantity of mercury you please, and it will be united with it as salt with water.

2. An *amalgama* of tin is made exactly in the same manner; and this will also receive more mercury.

3. Take a solution of the best copper in *aqua fortis*, so much saturated with the metal, that it will dissolve no more; dilute this with twelve times as much clean water: into this liquor, when hot, put plates of polished iron, and the copper will be precipitated to the bottom, in the form of a powder, and the iron will be dissolved: proceed in this manner till all the copper is precipitated; pour off the liquor, and wash the precipitated powder with hot water, till it is perfectly insipid: dry the powder perfectly, put it into a glass-mortar, and, by rubbing, incorporate with it an equal weight of hot-mercury, and they will unite into an *amalgama*; which will also receive a further addition of mercury. An *amalgama* of copper, in any other manner, is very difficult to make.

4. Pure silver, precipitated from *aqua fortis*, may, in the same manner, be made into an *amalgama*.

5. Dissolve the purest gold in *aqua regia*, till it can take up no more; dilute the solution with twelve times as much pure water; put into it some polished plates of copper, and a powder of gold will be precipitated to the bottom of the vessel, and upon the copper. Let it stand hot, till the liquor will no longer be rendered turbid by an addition of copper; shake the plates, that all the gold may fall to the bottom; pour off the liquor, wash the precipitated powder with water, dry it, and then, in a glass-mortar, reduce it to an *amalgama* with mercury; and afterwards it will receive more mercury, like the other *amalgama*. Or, take a mixture of gold and silver, coppel it with lead, and by means of good assaying *aqua fortis*, separate the silver; then wash the black powder of gold that remains at the bottom, dry it, and whilst it is hot, rub it with mercury, and it will be perfectly reduced to an *amalgama*, which will receive more mercury, as before. All *amalgamas* are white from whatever metal they are made.

By these methods an *amalgama* may be made, without loss, from all metals, except iron: there are also other ways of doing it, but not without considerable loss of mercury, and danger from the fumes. Hence we see that mercury is the true solvent fluid of metals. For the uses of these *amalgamas*, see **GILDING**.

AMALGAMATION, the uniting metals with mercury. See **AMALGAMA**.

AMAN, a sort of blue cotton cloth, which comes from the Levant by the way of Aleppo.

AMASIA, a province of *Asia Minor*, is bounded on the north by the Euxine-Sea, on the east by Armenia, on the west by Anatolia Proper, and on the south by Caramania and Aladulia. It is divided into three districts, viz.

Pontus Galaticus, Pontus Polemoniacus, and Pontus Cappadociæ.

Pontus Galaticus, is situate on the northern side of Galatia, having the Euxine on the north, and Pontus Polemoniacus on the east. The chief place is

Amasia, called by the Turks *Amassan*, which, though advantageously situate on a navigable river, large enough to carry ships of the greatest burthen up to the town from the Euxine-Sea, has no considerable commerce. The chief is a manufacture of red linens, which are called Levantine cloths.

Pontus Polemoniacus lies along the same Euxine coast, having the Galaticus on the west, and the Cappadocius on the east. Its chief city is

Næocæsaria, or *Tocat*, which was burnt down about the beginning of the present century, to the ruin of a great number of merchants, who had considerable warehouses in it.

Its excellent situation for trade is an effectual means to recover it from such a disaster. It is, indeed, rightly looked

looked upon as the center of the Asiatic commerce. The caravans of Diarbeker come hither in eighteen days (men on horseback perform the journey in twelve.) Those from Tocat to Sinope go it in six, and to Prusa in twenty; and those that go hence to Smyrna, without turning to Prusa or Angora, take up about twenty-seven days with mules, and forty with camels. Those caravans carry on a very considerable commerce into all these parts, as well as into Persia. One of the chief manufactures of this place is the filken, in which are used vast quantities, not only of the Turkish, but also of the Persian silk, in making light stuffs, buttons, frogs, &c. The next is that of leather, which is chiefly of the yellow colour, and is carried by land to Sanfon, a small sea-port on the Euxine, and thence into all parts of Turkey and Europe. Some red linens are likewise here manufactured, which though inferior to those of Persia, are sent in great quantities into Muscovy, Tartary, and even into France. They are called Levantine cloths, but are chiefly made here and at *Amasia*. But the most considerable manufacture of *Tocat*, is that of copper, which they work here in great quantities, and in variety of utensils, such as pots, kettles, candlesticks, &c. which they send to Constantinople, Egypt, and other parts. They have their copper from the mines of Trebizond and Cassamboul, the former about three, and the latter about ten days journey from their city. About a mile out of *Tocat* is a large village, chiefly inhabited by Christians, who are mostly employed in tanning of leather. The greatest part of the people about *Tocat*, even as far as thirty or forty miles, are employed in the iron and copper manufactures.

Pontus Cappadocius extends from the Polemoniacus eastward, quite to Cholcis and the frontiers of Georgia; having the Lesser Armenia, and the river Euphrates, for its southern, and the same Euxine-Sea for its northern boundaries. Its chief place is

Trepizond, formerly one of the most flourishing cities of Asia, but now almost in ruins, and its harbour capable only of receiving saics; which, however, carry some of the goods of Armenia and Persia to Constantinople from this port; so that it may be yet said to have the best trade of any in the Black-Sea.

The AMAZONS RIVER, in America, begins at the foot of the mountains called *Cordillera*, about eight or ten leagues east of Quito in Peru. It runs first from west to east, turns afterwards south, and then, after many windings and turnings, holds its main course east, till it falls into the Atlantic ocean. Its fountains and mouths are very near under the equator, and the main of its stream is under the fourth and fifth degrees of south latitude. The rivers which fall into it on the north side, rise about one or two degrees north latitude; and those on the south side, begin some of them in ten, some in fifteen, others in twenty degrees south latitude. Its channel from Junta de los Reyes, about sixty leagues from its head, till it is joined by the river Marañon, is from one to two leagues in breadth. From thence it is from three to four, but grows broader as it advances towards the Atlantic ocean, into which it falls by a mouth fifty or sixty leagues broad, between Cape North, on the coast of Guaiana, and Cape Zaparate, on the coast of Brazil. From the spring-head to its mouth, it is 8 or 900 leagues in a direct line, but the windings and turnings make it about 1200. The rivers which run into it on the right and left, have their course from 100 to 600 leagues in length, and their banks are well inhabited by multitudes of people. The nations who inhabit about this, and the other rivers that run into it, are reckoned one hundred and fifty; and their villages so thick in many places, that they are within call of one another. Among these people, the Homagues, who live towards the head of this great river, are mostly noted for their manufactures of cotton; the Corospares for their earthen ware; the Surines, who live between latitude five and ten, for their joiners work. They make war upon one another, to purchase slaves for their drudgery, but otherwise treat them kindly enough. Their forests afford materials for building the largest ships. They have many trees of five or six fathoms round in the trunk, and inexhaustible stores of ebony and Brazil-wood, cocoa, tobacco, sugar-canes, cotton, a scarlet dye called rocou, besides gold and silver in their mines, and in the sand of their rivers.

Among the rivers that fall into the great one, the Napo, Agarie, Puromaye, Janussape, Corupatube, and others, have gold in their sands. Below Corupatube, there are mines of several sorts in the mountains. In those of Yaguare there are mines of gold; in Pieora there are mines of silver; on the river Paragoche there are precious stones of several sorts, and mines of sulphur, &c. near other rivers. On the Amazons river, about 200 leagues from the sea, there is a bosphorus, or freight, one mile broad, where the tide comes up, so that it may serve as a key to all the trade of those countries. But the Portuguese being already possessed of Pora, on the side of Brazil, Corupa, and Esthero, on the side of Guaiana, and Cogemina, an island at the mouth of the river, they may, by fortifying the island of the Sun, or some other place in its chief outlet, be masters of all the trade. The people know not the use of money, but barter one thing for another, and will give 20 s. worth of provisions, &c. for a glass-bead, or Jew's-harp.

AMBASSADOR, a person sent in a public manner from one sovereign power to another, and supposed to represent the power from which he is sent. The person of an ambassador is inviolable. *Ambassador* is, in popular language, the general name of a messenger from a sovereign power; and sometimes, ludicrously, from common persons. In the judicial and formal language, it signifies particularly a minister of the highest rank residing in another country, and is distinguished from an envoy, who is of less dignity. *Johnson*.

An *ambassador* is a person sent by one sovereign prince to another, to transact in the place of his sovereign, such matters as relate to both states. 1 *New. Abr.* 85.

An *ambassador* and *agent* are the same thing, if we consider only the function of their charges: only in this they differ; an *agent* hath charge to represent the affairs only; but an *ambassador* ought to represent the greatness of his master, and his affairs. *Molloy de Jure Maritimo*, b. 2. ch. 10. *sect.* 1.

Ambassadors are in two capacities, either ordinary or extraordinary: the ordinary *ambassadors*, are those who are commanded to reside in the place whither they are sent, unless they receive letters of revocation; and as the time of their return is indefinite, so their business is uncertain, arising out of emergent occasions; and commonly the protection and affairs of the merchants is their greatest care. The extraordinary are those who are employed upon some particular great affairs, as condolences, or congratulations, or for overtures of marriage, &c. their equipage is generally very magnificent and illustrious, and they may return without requesting leave, unless there be a restraining clause in their commission. *Molloy ib. sect.* 2.

By the laws of nations, none under the degree of a sovereign prince can nominate or send any in that quality; nor can any subject send or receive any *ambassador*, be he ever so great; if a viceroy do it, it is no less than high-treason; and so it was declared when the Scots, *inconsulto principe*, sent Loudon and others, in quality of private commissioners, to treat with the French king, Lewis the Thirteenth, in the name of the whole nation, for assistance; the king would not admit or hear them. So did Queen Elizabeth, when Christopher Assonville came into England in quality of minister of state, sent from the duke of Alva, then governor of Flanders, she refused to admit him, he not having any commission or credentials from the king of Spain. It is true, the electors and princes of Germany have obtained the privilege of sending and the reception of *ambassadors*; but that is limited only to matters touching their own territories, and not the state of the empire. And so likewise the Hans-towns may do the same; for they claim the like privilege, they being free imperial cities, and partake of the same regalia, either by prescription, or by grants from former emperors, whose necessities forced them to part with such royal flowers of the empire. They generally send for their *ambassadors* two persons; one of great birth, and who hath been a soldier, to maintain decency; and the other a doctor or lawyer, to regulate affairs with learning, and by the pen. *Molloy ib. sect.* 4.

Stat. 7 Ann. cap. 12. A. D. 1708. An act passed for preserving the privileges of *ambassadors*, and other public ministers of foreign princes and states.

Señt. 1. Whereas several turbulent and disorderly persons, having in a most outrageous manner, insulted the person of his excellency Andrew Artemonowitz Matueof, *ambassador* extraordinary of his czarish majesty, emperor of Great Russia, her majesty's good friend and ally, by arresting him, and taking him by violence out of his coach in the public street, and detaining him in custody for several hours, in contempt of the protection granted by her majesty, contrary to the law of nations, and in prejudice of the rights and privileges, which *ambassadors* and other public ministers, authorized and received as such, have at all times been thereby possessed of, and ought to be kept sacred and inviolable; be it therefore declared, &c. that all actions and suits, writs, and processes, commenced, sued, or prosecuted against the said *ambassador*, by any person or persons whatsoever, and all bail-bonds given by the said *ambassador*, or any other person or persons on his behalf, and all recognizances of bail given or acknowledged in any such action or suit, and all proceedings upon or by pretext or colour of any such action or suit, writ or process, and all judgments had thereupon, are utterly null and void, and shall be deemed and adjudged to be utterly null and void, to all intents, constructions, and purposes whatsoever.

Señt. 2. And be it enacted by the authority aforesaid, that all entries, proceedings, and records against the said *ambassador*, or his bail, shall be vacated and cancelled.

Señt. 3. And to prevent the like infolences for the future, be it further declared by the authority aforesaid, that all writs and processes, that shall at any time hereafter be sued forth or prosecuted, whereby the person of any *ambassador*, or other public minister of any foreign prince or state, authorized and received as such by her majesty, her heirs or successors, or the domestic servant of any such *ambassador*, or other public minister, may be arrested or imprisoned, or his or their goods or chattels may be distrained, seized or attacked, shall be deemed and adjudged to be utterly null and void, to all intents, constructions, and purposes whatsoever.

Señt. 4. And be it further enacted by the authority aforesaid, that in case any person or persons shall presume to sue forth or prosecute any such writ or process, such person or persons, and all attorneys and solicitors, prosecuting or soliciting in such case, and all officers executing any such writ or process, being thereof convicted, by confession of the party, or by the oath of one or more credible witnesses, before the lord-chancellor, or lord-keeper of the great-seal of Great-Britain, the chief-justice of the court of Queen's-bench, the chief-justice of the court of Common-pleas for the time being, or any two of them, shall be deemed violators of the laws of nations, and disturbers of the public repose, and shall suffer such pains, penalties, and corporal punishment, as the said lord-chancellor, lord-keeper, and the said chief-justices, or any two of them, shall judge fit to be imposed and inflicted.

Señt. 5. Provided, and be it declared, that no merchant, or other trader whatsoever, within the description of any of the statutes against bankrupts, who hath or shall put himself into the service of any such *ambassador* or public minister, shall have or take any manner of benefit by this act; and that no person shall be proceeded against as having arrested the servant of an *ambassador* or public minister, by virtue of this act, unless the name of such servant be first registered in the office of one of the principal secretaries of state, and by such secretary transmitted to the sheriffs of London and Middlesex for the time being, or their under-sheriffs or deputies, who shall, upon the receipt thereof, hang up the same in some public place in their offices, whereto all persons may resort, and take copies thereof without fee or reward.

Señt. 6. And be it further enacted by the authority aforesaid, that this act shall be taken and allowed in all courts within this kingdom as a public act; and that all judges and justices shall take notice of it without special pleading; and that all sheriffs, bailiffs, and other officers and ministers of justice, concerned in the execution of process, are hereby required to have regard to this act,

as they will answer the contrary at their peril.

Adjudications upon the foregoing statutes.

Strange moved to discharge the defendant out of execution, as being an *ambassador's* servant, viz. his English secretary; and it was objected, that he did not lie in the house; and the words of 7 *Ann. cap. 12.* are domestic servant: *sed per curiam*, the nature of his employment requires his attendance at the house, and it is not necessary he should lie there; and the general words all writs and processes shall be void, take in this case; and therefore the execution must be set aside. 2 *Strange* 797. *Easf. 1 Geo. 2. B. R.*

4 *Geo. 2. Widmore v. Alvarez.* In the case of the French *ambassador*, it was ruled, that the person need not lie in the house, but he must do some actual service there.

Rule upon hearing counsel of both sides was made, to discharge the defendant out of execution, by virtue of the statute 7 *Ann. cap. 12.* it being made appear to the court, that he was a domestic servant of the envoy from the elector Palatine, viz. his secretary, and that all the steps prescribed by the act were pursued. May 25, 1728. *Lord Raym. 1524. Easf. 1 Geo. 2.*

The defendant was secretary to the resident from Venice, but yet was taken in execution; accordingly, upon affidavit from the resident that he was so, and that his name was entered in the Duke of Newcastle's office, though it was not transmitted over to the sheriff of Middlesex at the time he was arrested, but a few days after; and upon affidavit that he offered to shew his testimonials to the officer, and that he really exercised the office, the court discharged him, notice being given of the motion. *Barnardist. Rep. in B. R. Mich. 2 Geo. 2.*

On rule to shew cause, why the defendant should not be discharged out of custody, being a servant to an *ambassador*; Mr. Reeves said, that the words of the affidavit, upon which the rule was made, only were, that he was hired in quality of a domestic servant to the *ambassador*, and did what service he required of him; but he objected, that it was not sworn, that he actually served the *ambassador* in the capacity he was hired in; and besides he said, the defendant has stiled himself apothecary in the affidavit; and by an express clause in the act, which gives protection to *ambassador's* servants, no one is entitled to such protection, who is liable to an act of bankruptcy. The attorney-general, on the other side, said, that by the defendant's stiling himself apothecary, it does not appear that he was any thing more than a journeyman, and in such case he would not be liable to become bankrupt; and as to the other objection, he submitted it, that the affidavit was certain enough. But the court said, it was necessary that the defendant should have sworn, that he actually served in the capacity he was hired; and upon that discharged the rule. *Barnard. Rep. in B. R. 4 Geo. 2.*

The defendant was arrested, and held to special bail, and moved to be discharged on producing a certificate from the French *ambassador*, that he was his master of horse. It appeared that he was a trader, and such a one as a commission of bankruptcy might issue against, and so the court discharged the rule to shew cause. 2 *Vin. 289.*

Upon a motion to supersede a process against the defendant, upon the statute 7 *Ann.* as being in the service of a foreign *ambassador*, the court held, that to be a privileged servant within the act, it is not required that the party actually live in the *ambassador's* house; neither is it enough that the party be registered in the secretary's office as a servant; but when he comes for the benefit of the act, he must shew the nature of his service, that the court may judge, whether he be a domestic servant within the meaning of the act of parliament. In this case, it was objected against the defendant, that he was a trader, and so expressly excluded from privilege by the statute: to which Mr. Solicitor-general, who was counsel for the defendant, answered, that by traders within this act, must be understood, such as may have the benefit of the statutes concerning bankrupts, which infants are not entitled to, as it was determined in one *Whitlock's* case; and that the defendant could prove he had exercised no trade since his full age. *Fitzgib. Rep. 200.*

Defendant

Defendant said, that he was a menial servant to the Mecklenburg ambassador. It was held, that menial servants are not within the act, the words being domestic, or domestic servant, who are such as are employed in and about the household affairs only.

The defendant, a courier to the Spanish ambassador, moved to stay proceedings. The plaintiff alledged, the defendant was a trader. It was answered, the trade was so inconsiderable, that it could not amount to a bankruptcy. It was again replied, that a probable cause will make a bankrupt; and it was further alledged, that the defendant being no domestic, had no settled yearly wages; and that being registered in the sheriff's office was not material: so the court discharged the rule to stay proceedings. 2 Vin. 288. Mich. 10 Geo. 2.

A domestic of the duke of Holstein, resident here, was arrested, and thereupon gave a bail-bond; and it was moved upon this statute to set the same aside; all the terms required by the act being complied with, and thereupon the arrest was set aside, and the bail-bond vacated. 8 Vin. 288.

A servant to the Genoese ambassador brought a bill in Chancery. It was moved that he should not proceed, till he gave security by bond in 40 l. penalty for the payment of costs of suit if awarded against him, in the same manner as where a plaintiff is beyond-sea; and a precedent was cited where a like order was made in the case of an ambassador's servant plaintiff in this court, and dated 25 July, 8 Ann. and it was ordered accordingly. 2 Vin. 288.

When ambassadors come to settled courts, which do, and must observe essential forms of proceedings, they must be governed by them; and therefore in the case of Don Diego Serviento de Acuna, ambassador leiger from the king of Spain, who libelled in the admiralty court, as prosecutor-general for all his master's subjects, against one Jolliff and Tucker, and Sir Richard Bingley, for two ships, and their lading of divers kinds, of the goods of the subjects of the king of Spain generally, and not naming of them *adduct. ad port. de Munster*, in the preface of the libel generally against them all, and then proceeds and charges them severally thus: "That Jolliff and Tucker, captain *piratae*, in *alto mari bellice dictas naves aggressi sunt, & per vim & violentiam* took them, and that they were *adducti in partes Hiberniae*, and that, coming into the hands of Sir Richard Bingley, he converted them to his own use (not saying where) and, refusing to render them, being required, it was there held that a prohibition should go, for the matter is triable merely at the common law, and that such a procuration was not good, though to an ambassador.

Don Alfonso de Valesco, ambassador to the catholic king, attached tobaccoes at land here, which one Corvero, a subject to the king of Spain, brought hither, and the ambassador, by the libel, supposed to belong to his master, as goods confiscated, as all other his goods were. Sir John Watts, the plaintiff in the suggestion, prayed a prohibition, which was granted accordingly, for the property of goods here at land must be tried by the common law, however the property be guided. See ADMIRALTY; and it was likewise ruled, that if any subject of a foreign prince bring goods into this kingdom, though they were confiscated before, the property shall not be questioned but at the common law of England. Don Alfonso *vers. Corvero*, Mich. 9 Jac. Hob. 212. Hill. 9 Jac. upon the like libel by Don Pedro Surega, ambassador for Spain.

By the civil law, the moveable goods of an ambassador, which are accounted an accession to his person, cannot be seized on, neither as a pledge, nor for payment of a debt, nor by order or execution of judgment; nor by the king or state's leave where he resides (as some conceive) for all co-action ought to be far from an ambassador, as well that which toucheth his necessities as his person, that he may have full security; if therefore he hath contracted any debt, he is to be called upon kindly, and, if he refuses, then letters of request are to go to his master; *Grotius, lib. ii. cap. 18*; so that at last that course may be taken with him, as with debtors in another territory: to some this may seem hard, yet kings, who cannot be compelled, want not creditors. But the lord

Coke seems to be of another opinion, *Coke 4 Instit. fol. 153*. "Certain it is, that none dareth presume to meddle either with their persons, goods, or servants, without leave had, the contempt of which hath been punished with imprisonment; but as to contracts and debts that be good *jure gentium*, he must answer here."

AMBER, *Succinum*, a species of bitumen, of a yellow transparent colour, and a resinous taste.

Various have been the opinions of naturalists, with regard to the origin of amber; but the following observations from Hoffman put the matter beyond dispute.

The earth, that rich storehouse of nature, contains in its bowels, not only metals, minerals, stones, earths, and salts of various kinds, but also cherishes within its bosom bodies of a sulphureous, unctuous, and tenacious substance, which pass under the name of bitumens.

The nature of bitumens does not in the least belong to the common and mineral sulphur, for this will by no means be resolved into oil and spirit by distillation; but bitumens, distilled in a glass vessel, afford oil and spirit, besides an exhausted and sluggish earth. Even the vapour, as well as the smell, emitted by mineral sulphur, are manifestly unlike the exhalations from bituminous bodies.

The principal distinction of bitumens is into the noble and ignoble kinds, and both these are either dry or fluid. Within the class of the noble kind, are comprehended *ambergriſe*, and *succinum*, or amber.

As to amber in particular, it is produced plentifully in Prussia, which is famous for being the proper and native country of it. Though this bitumen is generated in the earth, there is plenty of it found in the Baltic sea, on the shore of Sudwic, where it swims on the water, and is taken up in nets. Nor even is this amber produced from the sea, but, in tempestuous agitations of the waters, is washed out of the bowels of the earth by the waves, and at last thrown towards the shores. Very probably then, may this bituminous body be reckoned in the class of minerals; for it is a product of the earth, and is contained within its proper veins, as well as pit-coal, or other minerals.

The courses of these veins were discovered some years ago, by order of the king of Prussia, in the following manner: in digging, they first met with sand, which being removed, the next thing that presented itself was a stratum of white clay; digging under this, they opened a ligneous stratum, that seemed to be compacted of wood. Under this stratum, in most places, they found ore of vitriol, which, when exposed to the open air, shot forth in flowers of vitriol, free from the least tincture of copper, and like those which proceed from the Hessian iron ore.

At last, digging still deeper, they came to a stratum of sand, which proved very fortunate; for out of this, in several places, with convenient instruments, they extracted abundance of choice amber. After the same manner they get it out of the sand in the marquise, near Kustrin; and in the territories of Stolpen and Dantzic, it is also found in lumps.

Hence appears the falsity of the old fable, which would have us believe, that amber is the resin of trees, which distils from their bark into the sea, and is there digested, by the heat of the sun, into a body of that kind.

The manner in which this bitumen is generated, seems to be this: from that bituminous fossil wood, which we just now mentioned, by the accession of the subterranean heat, there distils an oil resembling naphtha or petroleum, which, in penetrating the subterranean strata, passes through the vitriol ores, where, by mixing with its acid, it is coagulated into a substance of a resinous form. The reasonableness of this opinion will appear from the following considerations:

1. That amber at its first growth was liquid, may be proved from its being often seen conglobated by nature itself into a spherical form.
2. Sometimes insects of various kinds are included in pieces of amber, which they never could have been, if the matter, in which they are circumscribed, had not been liquid.
3. We may conclude that amber is a concretion of an oil, nearly resembling petroleum, because oil of amber comes near to petroleum,

leuni, both in smell and virtue, and both of them are equally difficult to be dissolved by the highest rectified spirit. 4. Charlton, a very sagacious observer of nature, in his treatise of fossils, affirms, that pieces of this bitumen have been frequently found, in which naphtha and petroleum have been included. 5. The acid salt of amber is of a very fixed nature, and not inferior in virtue to the acid of vitriol. What will afford great light in this affair is that physical experiment, in which it is observed, that all distilled oils, scarce one excepted, and amongst them aromatic oils, being mixed with oil of vitriol, or pretty strong *aqua fortis*, condense into a kind of resinous mass, which, held to the fire, readily bursts into flame. 7. Fossil wood and coals, by distillation and rectification, yield an oil, very much like oil of *amber* and petroleum. 8. Lastly, the very disposition of the strata, which we have related, is strong proof of this matter. The first of these is ligneous, the second vitriolic, and the last composed of sand, at the bottom of which lies the *amber*, scattered here and there in small pieces.

Amber is of various colours; the best is reckoned the pellucid, quite free from spots. Next to the pellucid is the white, after that the yellow, and lastly, the brown, is the worst of all.

The most eastern nations of Asia, and particularly the Japanese, give a higher price for *yellow amber* than for *ambergrease*, and value it even more than precious stones, of which, except coral, they make but little or no use. But, amongst all the several sorts of *amber*, the yellow transparent *amber*, which is so common, and so little valued among the inhabitants of Europe, is that for which the Japanese give the highest price, because of its perfection, and the antiquity they ascribe to it. They despise all other sorts of *amber*. This is what Kæmpfer acquaints us with.

Oil and volatile salt of AMBER. If *amber* be pulverized, and mixed with an equal quantity of sand, bole, &c. it will afford, by distillation, in a glass retort, an extraordinary quantity of oil. And if the fire be augmented to an intense degree, towards the end of the operation, a salt of an acid taste will be left in the neck of the retort, which being separated from the oil, and again sublimed, is what we commonly call the volatile salt of *amber*, though it be not of a remarkable volatile nature, since it cannot be raised but by a vehement fire.

Boerhaave says, that the oil, when rectified, has a sharp, balsamic, stimulating, diaphoretic, diuretic, emmenagogic, and anti-hysteric virtue, and when externally used, by way of liniment, is very serviceable in restoring contracted, weak, paralytic, torpid limbs. That the volatile salt is gratefully acid, balsamic, unctuous, penetrating, preservative, and stimulating to the nerves and spirits, being a true volatile, acid, oily salt, and therefore a capital anti-hysteric and diuretic, especially if purified by a second distillation.

Powers of AMBER. This is a tincture extracted with alcohol from oil of *amber* ground in a mortar with sal ammoniac, by digestion. It is supposed to have the same virtue as the oil.

Tincture of AMBER. There are several ways of extracting a tincture from *amber*. Boerhaave's method is to reduce the *amber* into a fine powder, and grind it in a glass mortar with oil of tartar *per deliquium*; then to dry it in a warm furnace, and let it dissolve in the open air for several times: after which the tincture is to be extracted by pure alcohol.

This medicine is of wonderful service in hypochondriacal, hysterical, languid, cold, watery cafes, and convulsions often proceeding from them.

Liquid AMBER, is a kind of resinous or natural balsam, which flows, by incision, from a tree common in the West-Indies. It is a fat liquid substance, of the consistence of Venice turpentine, yellow, inclining to red, of an acrimonious taste, aromatic, and fragrant.

It heats and moistens, resolves and opens obstructions, and is an emollient and ripener. Its principal use is in obstructions and hardnesses of the womb, in hard tumours, &c.

AMBERADA. Thus they call the false, or factitious *amber*, which the Europeans use in their trade with the negroes on the coast of Africa, and particularly on the

river Senegal. There are some large and red pieces of it, 1000 of which making twenty ropes, or strings, weigh three pounds. There are others small, and also red, which weigh but two pounds and a half.

AMBERGRISE, or AMBERGREASE, is a solid sebaceous substance, not ponderous, of an ash-colour, variegated like marble, and marked often with white specks.

There are two kinds of *ambergrise*, the ash-colour and black. The first is to be preferred, when cleared of all filth, with a strong smell, light, and which, being pricked with a hot needle, drops a fat odorous juice. The black is less esteemed, as being mixed with earth or mud, or adulterated.

The pieces of *ambergrise* are sometimes found so large, as to weigh above two hundred pounds. It is found in great quantities about the Molucca islands, in the Indian sea, and frequently on the shores both of Africa and the East-Indies. Pieces of it are also met with on the northern coasts of England, Scotland, Norway, and Ireland, being thrown ashore by the tide.

The origin of *ambergrise* is a point that has been long debated amongst physicians and naturalists, some maintaining it to be the product of the animal, others of the vegetable creation.

Some assert that it is the dung of some oriental bird; and, as a demonstrative proof of their opinion, shew the claws and fragments of the beaks of birds, that are often found inclosed within its substance; which, being committed to the fire, emit the odour of an empyreumatic volatile salt, which smell is almost peculiar to bodies which derive their origin from the animal kingdom.

Others, on the contrary, attempt, to prove, that *ambergrise* is a kind of honey, which is made by the bees in the rocks by the sea-side; and, being afterwards attenuated and digested by the heat of the sun, becomes a substance of that fragrance we find it.

But these errors may be soon detected by plain chemical experiments; for all dung of animals, and honey too, admit of a solution in aqueous menstrua; but obstinately resist the highest rectified spirit of wine.

Some of the moderns have thought it to be a peculiar kind of resin, or tear, distilled from some tree, as yet unknown to us, in the eastern parts of the world, and afterwards transferred to the sea, where, acquiring a more perfect digestion by the heat of the sun, and by the sea-salt, it constitutes a resinous body of that nature.

But, besides many other reasons, what directly thwarts and overthrows this opinion, is, that all resinous bodies of vegetables will admit of an easy solution and extraction in the high rectified and phlogistic spirit of wine; whereas the contrary is true of *ambergrise*, which is very difficult to be dissolved in such a spirit. Besides, it is observed that inflammable bodies, produced from the earth, as *amber*, bitumen Judaicum, and sea-coal, are also difficult of solution, and are by no means readily united with a very spirituous liquor.

In Number 385, and 387, of the *Philosophical Transactions*, *ambergrise* is said to be a true animal concrete, formed in balls in the body of the male spermaceti whale, and lodged in a large oval bag, just over the testicles, near the root of the penis. It is, however, added, that to one spermaceti whale, which has any *ambergrise*, there are two which have none. But this opinion is absolutely overthrown by that learned chemist, Mr. Neuman, who has shewn that *ambergrise*, by a chemical analysis, does not produce any one animal principle; and therefore, whenever it is found in whales, it must have been swallowed by them.

These things considered, the most reasonable opinion is, that it is a species of bitumen, and owes its origin to the earth, out of whose bowels it is torn, and washed away by the violence of the waves, and carried into the sea, about the island of Madagascar, where the subterraneous parts are believed to be pregnant with that kind of bitumen.

This drug is much used by confectioners and perfumers, in giving a fine smell to their preparations; and physicians recommend it as proper to raise the drooping spirits, and accelerate their motion.

As it is very difficult to make a solution of *ambergrise*, and on that account rarely to be met with in the shops, we

shall give the learned *Hoffman's* method of performing this operation: Let the spirit of roses, perfectly dephlegmated, be twice at least drawn off from salt of tartar, calcined in a vehement fire. By this means there is produced a spirit, which, by its penetrating quality, enters the inmost substance of the *ambergrise*, and so separates and resolves its oleous contexture.

This solution of *ambergrise* is deservedly placed at the head of strengthening remedies, and such as corroborate the debilitated system of the nerves, and, consequently, has the preference of all such medicines as are appropriated to distempers, which proceed from a decay of strength in the nervous parts. *Hoffman*.

They sell at Amsterdam two sorts of *amber*, namely *ambergrae* and *black amber*.

Ambregrae sells from eight to sixteen guilders per ounce. The discount for prompt payment is one per cent.

The price of *black amber* is from five to eight guilders per ounce, with the same discount, or deduction, for prompt payment.

AMBER-SEED. See ABEL MOSC.

AMBLE, in horsemanship, a peculiar kind of pace wherein a horse's two legs of the same side move from the ground at the same time.

Several different methods have been proposed for bringing a young horse to *amble*; but they are in general attended with such dangers as render them of little use. And indeed the best method is to try with the hand by a gentle and deliberate racking and thrusting of the horse forwards, by helping him with your snaffle, which must be smooth, big, and full, and correcting him first on one side, and then on the other, with the calves of your legs, and sometimes with a spur. If you can make him, of himself, strike into an *amble*, though shuffling and disorderly, a great deal of labour will be saved; for that aptness to *amble* will make him, with more ease and less danger, endure the trammel, and find the motion without stumbling or surprize; but if you perceive that he will, by no means, apprehend your intentions, struggle not with him, but immediately make use of the trammel; which is a device, sometimes made of leather, but usually of rope, fitted to the horse's legs, to regulate his motions.

AMBOINA. The isle of *amboina* is situated in four degrees twenty minutes from the equinoctial line, at forty-two leagues distance from the isle of Banda, or thirty-four from Poulo-Rhon, the westernmost of this cluster, and consequently the nearest. Some authors place it amongst the number of the great Moluccas, although it has not above twenty-four leagues circumference: it is divided in two, so that from the isthmus, which separates the two parts, being very narrow, it seems to form two isles. The largest of these two parts is called *Hiton*, and the other not above half as big on the southern side, *Leytimor*; the first is twelve leagues long, and two and a half broad; and the other five leagues in length, and one and a half in its greatest breadth. The small peninsulas of this island, form a narrow gulph between them, of a parallel length with *Leytimor*, and something better than a league wide; both at its entrance and in the middle. Besides this great isle of *Amboina*, there are ten small ones very near, viz. *Ceram*, *Ceram-Laut*, *Bouro*, *Amblau*, *Manipa*, *Kelang*, *Bonoa*, *Orna*, *Honimoa*, and *Noussa-Laut*; these three last bearing the name of *Uliassers*, which with *Amboina* are the only four isles where any cloves are cultivated, the trees in all the others being grubbed up, as these produce sufficient to serve the whole globe. The Dutch company have redoubts and settlements in all the islands, as well to restrain the inhabitants from planting, as to hinder any contraband trade from being carried on. At *Amboina* they have several forts, in one of which the governor resides; this being the fifth of the company's governments in India.

When the Dutch first became masters of this isle, there were very few clove-trees in it, but they have since made such plantations, that it now produces more than all the Moluccas put together. The greatest crops are gathered at *Hiton*, *Louhon*, *Campbelle*, *Lesside*, *Nan*, *Caylolo*, *Cabeau*, *Larike*, *Vaccasikou*, *Ourien*, and *Affaloulo*,

part in the small, and part in the great isles. All the isle is divided into several villages, and each village into many orchards equally cultivated by the Dutch and natives, who are each obliged to plant ten clove-trees yearly, which has been the occasion of so great a multiplication, as not to leave room for the culture of other fruits, pulse, and greens for common use; these being brought from abroad, especially Batavia. The clove-trees of *Amboina* and its neighbourhood have, from one year to another, a good and a bad crop, which is different from the other Moluccas, where the other good crop comes only every fourth year, and sometimes every seventh. They have tried to plant nutmeg-trees in the isle, and have some few growing in gardens, though they thrive very poorly. At *Victoria*, there are magazines always full of stuffs, ready made cloths, cotton cloths, and other merchandize of India and Europe, where the inhabitants go to furnish themselves with what they want, on which the company makes large gains. The provisions, stores, and commodities from Batavia, are brought here yearly by two of the company's vessels, which on their return load entirely with cloves, which some years are produced in such quantities, that they are obliged to burn, or throw part of them into the sea, proceeding from the obligation the Dutch have laid themselves under to take all that the season yields, at a price agreed on with the owners.

It is supposed that here are more than sixty-thousand inhabitants, of which the least part are Dutch; so that these are forced to maintain large garrisons to awe the natives, in case they should be dissatisfied at the reception of their cloves. And it may be seen at what an expence both of blood and money the company have secured to themselves this branch of business; and yet, after all their care and precaution, it never has, nor ever will be, in their power to hinder the extraction of the spices entirely, and in the manner they endeavour to guard against, with so much jealousy; I mean by partly falling into the hands of foreigners. The total number of the clove-trees growing in all the places before-mentioned, are supposed to be about two hundred and fifty-thousand, *extra* of the young plants rearing, to supply the old one's decay; and as their fecundity is uncertain, and greatly varying according to the different seasons, I here add the products of seven successive years, that the reader may thereby calculate the average, viz. in 1705, two thousand and six bahares of five hundred and fifty pounds; anno 1706, twenty-six hundred and sixty-one bahares; anno 1707, seventeen hundred and ninety-eight bahares; anno 1708, fifty-nine bahares; anno 1710, nine hundred and thirty-six bahares; and anno 1711, thirteen hundred bahares. The English in the beginning of the seventeenth century, in the reign of king James I. had here a factory in conjunction with the Dutch; but the Dutch forcibly expelled the English factors in time of peace, tortured and put to death several of them, invaded and usurped the dominion of the spice islands, which had submitted to the English, and have kept possession of them ever since, monopolizing the fine spices, and excluding all the rest of the world from them.

AMBULANT, is said at Amsterdam of those brokers, or exchange agents, who have not been sworn before the magistrates. They transact business like the others, but their testimony is not received in the courts of justice. See AGENTS of Exchange.

AMERICA. Among the discoveries mentioned in history, whether owing to accident or reflection, that of *America* is not the least advantageous. This quarter of the world was for many ages unknown to the Europeans. At length the happy æra arrived, when industry, spirited up by resolution, was to remove all the difficulties, exaggerated by ignorance. It is so called from *Americus Vesputio*, a Florentine by birth, who, in 1497, was sent to improve the discoveries made by *Columbus*. The prodigious magnitude of this continent, the multitude and extent of its provinces, the variety of its climates, products, and curious particulars; and lastly, the distance and difficulty of one part communicating with another, and especially with Europe, have been the cause, that *America*, though discovered and inhabited in its principal parts

SOUTH AMERICA

of the late 18th century,
as it was in 1790,
by the late Robert,
with Improvements.

Longitude 17° from London

Longitude 17° from London

parts by Europeans, is still but imperfectly known by them, in many things, which would greatly contribute to give a more perfect idea of so considerable a part of our globe. What has hitherto been discovered, reaches from latitude seventy-eight degrees north, to latitude fifty-six degrees south; that is, 134 degrees, which, taken in a straight line, amount to upwards of 8040 miles in length. With regard to breadth, it is very irregular, being in some places 3690 miles, and in others, not above sixty or seventy miles over. The boundaries ascribed to it, are the lands about the pole on the north; the Atlantic ocean, which separates it from Europe and Africa, on the east; another vast ocean, on the south; and the Pacific ocean, usually called the South-sea, which divides it from Asia on the west.

This vast country was not discovered till the year 1492, when the enterprising genius of Columbus drew aside the veil of ignorance, and shewed it to the surprized inhabitants of the old world. The honour, however, of this great discovery has been claimed by almost all the maritime nations of Europe. The Spaniards tell us, that Columbus received his lights from the papers of captain Aldres, their countryman, who had been cast on the coast; and the French say he had them from Betincourt, who first discovered the Azores. It would be a difficult matter to determine this contest; but it appears that our claim to the discovery of this new world is prior to that of the Spaniards, whose pretensions seem to be the best grounded: no one can dispute the authenticity of those vouchers, whereby it appears that Sebastian Cabot, a Venetian, a man no less enterprising, or less skilled in navigation, than Columbus himself, was sent by our Henry VII. a year before the discovery of Columbus; and, having first discovered Newfoundland, sailed along the coast as far as Florida. We must not omit, that the Welsh claim a more ancient discovery than any yet produced; asserting that prince Madoc, son of Owen Guineith, was cast on the coast of Florida as early as 1170, or 1190. Though indeed some look on this relation as fabulous, it has a great many corroborating circumstances, that make it appear not improbable; for Meredith ap Rheife, who gives us the account, was prior to Columbus, and died in the year 1477, which is fifteen years before Columbus began his expedition. To this we may add the affinity between the language of the Welch and of some of the settlements in those parts, which receives some weight from the evidence of Mr. Davis, who tells us he met with a whole settlement that spoke the Welch language in its utmost purity; and from the tradition of some of the inhabitants, who assert, that their ancestors came from a country beyond the great waters, nearly about the same time, from the same point of the compass, or from the rising of the sun.

This may seem, in some measure, to account for the *Esquimaux*, the only people in the vast continent of *America*, that differ from the rest of the original inhabitants. They live in the north part of *America*, in a country called *Labrador*, but whether they reside constantly there or not is uncertain. They make excursions as far as the sea-coasts of Newfoundland; and they have been seen near Nelson's river, that falls into the west-side of Hudson's bay. They deserve the name of savages better than any people yet known; for they eat raw flesh, and have a thick beard that covers their faces up to their eyes, inasmuch, that their features can hardly be perceived. Their hair is generally black and rugged; their eyes little and wild, and their whole external appearance frightful and ugly. Their character and their manners are quite agreeable to their hideous appearance; for they are wild, fierce, distrustful, and always ready to do mischief to strangers. Their stature is rather tall than otherwise, and they have a pretty good shape; but their large beards and plenty of hair, the whiteness of their skin; their always going cloathed, and their having no resemblance of their next neighbours, leave no room to doubt, that they proceed from a different stock from the rest of the Americans: still their language, having no resemblance, as it is thought, to any we know of, must make us seek a different original for them from the Welch; for it may be well presumed, that though the

Welsh dialect is uncommon and little known out of Wales, yet some of our seamen, or the Bretons among the French, by their intercourse with this people, must have discovered the analogy of their language long before now, if there was any.

However, it is very remarkable that all the native Americans are near alike, except the just-mentioned *Esquimaux*; for they have all coarse black hair; and are without beards, nor yet have they any hair on any part of their bodies: some have pretended, that old women have been employed to pluck the beards and other hair up by the roots; but this is known to be a fable, which is confirmed by all the later and more sensible travellers. Besides, it is well known, that when hair is plucked off it grows again; therefore it must be wonderful that no hair is ever seen, not even on the bodies of those that have been brought to England.

The Americans in all the European plantations are very well known, and yet it might be doubted, whether those in the southern parts of *America* are like the other inhabitants; especially as some seamen have represented those near the straits of Magellan as giants, that is, nine or ten feet high. However, we have been undeceived in this particular by Sir John Narborough, who informs us, that both men and women are of a middle stature, and well-proportioned, with roundish faces, and low foreheads. Their eyes are black, and their noses of a middle size; their teeth are very white and close-set; but their ears are small. Their hair is black, coarse, and shaggy, and both men and women wear it of the same length. They are full-breasted, and their complexion is of an olive tawny, or rather red. They grease their bodies, and their faces are dawbed with spots down their cheeks that are both white and black, without any method. They have small heads and short fingers; and they are active and nimble in all their motions; their cloaths are made up with pieces of skins of seals, guanacoes, and otters sewed together, and are in the form of carpets, about five feet square. They wrap them about their bodies as the Scots do their plaids; and they have also caps made of the skins of fowls, with the feathers on. Instead of shoes, they have pieces of skin tied on their feet. They are a very hardy people, and seldom wear their garments when they are stirring about; but were quite naked, from head to foot, when he saw them, which was at a time when the hills were covered with snow. They have no hair on their bodies or faces, nor any thing to cover their private parts; only some of the women had a piece of skin before them. The garments of both sexes are the same, except that the women had bracelets of shells about their necks. The men are of a larger size than the women, and their faces more full. The speech of the men is very harsh, and when they talk there is a rattling in their throat; but that of the women is shriller and lower. They live upon what they get, and are under no government; neither have they the least sign of religion. The men have always bows that are ready strung, which are about an ell long, and their arrows about eighteen inches long; these are headed at one end with flint; and at the other there are two feathers tied on with the twisted gut of a beast. They have very large dogs of several colours, besides which they have no domestic animal.

Mr. Bouguer, who went into South-America to measure a degree of the earth, says that the Americans of Peru, who live in woods, form a kind of little republic, under the direction of a Spanish priest, and have a governor with his officers, of their own nation. They want vivacity, and are addicted to idleness; but they live in great harmony with each other, without the least distrust. The doors of their huts are always open, though they have cotton, calabashes, and a sort of aloes of which they make thread, besides a few commodities they trade with. They go almost naked, and paint their bodies and faces with red stripes. They are of all trades; for they build their own houses, make their own canoes, and weave their own cloth. They live upon the fruits of the earth, hunting, and fishing, by which they always get sufficient to maintain their families. There are other Peruvians called warriors, who have not yet been brought under subjection; but they seem to have the same

same manners and customs. The colour of these Americans is that of red copper, which is more or less dark, in proportion to their being more or less exposed to the weather. They have no beard, nor hair on their breasts, nor any other part of their bodies; but have long, coarse, strait hair on their heads.

The *Californians* are the least known to the Europeans of any in this part of the world. Those of Puerto Seguro in that country, who were seen by the captains Rogers and Cook, had long black hair, and dark skins, made so by dawbing them with grease; for, according to some accounts, they would otherwise be reddish. The men go quite naked, only they wear, or tie round their heads, a piece of linen, or a kind of net-work. They wear about their necks, and sometimes on their hands by way of ornament, various figures in mother-of-pearl, intermixed with small round fruits like beads. Their weapons are bows and arrows, or javelins, which they carry always in their hands for hunting, or defending themselves against their enemies; for wars are frequent among them. The dress of the women is somewhat more modest than that of the men, for they wear from the waist to the knee, a sort of apron made with reeds plaited like mats. They cover their shoulders with skins of beasts, and have network on their heads like the men. They have also necklaces of mother of pearl, intermixed with stones or kernels of fruit and sea-shells, which hang down to their waist. They are a very lively people, and are fond of joking; but they do not seem to have any form of government, nor yet do they shew any sign of religion.

If we compare this description of the Americans with what is recorded of some late discoveries made by the Russians, in regard to the inhabitants of *Kamtshatka* and the neighbouring parts, we shall have good reason to believe that *America* was first peopled from the north-east of Asia; for, though it now seems to be certain, that there is an open sea between the two continents, yet it is towards the north so narrow, that it may be easily passed in the canoes or boats made use of by the people on both sides, especially the straits between the *Tchukotschinof*, or cape, and the continent of *America*; and if any credit can be given to the people who live upon that cape, there is an island that lies opposite to, and within sight of the cape, to which they may, in half a day, pass over in their boats; and from that island may be seen, in a clear day, a large continent to the eastward, which is full of people, who, in every particular, resemble the *Tchukotschi* themselves; but this continent, they say, is a much better country than their own, as it has large forests of fir, pine, larch, and cedar-trees, and great rivers running from the east, and falling into the sea upon the west side of it.

It is therefore highly probable, that, many ages since, some people have passed over from the north-east of Asia to the opposite coast of *America*, and finding that country more fruitful, and better provided with game of all sorts than their own, it is natural to suppose that they would settle there; for hunting and fishing were the only methods they had been accustomed to, and procuring themselves either food or raiment: even to this day, the people upon the north-east coast of Asia, never think of sowing or reaping; and the character of being provident no ways belongs to any of the natives we know of in *America*. The north-west coast of *America* having been thus provided with a few inhabitants, it is also natural to suppose, that their posterity would from thence, by degrees, spread to the southward, and at last over the whole continent of *America*. This conjecture is strongly confirmed by two very remarkable circumstances: we know, as above observed, that the natives of *America* have no beards: the case is the very same with regard to all the natives inhabiting the north-east continent of Asia. Another circumstance is the total ignorance of that destructive as well as useful metal called iron or steel. The natives of *America* had found out the method of refining gold and silver, and of making several little trinkets of those metals; but they knew nothing of iron and steel, when the Europeans first came among them, nor had they any weapons or instruments of that metal: the Russians tell us the same of the *Kamtshatdales*, and the neighbouring nations upon the north-east coast of Asia.

They might, perhaps, have seen some iron or steel arms, or instruments among the Japonese, who happened to be shipwrecked upon their coasts, but they knew nothing of the metal itself, until the Russians came amongst them; and for this reason, the arrows, spears, and other weapons, they made use of in their wars, were pointed only with sharp flints, or fish-bones.

These, we know, were the only sort of arms the Americans had, when the Spaniards first arrived in their country; and, as these two people resemble one another originally in their arms, so they likewise still resemble one another in their conduct in war. The north-eastern Asiatics carry on their wars more by stratagem than bravery, as they never will openly attack their enemies, unless forced to it by necessity; and the male prisoners they take, especially if they are men of consequence, are treated with all manner of barbarity, such as burning, hewing them to pieces, tearing their bowels out whilst alive, and hanging them up by their feet till they expire; but it is not said, that scalping has as yet been introduced among them, probably, because they are not yet generally provided with sharp knives: nor was this cruel custom introduced among the Americans, till the Europeans provided them with instruments proper for the purpose, and promised them a reward for every scalp; but with regard to their male prisoners, they are still equally cruel with those we may now call their ancestors of Asia, and carry on all their wars more by stratagem, ambuscade, or surprize, than by bravery.

With regard to the form of government among the people in the north-eastern parts of Asia, we are told, that before the Russian conquest, they lived in perfect freedom, having no chief, being subject to no law, nor paying any taxes; the old men, or those who were remarkable for their bravery, bearing the principal authority in their villages, though none had any right to command or inflict punishment; and they were so ignorant of numbers, that none could count above one hundred, very few above twenty, and even that, not without the help of their toes and fingers. Are not the people in most parts of *America* still in the very same situation, both with respect to government and numbers? But it would be endless to take notice of every correspondence that may be observed in the manners and condition of these two people; and if we consider that for so many ages, there has never been any intercourse between the ancestors in Asia and their posterity in *America*, we must be surprized to find that they still agree in so many particulars; especially, if at the same time, we consider the vast difference there is known to be between the climate and the fertility of the two countries, and the many ages that must have passed over, before a few stragglers from the northernmost parts of Asia could have filled the whole continent and islands of *America* so full of people, as they were found to be when the Spaniards first arrived there.

But that this could not require a great number of ages must be granted, if we suppose, that they had not for ages any wars among themselves, nor any intoxicating liquors; both of which are highly probable: they could have no wars, because they had room enough to extend themselves on all sides, without driving others out of the parts they were possessed of; and by the dark accounts we have of the empires of Mexico and Peru, it seems that they extended themselves faster, and in greater numbers towards the south, and along the eastern coasts of *America*, than they ever did towards the east of that continent; which is further proof, that the western coasts of *America* were the first that were peopled. Then, as to intoxicating liquors, even to this day, they know nothing of such liquors in those parts of *America* which have not had the misfortune to be visited by any Europeans, as seems probable from the account of Captain Bering's voyage from *Kamtshatka* to the western coast of *America*, for at Schumagin's islands, upon that coast, his people presented a glass of brandy to an Indian who came on board their boat, which he tasted, but immediately spit it out again, and was so much affronted, that he would not accept of any of the presents they offered him; which is a proof that they had never tasted any such liquors.

From all which, we have reason to conclude, that the natives of *America* were all, without exception, originally descended

descended from the people of the north-eastern coast of Asia; for even as to the *Eskimaux*, (if they were not of a Welsh original, as it is very probable they are not,) we know so little of them, that we cannot positively say, whether or no they had any beards, or any knowledge of iron, when we first began to visit that coast: if they had, it is probable they came originally from Norway, or Iceland, to Greenland, and from thence to *Labrador*, after the rest of *America* had been peopled, which prevented their spreading themselves to the southward; and this, consequently, is an argument for, rather than against, what has been said, with respect to the origin of the rest of the people of *America*.

In the variety of the climates of *America*, there must necessarily be a great variety of soil. The most northern and southern parts are rendered more barren by the excessive cold, but the rest is an immense treasury of nature, producing most of the plants, grains, fruits, trees, metals, minerals, &c. known in the other parts of the world, and those in great plenty; besides an infinite variety of others, peculiar to itself, as not having yet been found in any other country. But the chief wealth consists in the inexhaustible mines of gold and silver, which, though the labour and art of man have been continually endeavouring to drain for above 200 years, are yet so far from being impoverished, that they seem rather to want fresh supplies of hands to bring these subterraneous treasures to light.

Nor are gold and silver the only rich productions; there have been such great quantities of pearls, emeralds, amethysts, and other precious stones found here, and brought into Europe, that the value of those commodities is considerably diminished to what it was before.

To these may be added a vast number of other commodities, which, though of a lesser price, are still nevertheless very valuable and useful. Of this sort are cochineal, indigo, anatto, logwood, brazil, suttic, *lignum vitæ*, sugar, resin, ginger, pimento, cocoa, vanilloes, cotton, red wood, tobacco, turpentine, train-oil, naval-stores, furs of various sorts, hides, ambergrease, bezoar, balsam of Tolu, Peru, and Chili; jesuit's-bark, mechoacan, sassafras, sarsaparilla, cassia, tamarinds, and a wonderful variety of other drugs, woods, and plants; to some of which, before the discovery of *America*, we were either utter strangers, or forced to buy others at an extravagant rate from Asia.

The prodigious variety of excellent fruits which grow here, such as pomegranates, citrons, lemons, oranges, malicacious, cherries, pears, apples, figs, with all the culinary, medicinal, and other herbs, roots, &c. would be endless to enumerate. These are among the native productions of *America*; and its soil is so kindly and fruitful, that it nourishes many of an exotic growth in the greatest perfection; which is very remarkable in coffee, cultivated here of late with surprizing success. And though the Europeans, upon their first landing, found no corn; yet all sorts of grain are now produced, equal in quantity and goodness to any in the world. To which may be added sheep, hogs, oxen, goats, cows, &c. which have been transplanted from Europe, and have multiplied exceedingly.

Their seas abound with the greatest plenty and variety of fish, as do likewise their rivers, which are the largest and longest in the universe; and, in comparison whereof, those of Europe are no more than small brooks. The river of Canada, or St. Lawrence, in *North-America*, is known to run more than 1,500 miles, and is ninety miles over at the mouth. That of the Amazons in *South-America*, which rises in Peru, waters several large kingdoms in a course of 3,600 miles; and falling into the sea between Brazil and Guiana, rolls with such rapidity, and with such a prodigious quantity of water, that they take it quite fresh out of the sea, at several leagues distance from the mouth of it. That of Rio de la Plata is computed at least 150 miles in breadth at the place where it discharges itself into the ocean: besides a great number of others, not much inferior to these.

Upon the discovery of *America*, the Spaniards possessed themselves of the largest and richest part of it. Hence they derive immense treasures yearly, and the kingdom of Old Spain may even be said to depend wholly on the New for the support of her finances, and to owe all her opu-

lence and grandeur to her extensive colonies in these parts.

On the continent they have all *South-America*, except Brazil, on the western ocean, which belongs to the Portuguese, and except some parts either of Chili, or in the Magellanic land, on the isthmus of Darien, whose inhabitants they have not yet been able to bring under their subjection; and whom, on that account, they stile *Indios bravos*, brave or courageous Indians: except, likewise, the vast country of the Amazons, and almost the whole country of Guiana, where the French and Dutch have some settlements, but the Spaniards very few, if any.

The Spaniards have an immense wealth from *America*; yet other nations partake thereof, as we shall see presently; for the king of Spain has at least two millions sterling *per annum* revenues from thence, including the *indulto* on the goods brought back in return for the cargoes sent out by the other merchants of the several European powers who trade there, as well merchandize as money: the Spanish merchants have their commission for the returns, and have oftentimes the profits made in New Spain, paying the foreign merchants such a rate as they agree on for the goods at their going out; and this is very great, and enriches the merchants of Cadiz, Port St. Mary, Seville, and other places, to a very great degree.

The produce of the several countries in *Spanish-America*, are as follows: 1. Gold and silver in Mexico. See MEXICO. Silver and no gold in Peru. See PERU. Gold and no silver in Chili, and in the government of Veragua and New Granada. The quantities of gold and silver in all these parts of *Spanish-America*, are without measure, and without tale.

N. B. In the general accounts which we have of New Spain, travellers make mines of gold and silver in almost all the provinces of this great country: but we are assured that this is a mistake; the gold comes chiefly as above; there may be some gold found in the rivers, in the country about Carthagená, and St. Martha, but not in any other parts, that we have yet seen duly confirmed.

2. Sugar is another article, whereof there is an exceeding quantity, chiefly on the side of the bay of Mexico, Guaxaca, &c. But by the multitude of the inhabitants, and their luxurious way of living, the sugar is chiefly consumed in Mexico, and in the religious houses, in chocolate, sweet-meats, preserves, and confectionary wares. The quantity, however, sent from Guaxaca and Guatimala, and other provinces to Mexico, and to Panama, is exceeding great; so that it is a considerable branch of home-trade.

3. Tobacco. This is a very fine sort, though different from that of the Brazils; it is generally made all into snuff; of which the galleons bring great quantities. It is chiefly had at St. Martha, Carthagená, and that side of the gulph.

4. Cotton, which they manufacture at home, and drive a great home-trade in the goods made of it.

5. Indigo, esteemed the best in the world.

6. Cochineal, a very valuable merchandize, chiefly found in the government of Tobasco.

7. Valuable drugs of several sorts, as aloes, cortex peruvianus, or jesuit's-bark, Paraguay tea, sarsaparilla, balsams of divers kinds, and balm, some of Carthagená, the other of Tolu, brimstone, pimento, green stone for the gravel, cantharides, or Spanish flies, cassia, olcacasam, an antidote against poison, manna, amber liquid and solid, soap-root, myrrh, &c. &c.

8. Hides and skins, brought from Buenos Ayres, and the Havannah.

9. Chocolate.

10. Jewels, as torquoises, pearls, emeralds, coral, topaz, jasper.

The produce of these greatly extended dominions, with respect to trade, must be farther distinguished, as the several countries peculiarly distinguish them in their commerce. For here is a very considerable circulation of trade among themselves, as well as return to Europe; and perhaps more than in any other part of the world, out of Europe, China excepted. It is, therefore, necessary to distinguish between the produce of the country, which is sent to Europe as merchandize, and the produce carried from one part of *America* to another, for their home consumption. For example, wheat and barley are sent in great quantities

from Neoya, Guaxaca, Venezuela, Honduras, Coquimbo, Ifalcalla, and Chili, to Panama and Lima, and also from New Biscay to Mexico. The last town and country of Ifalcalla is called the granary of Mexico. Guatimala also has good wheat. Timber, pitch, and tar, hemp and cordage sent from Guiaquil for ship-building, to Panama, Lima, and Acapulco. Most of the great galleons for the South-Sea trade are built at Guiaquil, where they have naval-stores; also at Chiapa, Tabasco, Trinidad. Cotton spun and woven into several sorts of manufactures, in Jucuman, Niguaragua. Cotton unwoven, and for others to work into manufactures, but more generally wrought among themselves, at Vera Paz, Crudad Real, Guaxaca, and Mexico.

They have black cattle at New Granada and Carthage, Venezuela, Jucuman, Coquimbo, which three latter places supply the coast of the South-Sea. Nicaragua, Campeachy, and Guaxaca, send great numbers of black cattle to Mexico. Chiapa, La Plata, have the best horses and mules. Nicaragua, Chili and Chiopa, have sheep, which carry burdens, and travel all over Chili and Peru. The sheep carry the silver from Potosi to the sea-side.

They have a very great consumption of tobacco made into snuff among themselves; and it employs many ships to carry it from one place to another. The largest quantities of it are brought from the Havannah, on the isle of Cuba, which is carried to La Vera Cruz and Porto Bello; and sold to the merchants of Mexico at the first, and of Peru at the other. At Venezuela is the finest tobacco in all New Spain.

Cocoa is also a very great article in their merchandize; it is produced chiefly at Guatimala, Vera Paz, Soconufca, Crudad Real, and Guaxaca. The nuns have the chief trade of making it into chocolate: it is thought they drink more chocolate in the city of Mexico, than in all New Spain. Sugar is a general product in all the Spanish colonies in *North-America*, at Mexico, Nicaragua, Guaxaca, Crudad Real, Guatimala, Ifalcalla, &c. It is consumed in great quantities in Mexico, and the most populous cities; and large quantities are carried to Panama, from whence they carry it by sea to Lima, to Guiaquil in Peru, and to Baldivia in the remotest parts of Chili. This is a considerable article of their home trade, as before noticed.

They have some manufactures among them too; for the people spin cotton with great application, and they make abundance of necessary things of it, which they could not have from Europe but at an extraordinary price; as particularly they make a coarse stuff for the poorer sort of people, called *mestizos*, with which they clothe themselves, and of which they make hammocks to lie in.

They make also a kind of Segovia cloth, of sheep's wool, and cotton-wool, mixed together; and this is carried through the country on mules to be sold, like as the pedlars in Poland carry linen from place to place. This cloth is generally bought to clothe the free Christian Indians, who live in great numbers in the villages, and even in the largest cities, and drive trades according as they are brought up and taught when they are young; particularly, they are carpenters, masons, husbandmen, vine-dressers, planters, &c. Some of these have great farms, and are well turned for making of sugar and indigo. There are above 120,000 families of them in the city of Nicaragua, and the country adjacent, generally employed in feeding black cattle, and planting corn; with both which they supply the greatest cities toward Ifalcalla and Mexico.

The several kingdoms of this country are so vastly large, that great numbers of people, and of cattle, are employed to carry by land the growth of one country to another. The people of Nicaragua, and of the Honduras, employ 30,000 mules and horses to carry corn, sugar, cocoa, and other goods into the inward provinces; they carry those things, as provisions, even to Mexico itself.

Every time the galleons arrive from Europe, there are an infinite number of people of all sorts, as well Peruvians and Chilians as Spaniards, who come from the remotest parts of the Spanish countries to Porto-Bello, with servants, mules, guanicoes and other carriage, to trade for those European goods; and for the payment, they bring in the first place the bullion, which, as it is heavy, and must come at least over land from Panama, so it requires

abundance of cattle for carriage; others bring it by land-carriage from the countries whence they come, as from Cusco and Quito in Peru, over the mountains; and more still from Lima, and some come even from Chili itself, which is a strange journey for length.

The latter of these, it is true, bring nothing but gold, and generally come from Baldivia and St. Jago by sea to Lima, and the rest by land: but then these convey the European goods, which are bulky rather than heavy, up the river to the lake of Nicaragua, and so to Panama.

As there is a vast flux of trade thus between Porto-Bello and Panama on this occasion, so there is a very great trade from all the coast of Chili and Peru directly to Panama by sea; inasmuch, that on these occasions, there shall be seen in the bay and road of Panama, three or four hundred sail of ships at a time, against the approach of the fair at Porto-Bello.

In like manner, for carrying the treasure for the galleons, from Mexico, and the country of Paetneca, which is about sixty miles north from Mexico, to La Vera Cruz, when the galleons come from Old Spain, the number of carriages, men, and horses, are incredible. The silver mines in and about that part of the empire of Mexico, are hard to be reported; for the account would be looked on as fabulous and impossible.

The number of slaves, Indians and natives, employed in these mines, is proportionably great, besides above 10,000 Spanish Indians, and Creolian Indians or *Mestizos*, that is to say, begotten between a Spaniard and a Mexican; and besides 7 or 8000 families of real Spaniards, who live among, rule, and govern the rest. Add to these, the numbers of people, horses and mules, employed to carry all the treasure and merchandize between Mexico and La Vera Cruz.

The product of the country there is not sufficient to supply these, and the city of Mexico cannot supply them; therefore corn and cattle, and other provisions, are brought a long way for their support.

The carriage back again to other parts from La Vera Cruz, of the European goods which come by the galleons, is a very considerable article of trade; and particularly the carriage also of tobacco, sugar, and other produce of Guatimala, and the adjacent country of Guaxaca, which comes by sea to La Vera Cruz from the south-coast. All this is said to employ above 60,000 horses, mules, asses, and a proportioned number of men.

Cochineal is brought thus over the mountains from the country of Guadalaxara, north-west from Mexico about three hundred and twenty miles. It is brought on horses and mules, with which the country abounds.

This account of the inland trade and land carriage of New Spain, being so considerable an article of commerce, naturally brings us to speak of the trade of Acapulco on the South-Seas, as it respects the land part chiefly: but for this see the article ACAPULCO.

In order to comprehend the whole of the trade of *Spanish America*, we should take some notice of the supplies of all the goods they call for from Europe: for this we refer to SPAIN and SPANISH AMERICA for a more particular account.

We shall, however, here give a sketch of the great value of the returns made to Europe for this trade, from whence some calculation may be made by it of the value also of the goods exported from Europe. That some rational conjecture may be made of the magnitude of this whole trade in general, and the wealth of the Spanish dominions in America, in particular, we shall here exhibit the draught of a cargo of one of the least fleets or floats from La Vera Cruz, that came some years ago, and which consisted but of the galleons, and a *pelache*, or advice-boat; that arrived at Cadiz in July, 1723. It is as follows:

Pieces of eight	705,626 for the king	} duly registered.
Ditto	7,621,586 for the merch.	
Old plate	174,348	} also register.
Gold	403,277 in pistoles coined	
Ditto	15,325 in dust	
	8,920,162	

N. B. This is all what they call registered plate ; the plate unregistered is sometimes equal to it, and always very considerable.

Merchandize by the same fleet.

Cochineal	1,425 bales	Coral	8 chests
Indigo	1,931 ditto	Oil of myrrh	6 flasks lar.
Cocoa	920,000 lb. wt.	Ointment ditto	57 ditto
Vanelloes	70,000 lb. wt.	Powd. of oxaca	22 ditto
Jallap	458 bales	Prefents	263 chests
Cortex Peru.	67 ditto	Chocolate	114 chests
Lapis Contrayerva	37 ditto	China ware	18 ditto
Sarfaparilla	37 ditto	Liquid amber	11 boxes
Pearls	2 boxes	Bees-wax	8,716 quintals
Emeralds	1 ditto	Dress'd hides	1,527
Ginger	27 casks		

After the arrival of the above flota, came in the same season two ships from Buenos Ayres.

C A R G O.

Pieces of eight	498,326	for the king.
Ditto	2,753,842	for the merchants.
Gold	326,790	in dust for the king.
Hides	37,726	dried.
Paraguay tea	463	chests.
Cortex Peru.	237	bags.
Amber	38	boxes.

Another flota, which arrived in Spain in April 1727, being the same which, at that time, lay long blocked up at the Havannah, for fear of a war with England, consisted of seven galleons and four merchant-ships, exclusive of one ship lost upon the Azores or Westward Islands: this fleet was exceeding rich, and brought, besides private sums unregistered, and besides merchandize,

14,316,794 pieces of eight in silver.
123,840 in gold.

The ship lost had two boxes of coined gold, and 236,178 pieces of eight in silver. The merchants goods we had no estimate of.

At the same time, the galleons blocked up in the harbour of Porto-Bello, by Admiral Hosier, had on board no less than twenty-six millions of pieces of eight in specie, besides merchandize: at the same time also, an English ship called the Royal George, laden there, for the South-Sea company of London, had on board near a million of pieces of eight in treasure, besides merchandize; and another South-Sea ship at La Vera Cruz had near as much.

These are sure testimonies of the immense wealth of *Spanish America*, and of the great extent of the commerce from Europe thereto, of which the above were the returns.

After this, no question need be asked, to what a height such commerce may not be carried. It has advanced not considerably since; for though the trade of particular European nations may have declined, yet others have advanced, which has been, and always will be owing to the encouragement given to trade in Old Spain.

The islands in *America* belonging to the Spaniards are *St. Domingo*, otherwise called *Hispaniola*, which the French share with them at present; *Cuba*, *Porto Rico*, *St. Margaret*, and some other less considerable, which the Spaniards visit sometimes, but where they have no colonies. See SPAIN, *Spanish America*, ACAPULCO, MEXICO, PERU.

Before the last definitive treaty of 1763, France had on the continent of *America*, *Canada*, where are *Quebec*, *Montreal*, *Port-Royal*, *Richieu*, and *Frontenac*, the *Mississippi*, and *Louisiana*: but since the said treaty, these are annexed to the crown of England, and the privilege of navigating on the *Mississippi* is allowed to England as well as France.

Before the war, France had the islands of *Martinico*, *Guadeloupe*, *Desirada*, *Marigalante*, *St. Bartholomew*, *Granada*, and the *Granadines*, and they pretended a right to *St. Vincent*, *St. Lucia*, *Dominica*, and *Tobago*; but since

the said treaty, *Granada*, and the *Granadines*, *St. Vincent*, *Dominica*, and *Tobago*, are annexed to the crown of England, and *St. Lucia* is given to France, and the former are their ancient islands, of which we dispossessed them in the last war, and restored to them at the last peace.

Before the treaty of 1763, the French possessed the southern part of *St. Domingo*, *Cape-Breton* or *Louisburgh*, the island of *St. John's*, the island of *Anticofle*, the *Madeline* islands, and others dependant on *Canada*. Since the last peace, the French retain their part of *St. Domingo*; but *Cape-Breton*, the island of *St. John*, the island of *Anticofle*, together with the island of *Madalene*, and all dependencies on *Canada*, are ceded to Great-Britain; and the French have the islands of *St. Peter* and *Miquelon* ceded to them for the shelter of their fishermen, without the liberty of making any fortifications; and it is stipulated, that they are to keep a guard of fifty men only upon them for the police.

The Portuguese have in *America* the coast of *Brazil* only, which extends from the river of the *Amazons* to that of *St. Gabriel*, near the river *Plate*. That coast is divided into fourteen captainships or governments, of which those that are best known in Europe are *Fernambuco*, or *Pernambuco*, *Santos*, or *Baya da todos los Santos*, i. e. the Bay of all Saints, and *Rio Janeiro*. The rich gold and diamond mines of this country afford the Portuguese a constant supply of wealth; and the trade they carry on thither is the support of their kingdom.

The Dutch, who have so large a share in the East-Indies, have but a very small one in those of the West. Their islands are *Saba*, *St. Eustatia*, and a part of the isle of *St. Martin*; all these are the smallest and most inconsiderable of the *Antilles*. But, to make the Dutch some amends, they are in possession of *Bonaires*, *Aruba* or *Oruba*, *Curassou*, which is also spelt *Curacao*. These not lying at any great distance from *Carthagen*a and *Porto-Bello*, afford the Dutch frequent opportunity to carry on a very profitable contraband trade, which the Spanish governors are used to wink at.

They have also *Surinam*, at the mouth of the river of the same name, on the coast of *Guiana*; besides *Banron*, *Aperuace*, and *Berbice*; all these are on the continent, and are, as it were, separated by *Cayenne*, which belongs to the French.

The Danes are settled on the small island of *St. Thomas*, where the Hamburgers also have a small factory. This island is not far from *Porto-Rico*. They are also now in possession of *Santa Cruz*, and of one of the small islands called the *Virgins*.

The duke of Courland, with his people formerly, as well as the Swedes, made some attempts to get a footing in this new world; the former in some of the *Antilles*, and the latter in *North-America*. But their projects met with no success.

The same may be observed of the Scots, who, in the beginning of the seventeenth century, settled in the isthmus, and on the river of *Darien*, from whence they were driven by the Spaniards.

By this Survey of *America*, and of the territories belonging to the several European potentates, who share this part of the world among them in colonies, a good judgment may be made how greatly the general traffic and navigation of Europe depends on *America*. And, indeed, it is worth observation, that the trade from the several mother kingdoms interested in *America*, to their respective colonies there, may be looked on in the light of their own branches of foreign trade, as being under their own direction and regulation: and it must be allowed, that experience hath hitherto shewn, that those powers who most wisely cherish their plantation-trade and navigation in *America*, in due subserviency to the prosperity of their particular mother-countries, are likely to have the greatest share of mercantile shipping, the best nursery for seamen, and, in a word, to be the best capable of maintaining the dominion and sovereignty of the seas.

America, more especially its islands, depend greatly on Africa, which supplies the several powers therein concerned with negroes, to do their slavery in their respective plantations. To the Spaniards and Portuguese, the Blacks are particularly useful in their gold and silver, and diamond

diamond mines; to the English and the French in the production of their sugars, tobacco, rice, indigo, &c. &c. And in their islands particularly, it has been said that the Europeans cannot sustain that labour and fatigue in those climates equal to what the negroes are experienced to do. This, however, has been looked on by many wise and good men, as a pretext to subject that race of men to slavery; for, if the Europeans were obliged to live as soberly as the negroes, they would be as able to undergo the real slavery the negroes do in some plantations, especially in the French sugar-colonies, where in order to raise their colonies as suddenly as possible, they regard no hardships they put on their negro slaves: and by these means that rival nation first supplanted England in the sugar-trade of most parts of Europe.

The communication between *America* and *Asia*, though far from being so large as the circumstances of each will admit of, has, however, of late years, been carried to a pretty considerable extent, and is productive of mutual advantages to both. The commerce of the Philippine islands depends, in a great measure, on the two large ships which arrive thither yearly from *Acapulco*, bringing to the value of 10,000,000 of pieces of eight, in goods and specie; and the returns they make in all the choice products of the East-Indies, are dispersed from *Acapulco*, some in smaller vessels to the sea-coasts of *Peru* and *Chili*; but the greater part to *Mexico*, by land-carriage, which is 240 miles; whereby a great number of people, horses, mules, and carriages are employed. Add to this, that the exports from *America* to the *Philippines* come chiefly from *Mexico* to *Acapulco*, by the same land-carriage. See ACAPULCO.

For the trade of *America*, as the same relates to the interest of the powers under whose dominion the several colonies are, together with the peculiar laws and regulations made to render them more beneficial to those several powers; see *British AMERICA*, *Spanish AMERICA*, *French AMERICA*, *Portuguese AMERICA*, *Dutch AMERICA*.

AMETHYST, in *natural history*, is a gem, or precious stone, of a beautiful colour, being a mixture of blue and red, which form different degrees of purple.

Sometimes this gem is found without any colour, and whether naturally so, or divested of its colour by fire, it is scarce to be distinguished from a diamond, except by its degree of hardness. This stone is found of various sizes, from that of a small vetch, to that of an inch and a half in diameter; its forms are likewise different, being sometimes roundish, sometimes shaped like a pear, but most commonly hexangular, and pointed like crystals.

Amethysts are not only common in Italy, but also the Pyrenean mountains, and those of Auvergne in France, afford very good ones; and some of the finest sort are dug out of a mountain near Vic in Catalonia, where they are lodged among a reddish earth in the perpendicular fissures of the rock.

The oriental *amethysts* are generally reckoned the best; but some of these found in Silesia and Bohemia, as well as in other parts of Europe, are little inferior to those imported from the Indies, either in hardness or beauty.

Some have pretended that the *amethyst* worn on the finger, or drank in powder, prevents drunkenness; but this virtue, like many more ascribed to gems, is only imaginary.

AMIALE, or AMICABLE NUMBERS, are those which are equal to the sum of each other's aliquot parts.

Thus the number 284, and 220, are *amicable numbers*; for all the aliquot parts 1, 2, 4, 5, 10, 11, 20, 22, 44, 55, 110, 220, are equal to all the aliquot parts 1, 2, 4, 71, 142, of the number 284. Van Schooten has shewn a method of finding these numbers by common algebra, which the reader may see in *sect. II. Miscellan.* at the end of his *Exercitationes Geometricæ*. It is easy to apprehend from the nature of these numbers, that there are but very few of them, at least, that are manageable by us; for 284, and 220, are the two least, and, the two next greater are 18,416, and 17296.

AMIANUS, or AMIANTHUS, in *natural history*, is a kind of fossil stone, or mineral substance, of a whitish colour, and woolly texture, consisting of small filaments,

and endued with the wonderful property of resisting fire, and remaining unconsumed in the intensest heat.

This lanuginous mineral is not only found in several parts of Italy, and the neighbouring isles; but also in India, Tartary, Siberia, Egypt, Greece, France, the Netherlands, the isle of Anglesey, in Wales, Scotland, and many other parts of the world. It is sometimes called in English *earth-flax*, and *salamander's wool*.

Naturalists commonly reckon it among stones, but it seems rather a terra lapidosa, or middle substance between a stone and an earth. But, whether the one or the other, it is composed of a mixture of some kind of salt, and a pure earth without sulphur, coagulated in the winter, and brought to perfection by the heats in summer; which salt Johannes Hefus proves to be *alumen liquidum*, describing it, as Matthiolus also does, to be of a whitish lacteous substance, somewhat inclining to yellow, that sweats out of the earth, and smells like rotten cheese; whereof having gathered a quantity at Puteoli, together with the other species of allum, and, after keeping it a while by him, he found, that it had lost its smell, and a great part of it changed into *alumen plumbeum*, the saline part, probably, shooting into threads, and the pure earth uniting with them, as found in the places wherever generated.

The industry of mankind has discovered a method of working this fibrous mineral, and employing it in divers manufactures, chiefly cloth and paper; though one could scarcely imagine the thing practicable, without being mixed with some other plant matter, as wool, hemp, or flax, the filaments of the *amiantus* appearing too brittle for such uses. The cloth made with this incombustible matter was in great esteem among the ancients, and better known, and more common than at present. Pliny says, he himself had seen napkins of it, which, being taken foul from the table, and thrown into the fire, were by that means rendered as clean as if washed in water. But the principal use of it, according to the same author, was to make shrouds to wrap up the corpse of kings, &c. in order to preserve their ashes distinct from those of the fuel, which composed the funeral pile; and it is said the Tartars still use it in burning their dead.

With regard to the methods of managing the *amiantus*, and of spinning and weaving it, &c. the accounts are various. Sig. Castagnata, superintendent of some mines in Italy, found in one of them a great quantity of this lanuginous mineral, and discovered a way of preparing it in such a manner, as to resemble a fine lamb-skin dressed white; and he could thicken or thin it to what degree he pleased, so as to become either like a very white skin, or very white paper; both which would resist the most violent fire, as he often experienced.

Sig. Ciampini gives us the method of spinning the *amiantus*, and making it into cloth, which is as follows: he first laid the stone to soak for some time in warm water, and then opened and divided it with his hands, in order to separate the earthy parts, which are whitish like chalk, and serve to bind the fibrous parts together. This operation he repeated six or seven times with fresh water, still opening and squeezing the mineral, till all the heterogeneous particles were washed out, and then the flax-like parts were laid in a sieve to dry. One method of spinning the *amiantus*, thus cleansed, is to card it gently, and place it between the cards, in such a manner, that some of it may hang out at the sides. Then, having fastened the cards on a table or bench, take a small reel made with a little hook at the end, and a part by which it may be easily turned round. This reel is to be wound over with white thread, and a small vessel full of oil must be in readiness, with which the fore-finger and thumb are constantly to be kept moist, both to preserve the skin, and to render the filaments of the stone more soft and pliant; and so, by twisting about the thread upon the reel with the *amiantus* hanging out of the cards, some of the latter will be worked up with it; and this thread may, with care, be woven into a sort of coarse cloth, which being put into the fire, the thread and oil will be consumed, and the incombustible cloth remain. But, this method being very tedious, instead of the thread, it is better to put some flax on a distaff, and by taking three

three or four filaments of the stone, and mixing them with the flax, they may be easily twisted together, and the thread thus made will be more strong and durable; so that carding is unnecessary, and rather breaks the filaments than does any service. In washing the stone, the same gentleman observes, there will remain several short pieces at the bottom of the water, of which paper may be made by the common method. He adds, that the best way to preserve the cloth, or any thing made with this mineral, which, by reason of its dryness, is very apt to break and waste, is to keep it well oiled; when the cloth is put into fire, the oil burns off, and the cloth comes out white and purified.

It is a common opinion, that *amiantus* loses nothing of its weight in the fire; and this seems to be confirmed by what Sig. Ciampini tells us, that he kept it for three weeks in a glass-house fire, and found it unaltered. However, in two trials made before the Royal Society, a piece of cloth made of this stone, a foot long, and half a foot broad, lost each time above a dram of its weight. It is remarkable, that when taken red-hot from the fire, and laid on a piece of white paper, it did not burn it. M. Vilette says, that his burning-glass vitrifies the *amiantus*.

The proprietor of a forge in some part of France, upon taking down his furnaces to repair them, found a great quantity of this substance at the bottom, which, like the *native amiantus*, was capable of being manufactured either into incombustible linen or paper. Upon a farther enquiry, he discovered that both this and the *native asbestos*, is nothing more than calcined iron, deprived of the *phlogistic*, and that uniting the *phlogistic* with this, or the *fossil amiantus*, he can restore it any time to its primitive state of iron.

Does not this, says Mr. Needham, with the discovery of lava, pumice-stones, iron in a perfect state, and many other traces of fire observed in most of the mountains, particularly in all the great chains, and remarkably in all those under the equator, which are the highest on the globe, seem to indicate, that the dry land, with all its eminencies, was originally raised out of the waters by the force of subterraneous fire?

AMMI, in botany, the name of a plant, of which there are two sorts, the ancient and the modern. The ancient is thus distinguished:

Anmi verum offic. Ammi Creticum, Ger. 881. Park. Theat. 912. *Anmi alterum semine apii*, C. B. Pin. 159. Raii Hist. l. 455. True bishop's weed.

It is brought from Alexandria in Egypt. The seeds are small, striated, less than those of parsley, of a yellow inclining to red, of an acrid, aromatic taste, and a fragrant smell. It is seldom or ever found in our shops. It is incisive, aperient, and a drier; is effectual in pains of the colon and uterus, inflation of the stomach, and obstruction of the urine and menses. Dale.

Lemery says, that the seeds afford a great deal of essential oil, and volatile salt.

The modern is thus distinguished:

The lower leaves are winged, spear-shaped, and fawed on the edges, and the upper leaves divided into many narrow segments. This plant is annual; and, if the seeds are sown in autumn, the plants will flower by the beginning of July, and the seeds will ripen the beginning of September, or sooner, in a warm season. Formerly the seeds of the *ammi verum* and *ammi creticum* were brought from the Levant; but of late years there have been none of these seeds imported; but the seeds of the common fort have been used to supply their place. Miller.

AMMONIACUM *gummi*, the gum called *ammoniacum*, is a concrete juice, between a resin and a gum, brought from the East-Indies, usually in large masses, composed of little lumps or tears, of a milky colour, but soon changing, upon being exposed to the air, of a yellowish hue. The better sorts of this juice very much resemble, in appearance, the finer kinds of *benzoin*. It has a nauseous sweet taste, followed with a bitter one; and a peculiar smell, somewhat like that of *galbanum*, but more grateful, or according to Pomet, Hist. des drogues (nouvelle edit. par Pomet le fils) tom. II. p. 30. like

that of *opopanax*. It softens in the mouth, and grows of a whiter colour upon being chewed. Thrown upon live coals, it burns away in flame. It is in some measure soluble in water and in vinegar, with which it assumes the appearance of milk. For internal use, such tears as are large, dry, free from little stones, seeds, or other impurities, are to be chosen. The coarser kind of *ammoniacum* is purified by solution and colature, and then carefully inspissating it; but unless this be artfully managed, the gum will lose a considerable deal of its essential oil. The strained gum of the shops is a grievous abuse, being a composition of ingredients much inferior in virtue and price. The genuine *gum ammoniac* is, according to Geoffroy, Mater. Med. tom. II. p. 603, the juice of an umbelliferous plant growing in Africa, which flows from wounds made in it for that purpose: his conjectures are founded on the leaves and seeds, usually found among the tears.

This gum is opening, attenuating, and cleansing, good to clear the lungs of a viscid phlegm, and therefore of great service in asthma and shortness of breath; as also in nervous, hysterical, and hypochondriac disorders; outwardly applied, it is suppurating, ripening, and dissolving, and good for hard swellings and scrophulous tumours.

AMMONIACUM, or *Sal AMMONIAC*, a saline concrete, of which there are two kinds, natural and artificial.

The natural *sal ammoniac*, used by the ancients, was found in the sands of Lybia, near the temple of *Jupiter Ammon*, from whence it derives its name. It was supposed to be generated in these sands from the urine of camels. Nor will this appear strange, if we suppose that these sands are naturally impregnated with common salt; for then the urine of these animals, by the intense heat of the sun, must cause a fermentation, which will unite the acid of the common salt with the urinous salt, and consequently produce *sal ammoniac*.

M. Lemery had a salt taken from mount *Vesuvius*, which they call natural *sal ammoniac*. It was of a compact substance, pretty ponderous, very white, and the inside crystalline; it would not attract much humidity from the air, had no smell, was of an acid saline taste, and very much like that of *sal ammoniac*. He made several experiments with it; among the rest he mixed it with three times as much spirit of nitre, and made an *aqua regia* of it, exactly like what is made of the common *sal ammoniac*. He found it to have several effects of *sal ammoniac*, and also of sea salt. He supposes that this salt of *Vesuvius* is no other than a fossil salt, which is dissolved by the sea, and sublimed to the top of the mountain by subterraneous fires. Hist. de l'Acad. Roy. des Scien. 1705.

The artificial, or common *sal ammoniac*, is chiefly brought from Egypt; and, though there is hardly a more common drug, it is but very lately we have known in what manner it is made.

Method of making *sal ammoniac* in Egypt, as communicated to doctor Linnæus, by his pupil, doctor Hasselquist, who had been lately in these parts.

Sal ammoniac is made from the foot arising from the burnt dung of four footed animals, that feed only on vegetables.

This dung is collected in the four first months of the year, when all their cattle, such as oxen, cows, buffaloes, camels, sheep, goats, horses and asses, feed on fresh spring grass, which, in Egypt, is a kind of trefoil, or clover: for when they are obliged to feed their cattle on hay, and their camels on bruised date kernels, their excrements are not fit for this purpose; but when they feed on grass, the poor people of Egypt are very careful to collect the dung quite fresh, and, for that purpose, follow the cattle all day long, in order to collect it as it falls from them; and, if it is too moist, they mix it with chaff, stubble, short straw, or dust, and make it up in the form of cakes, about the same size and shape as it lies on the ground.

Then they fix it to a wall to dry, till it is fit to be burnt.

For want of wood, which none but the rich in Egypt can afford to buy, they burn this dung through the whole country, and sell a vast quantity of it to the salt-makers.

The excrements of the camel are not found at all preferable to any other; and its urine is never used for this purpose, although generally reported so by authors.

The salt-workers pretend, that human excrements, and those of goats and sheep, are preferable to any other.

The months of March and April is the only time they make the salt.

Sal ammoniac is made in the following manner:

They build an oblong oven, about as long again as broad, of brick and moist dung, of such a size, that the outside, or flat part of the top of the arch, may hold fifty glass vessels, ten in length, and five in breadth, each vessel having a cavity left for it in the brick-work of the arch.

These glass-vessels are globular, with a neck an inch long, and two inches wide.

These vessels are of different sizes, in different salt-works, containing from a gallon to two gallons; but in general are about eighteen inches in diameter.

They coat each vessel over with a fine clay (which they find in the Nile) and afterwards with straw; they then fill them two thirds full of foot, and put them into their holes on the top of the oven.

They make the fire gentle at first, and use the aforementioned dry dung for the fuel; they increase the heat gradually, till they bring it to the highest degree, which the workmen call *bell-fire*, and continue it so for three days and three nights together.

When the heat is come to its due degree, the smoke shews itself with a sourish smell, that is not unpleasant; and, in a little time, the salt sticks to the glasses, and covers the whole opening. The salt continues subliming till the above-mentioned time is expired: then they break the glasses, and take out the salt, just in the same form, and of the same substance, that it is sent all over Europe.

At each salt-work they have a glass furnace, to melt the old glasses, and make new ones.

Sal ammoniac is principally used by whiteners of copper-vessels, goldsmiths, and is a noted drug with chemists and physicians. Father Sicara, a missionary and an eye-witness, says, they add a little sea-salt, and urine of beasts. *Mem. de l'Acad. Roy. des Scien.* 1720.

Sal ammoniac is sometimes made by the chemists of urine, sea-salt, and wood-foot, boiled into a mass, and then sublimed.

Properties of *Sal AMMONIAC*. It is soluble in somewhat less than double its weight of water; and, if the solution be duly evaporated, it shoots into thin fibrous substances, resembling feathers. *Sal ammoniac* neither coagulates milk, nor changes the colour of a solution of sublimate. It makes a considerable effervescence with the vitriolic acid, attended with a great degree of cold. Exposed to a considerable heat, it totally sublimes, and if previously well ground with metallic, and certain other ponderous substances, elevates some part of them along with itself, and concretes with the rest into a mass, which, exposed to a moist air, readily flows into a liquor. Mixed with a due quantity of alkaline salts, it yields, by a small degree of fire, two thirds of its weight of pure volatile alkali; what remains in the subliming vessel, being dissolved in water, and crystallized, readily assumes the form of cubical crystals, like those of common salt, the properties of which it likewise possesses. *Sal ammoniac*, mixed with nitre, and injected into a red-hot crucible, boils up, and emits flashes of light; and thus betrays its animal original. Sublimed in a retort, with double its weight of chalk, it is said to be increased in its weight; (*See Mem. de l'Acad. des Scien.* 1735.) but the substance thus elevated is not to be regarded as a pure volatile salt; because, probably, one third of the quantity is owing to the chalk. A mixture of quicklime and *sal ammoniac*, set to sublime, affords an exceeding penetrating spirit, but loses nothing of its form of a solid salt; if the quantity of lime be considerable, the volatile alkaline part of the *sal ammoniac* will be almost totally absorbed by it. Lastly, of all salts, *sal ammoniac* most intensely cools the water in which it is dissolved, whose coldness, in hot water, equals that of water ready to freeze.

From what has been said, it appears, that *sal ammoniac* is a neutral salt, compounded of a volatile salt, and an acid. But it must be observed, that *sal ammoniac* is a very different substance from most of the preparations made from it; for, when alkaline salts are mixed with the crude *sal ammoniac*, they absorb the acid, which render the *sal ammoniac* neutral; and then the volatile urinous salts, being freed from the acid, rise in distillation.

Boerhaave says, that *sal ammoniac* preserves all animal substances from putrefaction; that its brine penetrates into the most minute parts; and that it is the noblest aperient, attenuant, resolvent, stimulant, errhine, sternutatory, diaphoretic, sudorific, antiseptic, and diuretic.

There are several preparations of this salt, made use of in the present practice of physic: as

Sal AMMONIAC volatile, volatile sal ammoniac. This is made by subliming *sal ammoniac*, mixed with salt of tartar. It is used for pocket smelling bottles; but Boerhaave, with the greatest appearance of reason, condemns the custom of smelling to these salts, as highly pernicious. Some put aromatics into the retort, which give it a more agreeable smell. It is prescribed in malignant fevers as a sudorific.

Spiritus salis AMMONIACI, spirit of sal ammoniac. This is a spirit distilled from *sal ammoniac*, mixed with salt of tartar, and dissolved in a proper quantity of water. Some use lime instead of salt of tartar, in order to encrease its volatility; but this should never be used internally.

The *aqua regia*, with which so many experiments are made, particularly in dissolving gold, is made from *sal ammoniac* and nitre. But the most celebrated medicine, now in the shops from this foundation, is the

Spiritus salis volatilis oleosus, the oily spirit of volatile salt. This is a spirit distilled from *sal ammoniac*, salt of tartar, and spirit of wine, impregnated with aromatic oils.

AMMUNITION, a general term for powder, ball, and other implements of war.

Ammunition, arms, utensils of war, or gun-powder, imported by way of merchandize, without licence from his majesty, are forfeited, and treble the value. 1 Jac. II. cap. 8. sect. 2.

Such licence obtained, except for the furnishing of his majesty's public stores, is void, and the offender incurs a premunire, and is disabled to hold any office from the crown. 1 Jac. II. cap. 8. sect. 3.

Arms, gun-powder, or salt-petre, may be prohibited to be exported by his majesty, when he shall see cause, by proclamation or order in council. 12 Car. II. cap. 4. sect. 13. and 29 Geo. II. cap. 16. sect. 1.

If shipped (after such prohibition) on board any vessel in Great Britain to be exported contrary to such proclamation or order, are forfeited, and may be seized by warrant from any magistrate, or by any custom-house, impost, or excise-officer. And every owner forfeits 100 l. for every hundred weight of salt-petre and gunpowder, and 100 l. for every twenty-five arms, and 100 l. for every two hundred weight of any species of ammunition; and so in proportion for a greater or lesser quantity. And every person aiding or assisting in shipping them, forfeits 100 l. and treble the value of the goods. Also any master of a ship who takes them, or suffers them to be taken on board, forfeits 100 l. 29 Geo. II. cap. 16. sect. 2, 3, 4.

This act, and every clause, matter, and thing therein contained, shall extend to empower his majesty in like manner to prohibit the shipping the same, in order to be carried coastwise. 20 Geo. II. cap. 16. sect. 5.

The penalties in this act are to be divided, two-thirds to his majesty, and one-third to the person who shall seize, or sue for the same by bill, plaint, or information, in any of his majesty's courts of Exchequer in Great Britain. 29 Geo. II. cap. 16. sect. 6.

AMMUNITION Bread, that which is served to the soldiers of a garrison or army.

AMNESTY, an act or edict, whereby a prince promises his subjects a general pardon for all that is past.

AMOMUM, among the ancient botanists, a small shrub, that grows twisting its woody stem into the form of a bunch of grapes. It bears a small flower like that of *leucosium*, and leaves like those of *briary*. The Armenian is esteemed the best, which is of a colour inclining to gold, of a yellowish substance, and remarkable

ably fragrant. The Median is weaker, as growing in flat and watery places. This is a large sort, of a greenish colour, soft to the touch, of a fibrous substance, and finell like *origanum*. What comes from Pontus is of a yellow colour, short, and not difficult to break, clustered like a bunch of grapes, full of fruit, and very odoriferous.

Though Dioscorides has given us the above particular account of the *amomum*, the moderns have not only been much perplexed in determining what the true ancient *amomum* was, but are not certain, that any such plant is now existing, or, at least, known to us.

The most probable account, however, of the true *amomum* is the following, given by P. G. Gamelli, in the *Philosophical Transactions*.

After I had seen the clustered bunch of flowers of the *tugus*, which some call *biras*, others *caropi*, and tasted the kernels of the grape, or the oblong seed, and compared them with the descriptions which the botanists give us of *amomum*, I became of opinion, that the *tugus* was the genuine *amomum* of Dioscorides.

This *tugus* is a plant, sometimes above a cubit high, with leaves like the plant *tagbac*, or *bagongbouque*, except that its under-part is covered with a delicate down, and that it is more fibrous, longer, and fragrant. At the root of the plant, or body of the stalk, from the very middle or heart of a foliaceous stem, sprouts out a parcel of floriferous and germiniferous leaves, an hand's breadth and half in length, in the figure of a cluster of grapes, having some resemblance to the pointal or bunch of flowers of the *amomum*, adorned with very red small flowers, which are succeeded by grapes, that run out in length with a neck, as though they were the relics of the tube of the flower, and are inclosed in a thin, sweet rind, whence they are mostly, together with the seed and kernels, devoured by the mice and birds, so that it can be had only in very small quantities.

These grapes commonly contain five or six reddish, oblong, unequal, aromatic, fragrant kernels, or stones less than the cubebs of the shops. It grows in Borongam, Paranas, Loyte, and other Philippine islands.

There are three different plants, to which the moderns have given the name of *amomum*. The first is the *AMOMUM Offic. Comm. Flor. Mal. 14. Plant. Ufu. 88. Raii Hist. 2. 1697. True amomum*.

The fruit of this plant, which is the part used in physic, is divided into three cells, and is of a very pungent taste: it is brought from the Philippine islands, and is reckoned carminative, alexipharmic, stomachic, &c. Geoffroy. The second is

AMOMUM, Offic. Sison. Mor. Urb. 14. Boerb. Ind. A. 57. Raii Synop. 3. 211. Bastard stone-parsley.

It grows in ditches, and moist places, flowering in the summer, and the seed, which is used as a succedaneum to the true *amomum*, is ripe in August. The third is.

AMOMUM, zinziber, or ginger called also *zerumbet*, or *zerumbeth*. The characters of this genus are,

The flowers are produced in a compact scaly head, each having a spathe, or leafy cover: the flower is of one leaf, having a short tube, and is divided into three parts at the top, the middle segment being longer than the other. In the center is one stamen, shaped like a leaf, which arises by the stile, and is of the same length, resting upon the germen; which afterwards becomes an oval fruit, divided into three cells, which contain many seeds.

Dr. Tournefort hath not mentioned any of the species of *ginger* in his institutions of botany; nor have we any good description of the *zerumbeth galingale* and *zedoary*, by which they may be distinguished. The only author who has well described this plant is Doctor Herman, who says it is the *zerumbet* of the shops; but does not distinguish it sufficiently from the *galingale*, or *zedoary*. The writers on the *materia medica* have only described the dried roots, as they have been imported, being ignorant of the plants whose roots they were; and it is but of late years that we have had the plants in the English gardens, therefore could not determine what they were.

The roots which I have seen, says Mr. Miller, sold

in the shops, for the lesser *galingale*, were those of the plant which Doctor Linnæus has titled *kempferia*; and it is figured by Doctor Kempfer, who calls it *Wanhom*. It is also figured and described in the *Hortus Malabaricus*; under the title of *katsjula kelengu*.

The general name of this and the common *ginger*, was *zinziber*, by which most authors who have mentioned these plants have called them: but Doctor Linnæus has altered their title to *amomum*; and has added to them the *cardamum* and *grains of paradise*; making them species of that genus.

Doctor Herman, in the *Hortus Lugduno-Batavus*, calls this plant *zinziber sylvestre latifolium*; and in Gareius it is titled *zerumbeth*. It is a native of India, from whence the roots are brought for use.

The root of this plant is the only part which is used in medicine; it is heating, drying, and is esteemed good to expel wind, comforting the bowels; and is frequently ordered for cholics, and other disorders of the bowels, as also to prevent vomitings.

The *zerumbeth*, *zedoaria*, and lesser *galingale*, are now pretty common in many curious gardens in Europe, where there are hot-houses with beds of tanners-bark; for, unless the pots in which their roots are planted be constantly kept in the tan-bed, the roots are apt to shrink; and when that happens, they frequently rot: for, by giving the plant much wet, they are soon destroyed, especially after they have been kept dry any time; which is also the case of the common *ginger*.

The roots of the lesser *galingale* were obtained from India in the year 1724, by Charles Duboise, Esq; of Mitcham in Surry, who communicated them to several curious persons in England; and they have been sent to many curious persons in Holland, France, and Germany. The *zerumbeth* and *zedoary* were brought to England about the year 1738, from Holland: and these multiply so fast, where they are properly managed, that many of their roots are annually thrown away.

The common *ginger*, which grows naturally in the West-Indies, has been long in the English gardens; but neither of these sorts made any progress here, until the use of tanners-bark in hot-houses was introduced; since which they all thrive as well as if they were in their natural countries; and large quantities of the root of ginger have been taken up for preserving in England.

There is another sort of *amomum* in the shops, known by the name of *amomum Plinii*. This is the tree nightshade. See SOLANUM.

Dr. Lewis, in his notes on the *Pharmacopœia* of the Royal College of Physicians at Edinburgh, says that the seeds of the true *amomum* are brought to us from the East-Indies in roundish pods, divided into three parts. The seed is rough, angular, aromatic, of a dark colour without side, and white within, solid, but easily pulverable, in which respect it manifestly differs from cardamom seeds, with which it is confounded in the shops. It yields, upon distillation, a considerable quantity of an aromatic oil.

AMORPHA, bastard indigo. This plant has been placed with the *barba jovis*, to which genus it is nearly allied; but the flowers wanting the keel and wings, and the pod being compressed, are sufficient to distinguish it from the other plants of that genus; which occasioned Doctor Linnæus to separate it, and to constitute a new genus of it, by the title of *amorpha*.

The seeds of this plant were sent from Carolina by Mr. Catesby, in the year 1724, which were sown in many gardens; and numbers of these plants were raised from them, some of which produced their flowers in a few years after; and now they are pretty common in most of the nursery gardens about London, being propagated and sold as a flowering shrub, with many other sorts.

It will grow to the height of eight or ten feet; but generally produces many branches near the root, which are placed irregularly; so that it will not make a good appearance, when it is placed single; but if planted among other shrubs, so as that the stems are hid from sight, the tops of the branches, when in flower, make a pretty variety; but as it is late in the spring before the shoots come out, these shrubs have the appearance of
being

being dead till the end of April, or the beginning of May; but when they begin to put out new shoots, they soon grow to a considerable length, and are furnished with long winged leaves, shaped like those of the common acacia, but of a darker green. The flowers are produced in spikes, at the extremity of the shoots, being generally three or four together: these spikes are six or eight inches long, and fully garnished with flowers, which are commonly in beauty about the latter end of June; but the seeds seldom ripen in England.

In North-America they have made a coarse sort of indigo from the leaves of this shrub, which occasioned their calling it *bastard indigo*; but since the true indigo plant has been there cultivated, the inhabitants have made no use of this.

AMOUNT, a term in arithmetic and book-keeping. It is said of the total, which several sums added together produce. Ex. See what is the amount of all those articles, or what those articles amount to. The first side of the expences amounts to 500l. the fitting out the London privateer will amount to 5000l.

AMPHIBIOUS, a term applied to such animals as live sometimes on the land, and sometimes in the water. Of this kind are the beaver, frog, otter, &c.

AMPHISCII, in geography, the inhabitants of the torrid zone; so called, because their shadow at noon falls at one time of the year towards the north, and at the other towards the south.

AMPHORA, the largest measure used at Venice for liquids. It contains four bigorzas, the bigorza being four quarts, the quart four sachie, and each sachie four leras; but by wholesale the amphora is fourteen quarts, and the bigorza three quarts and an half. Reduced to English measure, it may be said to contain four of our gallons.

AMPLIATION, signifies, in French, the duplicate which is taken or given of a receipt, acquittance, account, or the like. Thus they say, to sign a copy by *ampliation*, that is, to sign a duplicate thereof. In this sense they also call *ampliation* a copy printed upon paper, of a contract of sale of annuities on the city of Paris, engrossed upon parchment. Notaries, when they deliver the engrossed contract to the annuitant, ought also to deliver to him on *ampliation* upon paper, which he is obliged to produce to the paymaster, with his receipt annexed to it, the first time he has a mind to receive his annuity or rent.

AMPLITUDE of the sun or stars, in astronomy and navigation, is an arch of the horizon intercepted between the true east and west point of it, and the center of the sun or stars at their rising or setting.

Amplitude is of two kinds, eastern or ortive, or western or occative. Eastern, or rising *amplitude*, is the distance between the point wherein the star rises, and the true point of east, wherein the equator and horizon intersect.

Western, or setting *amplitude*, is the distance between the point wherein the star sets, and the true point of west in the equinoctial. The eastern and western *amplitude* are also called northern and southern, as they fall in the northern or southern quarters of the horizon.

To find the sun's *amplitude*, either rising or setting, by the globe, bring the sun's place to the horizon either on the east or west side, and the degrees from the east point, either north or south, are the *amplitude* required.

To find the sun's *amplitude* trigonometrically, having the latitude and sun's declination given, say, As the cosine of the latitude is to the radius, so is the sine of the present declination to the sine of the *amplitude*. Suppose, *e. gr.* the latitude to be 51 deg. 30 min. and the declination of the same 21 deg. 50 min.

Then, to the ar. co. of the co-sine of 50° 30' 0,2058503
Add the sine of 9,3118926

Sum of the sine is 9,5177429
Which is the *amplitude* required.

Magaetical *amplitude*, is an arch of the horizon contained between the sun at his rising or setting, and the east or west point of the compass; or, it is the difference of the rising or setting of the sun from the east or west

point of the compass. It is found, by observing the sun at his rising or setting, by an *amplitude* compass.

AMSTERDAM. Of all the great cities travellers are wont to visit, this seems to afford the least entertainment, to those whose heads and hearts are not entirely turned to pecuniary acquisitions: here every moment seems to be filled up in the pursuit of trade, with all its various and extended connections. The people have no time to complain of a bad climate, bad weather, or the want of health: they have hardly leisure to perform the common duties of hospitality and benevolence.

This wonderful city of *Amsterdam*, as well as many other towns of the Netherlands, is certainly a work of art and labour, not inferior to the greatest monuments of human industry in past ages. It is about 220 English miles from London: its proper name, as derived from the river *Amstel*, is *Amsteldam*, i. e. the dam of the *Amstel*, which is the name generally given to it in authentic records. From its earliest beginning they reckon about 400 years; and 270 from its being inclosed with walls. It was not till the year 1570, that the Dutch began to lay the foundation of their prodigious riches and naval strength. About twenty years before this time they were provoked, by the oppressive measures of Romish bigotry, to shake off the Spanish yoke, and adopt the doctrine of Calvin. The Spaniards exerted themselves, upon this occasion, upon religious, as well as political principles; but it was not in their power to render that confederacy abortive, which at length united the seven provinces, and, forming a powerful republic, gave a just occasion to this motto; "*Concordiâ res parvæ crescunt.*"

About the year 1600, the love of liberty and gain occasioned such a conflux of people, that the walls of the city were extended; since that time they have had further enlargements, the whole now making about three leagues in circumference. Her greatest strength is in the difficulty of access, both by sea and land; yet have not the numerous shoals, which render the entrance of the Texel so difficult, obstructed the progress of her commerce. One striking proof of economy is very obvious, even in the fortifications of this city; for the bastions, which are very numerous, have each a wind-mill on them.

The streets are, for the most part, extremely clean; but except those which have canals, much too narrow for beauty or convenience. They are rendered the less disagreeable, as the hired coaches are set on sledges, drawn by one horse, which do not greatly incommode passengers. Merchandise is also drawn on sledges. These are not only the most convenient vehicles for the inhabitants, and their trade, but also calculated to preserve their houses, which being built on piles, might, in length of time, be much damaged in their foundations by means of a great number of wheel-carriages. The coaches of gentlemen are, however, for the most part, set on wheels; but they pay a considerable tax for this liberty. The principal streets, or rather quays of the canals, are agreeable, particularly the *Kyazergraft* and *Heeregraft*, which are planted on each side with trees; but the canals sometimes throw up a very offensive stench. The people are not at a loss how to account for this inconvenience: sometimes it is owing to nature; but it is apparent, that the discipline of the state is relaxed by the canals not being kept so clean as the regulations require: these canals, in some parts, are of a considerable breadth.

The houses in *Amsterdam* are rather neat than elegant, or commodious: the nature of the climate renders it necessary to wash then often; but the greatest part of the people carry their cleanliness this way so far, as hardly to afford themselves time for the necessary care of their persons. The same humour prevails amongst them, as with some of middling fortunes in England; they shut themselves out of their own houses, by keeping the most useful and agreeable apartment for the entertainment of their friends on particular occasions, that is, for vanity.

The entrance of their houses is generally by stairs four or five feet from the ground, and the passage into the rooms, which run very deep, is floored and paneled with marble, which has an air of grandeur in miniature. They

with improvements
by J. Roberts.

They have much neat, and some rich furniture; but it does not seem to be the effect of a luxurious and expensive taste, so much as the observance of an ancient custom of neatness and elegance. At the worst, it may plead its being less dangerous to a state, than the constant expense of a table, equipage, or amusement; and these are not countenanced in *Amsterdam* in any remarkable degree.

This city is generally esteemed one third as populous as London and Paris. They reckon within the walls, twenty-six thousand five hundred houses, and about two hundred and forty thousand inhabitants: the suburbs, though small, must add to this number.

The grand rendezvous of the merchants of this metropolis, as in other great trading cities, is the exchange, which was finished in 1613. The interior part is two hundred and fifty feet long, and one hundred and forty broad; but much inferior in architecture and embellishment to that of London. It is supported by forty-six pillars, which are marked with numbers; and the merchants take their stands near particular pillars, to be found the more easy. The city of *Amsterdam* is guarded by a militia, as the safest and most proper defence of their wealth and liberty; these are all burghers, and consequently no objects of jealousy, nor do they cause any considerable expense.

Nothing adds more to the beauty of this city, as well as of the country in general, than the plantations of trees for the public use and pleasure; an inclination which seems to prevail very much, and is highly worthy of imitation. In England things of this sort are often done; but more for private gratification, than the general delight of the people; so that the lower classes are the more apt to crowd to gardens, where they pay their money, waste their time, and sometimes debauch themselves with excesses. We may observe, however, to the honour of Great-Britain, that within these thirty years, great improvements have been made in many parts of the kingdom: works of this nature for the public recreation, are certainly worthy of the best citizens, the most zealous patriots, and greatest princes.

The province of Holland is said to pay half the tax of the whole seven, and *Amsterdam* half of the province of Holland; from whence one must conclude, that there are immense riches in *Amsterdam*, or no great wealth in the seven provinces. The revenues of *Amsterdam* are reported to be a million sterling; and consequently the whole must be four millions; which greatly exceeds the reality, or it is meant only in time of war. Sir William Temple estimates their ordinary revenues in his time at twenty-one millions of guilders; but he says the revenues of the province of Holland, including *Amsterdam*, were reported to be one million six hundred thousand pounds: most calculators have made it three millions; but as things are circumstanced at present, we must not compute it above two millions of English money.

In 1665 they raised forty millions of guilders, and of these, the province of Holland only, paid twenty-two millions; which is nearly correspondent with the account they now give of the proportion this province bears to all the others, as already mentioned.

It may be worth the enquiry of the curious, how vastly the taxes in the United Provinces exceed those of Great-Britain, in proportion to the number of inhabitants. They generally calculate two millions of people in the United Provinces; and two millions at the lowest computation are annually paid in taxes: now as we compute eight millions of people, if we were to pay in proportion, our taxes should be eight millions. The United Provinces are reckoned to contain only 7500 square miles; whereas, England has 49,450 square miles; consequently these provinces are six times as populous as England. How industry flourishes among them is apparent, even if they pay but two millions; since considering the goodness, and extent of our country, and the barrenness of theirs, we may suppose ourselves capable of paying six times as much in taxes as they; whereas we pay but three times, as above-mentioned. The truth is, they acquire riches by sea in a double capacity, that is, by commerce and fishery; and we may

conclude, from this general view, of what great consequence their fishing is to them.

The trade of this city was raised chiefly on the ruins of *Antwerp*, once the mistress of the commercial world, till the fiery zeal of priests, and the insolence of military authority, trampled equally upon the laws of justice and humanity; and, lastly, upon commerce, the support of nations. Towards the close of the sixteenth century, the Portuguese also, from being the greatest traders to the East, began to decline in their commerce, which gave the more room to this new colony of merchants, who had many of the requisites to carry trade to its highest pitch, though their country does not produce one single material for building ships.

Amsterdam is a prodigious magazine of timber, corn, wine, and many other commodities of foreign European production. The inhabitants excel in dyeing, sugar-baking, bleaching of linen and wax, manufacturing of paper and sail-cloth, with no inconsiderable quantity of silk and wool. Their whale-fishery generally produces great riches, and their East-India trade is of the highest importance to them, both in Europe and Asia: the article of spices only is a mine of gold, which they have preserved with more care and assiduity, than if it had been really such. Here are also great repositories of gold and silver, precious stones and choice drugs, from different parts of the world.

Of all the public buildings in *Amsterdam*, either for use or ornament, the town-house is the most distinguished; the foundations of it were laid in 1648, and in seven years the building was so far advanced, that the magistrates took their seats in it. The Latin inscription on a black marble pedestal, the representation of which constitutes part of the subject of a relieve, is to this purpose:

“The United Provinces of the Low Countries, after having bravely supported a bloody war by sea and land in every region of the earth, against the three Philips, most powerful kings of Spain, for more than 80 years; and by that means secured their liberty, and the exercise of their religion, the most honourable burgomasters,

Gerbrant Pancras,
Jaques De Graaf,
Sybrant Valkenier, and
Pieter Schaaap,

made the peace in their magistracy in 1648, their sons and relations laying the first stone of this town-house, the 4th of November of the same year.”

The dimensions of this building are 282 feet in front, 232 deep, and 116 high, exclusive of the cupola. It cost three millions of guilders, when money was more valuable than it is now: this may be the more easily reconciled, if we consider that no less than 13,000 large piles were driven to make a foundation for this ponderous burden. Whether in this sum they include all the plafonds, and other paintings, of which here are some very valuable, is not essential to our present purpose. Behind the seat of the presiding burgomaster is a complimentary inscription in Dutch verse, wrote by C. Huygens, one of their most eminent poets, which seems to argue the sense they had of the secure establishment of the state at that time.

We may consider this edifice as a very grand and useful building, but not elegant nor agreeable. It contains most of the offices and tribunals, for the execution of the laws, in the several branches of the military as well as civil government.

It is constantly remarked by foreigners, that the entrance of this building is very mean, and not worthy the other parts of the structure; the reason assigned for this is, that in consulting the strength and usefulness of this work, the architect purposely neglected the beauty of it. Had the doors been proportioned, they would have been more subject to be forced, upon occasion of those tumultuous assemblies of the people, which are not unfrequent in this country. The *Stadthuse* is guarded, during the night, by a body of the burghers, who are thus charged

with the care of the great reservoir of the wealth of the United Provinces. In the lower apartments of this building is the bank, in which are supposed to be deposited immense treasures: the keys of them are deposited in the hands of the four regent burgomasters. Some report that these treasures amount to three hundred tons of gold; and those who have faith enough to think it true, have this to say, that the value of so much gold is not above thirty-two millions sterling; and the debt of the United Provinces is yet larger. The real sum here deposited is perhaps not known to any one person living; and even the computation in the gross, except such as already mentioned, is kept as an impenetrable secret; and no doubt there are many good reasons why it ought to be so. See BANK.

The city of *Amsterdam* has infinitely the superior part over all other places in these countries: here all the fleets of ships arrive, as the herring-fleet, the Greenland, the East country, the Turkey, and the East-India fleets, with the fleet of men of war, or the national fleet. Among these, particular ships belong to the chambers of Rotterdam and Zealand, and to the merchants there; but the grand arsenal, both for war and trade, is at *Amsterdam*; the ships, stores, furniture of the men of war, and East-India ships, being all laid up there; and, indeed, *Amsterdam* seems to be a general mart for navigation, more ships for sale being built in it than in any place in the world; and not only ships, but fleets may be bought, if there is an occasion, together with naval stores of all kinds, ammunition, and arms, having a sufficiency for all the nations of Europe.

As the navigation is managed here, so is the merchandise they bring. Here the India-house and warehouses are kept, and goods sold; here are the admiralty offices, and the building-yards and docks, not for their own shipping only, but for all nations that please to employ them; here is the bank, the only one in the country; the exchange, the greatest in Europe, that of London only excepted. In short, there is not a city in the world, so rich, so populous, or that carries on so great a trade in so narrow a compass of ground. It is frequently surrounded with water, that threatens to swallow it up, and yet seldom or ever receives any considerable damage; and the number of ships and vessels of all sorts, which are always lying before it, is so great, that it is thought, should any general inundation of the sea drive them to that dreadful necessity, all the people in the city might at once embark, and be saved from drowning.

It is generally believed, and by many affirmed, that more insurances are made at *Amsterdam* than with us, or indeed in any other part of the world; their extensive commerce by sea, and the extraordinary number of vessels continually sailing from thence, naturally occasions many to follow the practice of insuring; but what has yet augmented this business, and multiplied the policies of insurances almost to infinity, has been that honour and integrity with which their underwriters were formerly characterized, as their policies were then only subscribed by men of large fortunes; but whether great losses, or a subsidizing of that courage, before so conspicuous in that small number of the rich, then constituting the body of underwriters (for Mr. Savary and Mr. Ricard say, they did not exceed fifty or sixty) occasioned their withdrawing from business, we shall not pretend to determine; but it is certain, their number during the late war was greatly increased, and their chicaneries at least equal to those of their neighbours and contemporaries; and had they not admitted business on worse terms than here, that is, at lower premiums, there would not have been that recourse to their city, as the many failures among the insurers plainly demonstrated they had changed their set, and that many of less credit and fortune were admitted to subscribe, than the wealthy few above-mentioned.

The first ordinance in that city, which regulated the policies of insurance, was about the end of the sixteenth century; it was originally digested into thirty-six articles, but many of these have since been reformed, new-modelled, or explained, by twelve subsequent ordinances, of which the principal ones are those of the years 1600,

1601, 1606, 1607, 1614, 1626, and 1688, and it is by this last, that the policies of insurance may be said to remain fixed, though some few alterations have been made since.

But Mons. Jean Pierre Ricard, in his book *Le Negoce d'Amsterdam*, having given an account of the articles made at the several times above-mentioned, with his remarks on them; I shall translate as much of them as I judge may be worth the reader's regard, and in doing it shall follow the author's method.

NUMBER I.

1st Article, "Declares, all contracts of insurance null and void, which are made in this city contrary to law, by any stipulations, conditions, or words they shall contain."

Remark. This article is not always strictly followed, for many insurances are made which are not exactly conformable to the ordinance, and others directly contrary to it, as will be seen in the following remark; but when this happens, a clause should be inserted in the policy, by which the insurers expressly renounce all the law, ordinances, and placarts, which are against such an insurance; and in case of a loss, and that the insurers will not settle it amicably, the assured may cite them before the sheriffs, or the court of Holland, and bring them to reason, and not before the chambers of assurances, because the renunciation made by the insurers includes an exclusion from this court, which can only determine in conformity with the ordinance.

2d Article, "Prohibits the making insurance on goods for more than $\frac{1}{10}$ of their clear cost abroad, when it does not exceed 12000 guilders, but permits the surplus of that sum to be insured, provided the assured runs the risk of the $\frac{1}{10}$ of the 12000 guilders."

Remark. This article is very rarely observed, and there is hardly any policy which does not contain these words, and the assured may cause himself to be insured the whole, without risking the tenth, we taking on us the entire value even with the premium included, and I do not see what occasion the assured has to run a risk of the tenth, as the difference of 1200 guilders on an insurance of 30 or 40000 is but trifling to the underwriters; however, notwithstanding it is so inserted in the policy, that the whole is insured, yet if the insurer disputes payment in case of a loss, and is cited before the commissioners, they will have no regard to this clause; but on finding that the assured has not run the risk of the tenth of the 12000 guilders, they will make him run it, by obliging him to return the premium of what exceeds the tenth, or by adding it to that part of the loss, which the assured ought to bear.

3d Article ordains, "That the policies contain the name of the ship, and of the captain, that of the places where she is to load, and go to, under penalty of the policy's being void, if the fault is in the assured; but if it comes from the broker, he shall be answerable for it."

Remark. It is very necessary to observe this article, in all its contents very nicely; because, that besides that the assured have an opening to deceive the insurers, by wilfully omitting the name of ship or master in the policy, many disputes may happen, and that the underwriters may, by having always insured a very large sum on the same ship, be rendered scrupulous of signing such policies.

However, there are cases, where it is impossible to know upon what vessel there will be an interest, by reason of the distance of the place from whence goods and effects are expected; as for example, from *Curacao*, *Surinam*, *Archangel*, or other remote parts, from whence effects and the advice of their loading, are frequently received together; and as it would be very hard for a merchant who expects effects from those parts, to find that he is unable to get himself insured, only for want of the name of the ship and captain, it may be remedied by inserting in the policy, that the insurance is on goods, to be loaded by such a one, in one of the first ships that shall come from thence.

The Spaniards frequently get insured at *Amsterdam*, on any vessel or vessels, which have loaded goods at La Vera Cruz, or elsewhere, in the Spanish West-Indies, to their address; but there is found such deceit in these contracts, by the concerned sending false declarations, that they had not received any thing upon any ship of the *flota* or *flotilla*, when they had, and returning the premium, as has made the greatest part of the insurers resolve not to underwrite to those gentlemen, but on conditions to make no returns, although the assured should have no interest in the fleet.

4th Article ordains, "That the insurance on goods shall begin from the moment they are brought on the key, to be carried on board the ship destined to transport them, and shall endure till they are arrived at the place of their consignment, and are unloaded in safety, and free from damage."

Remark. There are some who imagine they have no right to be insured till the goods are loaded, and bills of lading signed; and others, who receiving advice from abroad, of freight being taken on a ship and captain named, believe they ought not to insure, till they receive advice of the departure of the ship, or at least till they have got the bill of lading and invoice, in which they greatly err; for besides that, the policy expresses, *on goods laden or to be laden*, the article before-mentioned seems to suppose the insurance made before the embark- ing; but it is not to be imagined, that if the merchandize has suffered in going abroad, and is afterwards insured, that the insurer is obliged to pay the damage, on pretext that it is said in the policy, *that the insurance shall commence from the moment that the goods are upon the key, &c.* This would be very unjust, therefore it ought to be understood only, when the assurance is made before the goods are taken out of the warehouse, or before they are sent abroad; for besides the risk which the assured runs in shipping them, (which is greater in some places than others) he likewise exposes himself to pay a higher premium than if he had insured sooner; because the more insurances there are made on a ship, the higher premiums the insurers demand; and it is further to be remarked on this article, *that although the risk is not finished till the goods are unloaded and safe*, that as at *Amsterdam*, they are frequently left in the lighter for five or six days or more, the insurers are not obliged for any damage that may happen to them, only for the first day.

5th Article says, "That if in a year and a day, after the insurance made, or after the ship's departure, if it is for any part of Europe or Barbary, there is no news of her at the place from whence she sailed, nor at that she was bound to, she shall be esteemed as lost, and the assured may demand payment from the insurers in three months; but for places more distant, the term shall be that of two years."

Remark. It too often happens that ships founder at sea, so that no person escapes to tell the story, and our underwriters do not postpone payment according to the preceding terms, as this would oblige them to a total loss, that is, *cent. per cent.* but in order to lessen it something, when they see the assured has no advice of the ship, and when she stays two or three times longer than she should, so that there is no room to suppose her safe, they themselves endeavour to agree with the assured, and commonly pay ninety-six *per cent.* on such occasions.

6th Article declares, "Those assurances to be null and invalid, which are made three months after the departure of the ships destined for the coasts of Europe, Barbary, and the adjacent ports, or those made in six months after the ship's departure for more distant places, if the assured does not give notice to the insurers thereof, and if he does not get himself assured, on good and bad news, that is, lost or not lost."

Remark. That as the articles 20 and 21, have an affinity with the foregoing, I shall remark on them all together.

20th Article imports, "That it is permitted to insure ships, merchandize, and effects, that are lost, pillaged, or damaged, even after the loss, &c. has happened, provided that the assured has no advice of the loss, &c."

21st Article says, "That the assured shall be supposed to have known of the loss, &c. if he has omitted to

make insurance, till after he can have received advice either by sea or land, counting three leagues of way, or two hours of time; and that then the insurance shall be void, notwithstanding (or *maugre*) all the proofs of ignorance the assured may be able to give; unless he is insured on good and bad news, and that he can swear that when he made the insurance, he had not the least account of the loss, &c."

Remark. By these three articles, which seem to be made in favour of the insurers, they are notwithstanding sometimes exposed to the cheats of people, who make no conscience of a false oath, provided it brings gain, and therefore the insurers seldom underwrite in these cases to unknown persons, or at least in prudence they should not; and what may be gathered from the said third article, is, that the ignorance of the assured, in regard of the ship, or touching the good or bad advices concerning her, are the two only conditions which can render the insurance valid, and therefore the oath is very necessarily ordained in these cases; for what would be more unjust, than to insure a thing known to be lost, which could never enter the thoughts of an honest man? But as these articles permit an insurance to be made, whilst the loss, pillage, or damage remains unknown, consequently it may be done on a vessel suspected to be lost after a storm, or feared to be taken by an enemy, from some confused flying reports about her, though without learning any thing certain; for example, suppose a storm to happen, with many ships in the *Texel*, and that several of them were seen to drive, and among others, such and such a one, and that it is feared they may be lost; in which case, the concerned, knowing that there will at least be large averages, and that there is no room to suspect a total loss, if no advice is received in two or three days; yet as this is uncertain, and cannot possibly be known, the interested person may make insurance, if he can find those that will underwrite, after the advices above-mentioned, on payment of a premium proportionable to the risk: it is the same with respect to a ship which is said to be taken by the enemy, though the report is unconfirmed, and all other similar cases, in which the insurance will stand good, provided it is inserted in the policy, the last news there was of the vessel, and that the insurance is upon good and bad advices, of which the assured can swear that he knows of no others at the time of making the said insurance.

7th Article declares, "That the insurance shall be null, if the assured makes his ship to touch at any other ports than those mentioned in the policy; but if this be done by the master, either through choice or necessity, without the assured's order, it shall not hurt the insurance."

Remark. This article, though so very clear as to explain itself, is notwithstanding very often the occasion of many disputes between the assurers and assured; the former endeavouring to make the first part of it serve as a just plea for non-payment of a loss or average happening in any port mentioned in the policy, if a declaration of the captain and crew is not very express, that he was obliged to go into it through necessity; in which case, the insurers have nothing to reply, because the affidavit of the master and his men is credited, and the underwriters are condemned without the least difficulty; but as it frequently happens, that a ship goes into some port by order of the owner, or principal freighter, unknown to the other loaders, it is very important to remark the sense of this article, and to distinguish him who knew that the vessel would touch at certain ports, from him who loaded only for one, and did not know that she was to call at others: for example, ships are daily set up at *Amsterdam* for *Bordeaux*, and the merchants load aboard them, without enquiring or imagining that they are to stay at any place by the way, and make their insurances for that place; nevertheless, it happens that some one has a considerable parcel of goods to ship for *Rochelle*, and not finding a ship ready to depart for that port, he agrees with the master loading for *Bordeaux*, to take his goods for *Rochelle*, and obliges him to deliver them before he proceeds to *Bordeaux*; if this is transacted without the knowledge of him who makes insurance for *Bordeaux* only, and any mischance happens

pens to the ship at Rochelle, this shall not occasion a nullity in the policy of him who was ignorant that the vessel must call at the latter; but there will be one in the policy of an owner of such a ship, who has got insurance made on her directly for Bourdeaux; because, according to this article, he could not direct her going into any other port, but that mentioned in the policy, and that it is supposed he knew, when he made his assurance, that the ship was to touch at Rochelle; for if he did not know it till after his policy was signed, he ought to have got a clause inserted therein, that the ship should have liberty to call there.

It every day happens, that vessels which are loading for Marseilles, Genoa, and Leghorn, take in goods for Cadiz, Seville, Barcelona, and other ports in their way, without its being known to those who shipped for the first three places, and who only get their interest insured to that one of them, where the merchandize went consigned, without inserting in the policy, a liberty for the ship to touch by the way at the aforesaid ports, and the insurers do not use to make any dispute about it, with the shippers who were ignorant of it, because they know well enough, that it is customary for such ships to take in merchandize for different places; but an owner who insures, for example, from *Amsterdam* to Leghorn, without putting in the policy, that the ship may touch at, or go into all ports that are in her route, his insurance shall be discharged, if the vessel is lost in any one of the ports in which she shall have entered, &c.

8th Article, "Limits the assured for six months for abandoning any ship or effects to the insurers, which some foreign power has stopped and detains, when the detention is on the coast, or within the limits of Europe or Barbary; and one year, if it is in any more remote place, counting from the day that the brokers shall have given notice to the insurers thereof, by directions from the assured; and it permits these latter, within the times so limited, to take their precautions against the underwriters, by securities, pawns, or otherwise, as they shall think proper, permitting them besides, or their agents, to land the merchandize reclaimed and released, upon other ships, to be carried to the place they were designed for; and if the assured omit it, the insurers may do it; in which case, these latter shall only be obliged to defray the expence of loading and freight, and to pay for any damages the goods may have suffered, during their embargo."

9th Article, makes an exception in the before-mentioned time, in respect of perishable commodities, such as fruits, wines, grain, &c. in regard of which, "The assured shall not be obliged to wait the expiration of the said six months, but may endeavour to obtain their release in the manner he deems best, though he must make the insurers acquainted with the condition the merchandize is in."

Remark. In the two preceding cases of a detention or arrest, the insurers leave the care of reclaiming what shall be so stopped to the assured; but these should not fail to be well and duly authorized by the insurers, which authorization is invalid, except made by the huissier (an officer) of the chamber of the insurers; and therefore it imports the assured not to neglect having it made by him that may effectually serve them, in case the insurers should make any wrangling about the charges of reclaiming, &c. as these commonly are exorbitant, and frequently occasion great disputes; to avoid which, the assured should absolutely do nothing, without the consent of the underwriters; and where the sum is pretty heavy, it will be advisable to engage one or two of them to act in concert with the assured, at least in obtaining the release of the embargoed effects.

If the merchandizes reclaimed are released, and loaded on some other ship, in order to finish the voyage, the assured should not fail to make the insurers declare it by a clause at the bottom of the policy, by which they acknowledge, to be advised that the ship, upon which the merchandize insured was loaded, having been embargoed, it was shipped on board such other vessel, and that they continued the same risque, as they run on the first ship, to their destined port.

10th Article, "Prohibits the making insurance on the

body of the ship's guns, and warlike-stores, for above two thirds of their value, and to insure in any manner whatsoever, the freight, stores, powder, balls, victuals, or such like consumable things."

Remark. This article was too burthensome to owners of ships, in obliging them not to insure above 24000 guilders, upon an interest of more than 35, or 36000; so that their risques were reduced to an eighth part of the value of ships, by the first article of the ordinance of the 26th of January, 1693, as will be seen hereafter.

11th Article, "Prohibits masters of ships, mates, sailors, men at arms, and all others, who serve abroad, to insure their salaries, or any thing that belongs to them, except they have goods with them above the import of their wages."

Remark. This article is founded on substantial reasons, of which the principal is, as I imagine, that as the owners are not obliged to pay the mariners after losing their ship, these latter commonly endeavour all they can to save her, when in danger, in order to secure their pay; and it is certain, that they would not act on such occasions, with so much warmth, if their wages were insured.

12th and 13th Articles, "Limit the time in which the assured are obliged to bring their action of damage or average against the insurers, viz. a year and a half, if the loss or damage has happened on the coasts of Europe or Barbary, and in three years, if it has happened in more distant regions; to be reckoned from the time of the ship's entire discharge, or from the time in which the loss has happened."

Remark. The case very seldom happens, that the assured wait so long a time to demand their loss or average from the insurers, or at least to let them know that they have one to settle, which is sufficient for commencing an action against them, in case of refusal, even when they cannot know till a long time after, what the said loss or average will amount to.

14th Article says, "That all the preceding orders are to be understood, for assurances made on every thing that goes by sea, &c."

15th Article, "Regards the insurances made on goods, carried by land, or rivers, the which the merchants may contract among themselves, as they shall think proper, except that the assured shall run the risque of the $\frac{1}{10}$, as in the second article of this ordinance; and that the carters or waggoners shall not insure above half the value of their carts, waggons, or horses, and nothing of their wages."

Remark. There are very few of these sorts of insurances made at *Amsterdam*; therefore I shall not stay to make any observations on this, or the subsequent article 16, which is only to "allow the assured a year's time to demand from the insurers the recovery of the loss or average, which has happened to the goods, going by land or river."

17th Article ordains, "That if insurance is made upon grain, fruits, wines, oils, salt, herrings, sugar, quicksilver, tallow, butter, cheese, hops, syrup, honey, seeds round or flat, and such like things as are subject to corruption; upon ammunition, and upon silver coined and uncoined, they shall be specified in the policy, upon penalty of its being otherwise null and void."

Remark. The alteration of this article, will be seen in what follows, at number 3.

18th Article, "Permits the contracting parties in assurances, to make them before notaries, registers, or other public officers, or by private notes of particular persons, or before credible witnesses."

Remark. As this ordinance was made on the 31st of January, 1598, it appears that but few insurances were made then, as they were permitted to be under a private firm, and upon common paper; but the number of them having considerably increased since that time, it was necessary (as will be seen in the sequel) to ordain a set form, and to have it marked by the secretary of the chamber. For a long time all sorts of policies were drawn up indifferently, under the twelve silver-seals; but by the regulation made by the states of Holland and West-Frise, upon the duty of the small seal, of the 28th of August, 1716, in the 56th article, "It is ordained that all the policies, for

sums under 500 guilders, shall for the future be made under the twelve stiver-seals; those of 500 guilders, and less than 10,000, under the twenty-four stiver-seals; and those of 10,000, and upwards, under the forty-eight stiver-seals."

But as it would be imprudent in the brokers to hazard a sealed policy, when their employers order them to get a sum insured at a limited price, or on such conditions as they doubt will not be complied with, they have small policies on common paper, which they often get the underwriters to sign, and afterwards to transfer their firms to such as are ordained by law, when the insurance is completed.

19th Article, "Orders all those concerned in policies, to make them out according to the ordinance, and to keep a copy, *verbatim*, of all the hand-writing therein."

Remark. This is so much the more necessary, as the assured may happen to tear, or lose a policy, or that some knave, who has got himself insured, may alter something therein to his benefit, and disadvantage of the insurers; in which case, and in other similar ones, the copy which the broker keeps, may serve for a proof and testimonial.

I have already spoke of the articles 20 and 21, under the 6th.

22d Article, "Permits the assured to demand a return of premium from the insurers less $\frac{1}{2}$ per cent. if he does not load the goods, or those are not shipped for him, on which the insurance was made, or if he has insured more than the value of the merchandize he has shipped, or is shipped for him."

Remark. When a return of premium is demanded, it should be done as soon as possible, to remove all suspicion from the insurers, of an intention to cheat them in case of damage; and if one insurance is made on a ship coming from a distant port, in the expectation of having some goods by her, which on her arrival, is found to be otherwise, the assured should shew the underwriters, when he demands the return, the letters he may have received, with the advice that his correspondents could not send him any thing by that occasion; or at least a declaration from the captain attesting, that he brought nothing for the assured; for without this, he will not be unlike those people, who finding their merchandize safe arrived, are so dishonest, as to affirm they had nothing aboard, in order to procure a return.

23d Article, "Ordains, that the last underwriters shall participate in the insurance, as much as the first, either in profit or loss."

Remark. With regard to profit or loss, one insurer may have more than another in the same insurance; for when a very large sum is to be insured, and a good part of it is done at a certain price; for example, at three per cent. but a sufficiency to complete it is not to be obtained on these terms, the premium is raised to four per cent. in which case the last underwriters gain one per cent. more than the first, if the adventure arrives safe, and lose one per cent. less than the others, in case it does not; but it is not in this respect, that this article is to be understood; for it only ordains, that each insurer shall partake of the profit or loss, in proportion to the sum he has signed for, viz. if one insurer, who has underwrote at three per cent. gains the premium, he that he has underwrote for four or five per cent. gains it also; and if he that has signed for three per cent. pays fifty or sixty per cent. loss or average, he that has by his firm obtained four or five per cent. shall pay neither less nor more than the other.

24th Article, "Orders, upon pain of nullity, not to make insurance upon the life of any one, nor upon any wager of a voyage, nor any such inventions."

Remark. As there is no point of practice, or subtlety in the world, either to gain or preserve money, which has not been found out or invented at *Amsterdam*; this article is not always religiously observed, and there are people, who, having a post, which for example, may bring them in 3000 guilders *per annum*, get that sum insured on their life for a certain number of years, that if they die, their family may enjoy the revenues, for the remainder of the term insured; but these are very ticklish insurances.

25th Article imports, "That the assured having abandoned in form to the insurers, these latter shall have three months time allowed to pay the sum they have underwrote for."

Remark. The insurers are obliged to pay the sum insured, entire, without any deduction, in case they take the above-mentioned three months to do it in; but the common custom is, for them to have two per cent. abated in case of prompt payment on losses well proved; for if the proofs are insufficient, the insurers endeavour to take advantage of this circumstance, to pay as little as possible, and the assured must get as much as they can, or wait till they have procured proofs of the loss, in all the forms by law required.

26th Article, "Says, that if the gross average does not exceed one per cent. the insurers shall not be obliged to pay it."

Remark. Averages of two or three per cent. happen so often, that the insurers find no advantage in this article, and therefore they have for a long time agreed to sign no policy, which does not free them from any average under three per cent. as also to be free from the expence of *Jours de Planche*, (which are those days a ship is to lie by custom or charter-party, more than what is necessary to load or unload her cargo) and as they are frequently obliged to pay averages upon wool, flax, and hemp, they have for some years past agreed among themselves, not to insure on these three sorts of merchandize, except free of average, under ten per cent.

Nevertheless, when the insurers are sued, the commissioners of the chamber have no regard to these clauses, but condemn the underwriters to pay all averages that exceed the one per cent. in conformity with the ordinance.

27th Article, "Frees the insurer from paying the damage or loss, upon things that corrupt and spoil from their own imperfect nature, when some foreign cause or mischance has not contributed to it."

Remark. If the grain, fruits, or other such merchandize, happen to heat, or the wine, brandy, oils, and other liquors, are spilt and leaked, without any thing contributing to it, the damage is the assured's; but if it is occasioned by the sea-water in a storm, or by a shock of the ship against some bank of sand, or any similar cause, the damage is for the insurer's account.

28th Article, "Obliges the insured to give notice to the insurers of the advices they receive, of the mischances, embargoes, and damages, which happen to the ships or effects insured; and that the brokers, or other public persons, do make minutes of such notices."

Remark. The assured are so much the more obliged to give this notice to their insurers, as it is they who must pay the damage, in case of a disaster; and if the assured does the least thing unknown to the underwriters, and without their consent or authority, and that what the assured shall have done to prevent a greater ill, turns out the reverse of what he expected, there are many cases in which the insurers would not be obliged for the damage, and others in which they may have room to wrangle a great deal, to lessen their loss.

29th Article, "Imports, that this ordinance ought to be understood generally, for all the insurances which shall be made in this city, as well by the subjects of this country as by strangers; and upon all sorts of merchandizes and effects, going and coming both by sea and land; and if they are contrary to the ordinance, they shall be null and invalid, as is mentioned in the first article."

Remark. I have already observed on the first article, that many insurances were made, which are not entirely conformable to the ordinance; and I have nothing more to add here, but that use and custom have introduced many things which are contrary, but one ought to be extremely sedulous, on making any insurance contrary to the ordinance, taking care what insurers underwrite the policy, and inserting all such clauses, as may leave no room for dispute, or to have them annulled by the chamber of insurances, or by the other courts of justice, in case of being obliged to come before them which will, in a great measure, depend on the ability and forecast of the broker.

30th Article, "Forbids the commissions of the chamber of assurances, their secretary and clerk, and all insurance-brokers, to insure or to be insured, directly or indirectly."

Remark. It may be seen, that this prohibition, with respect to the commissioners and secretary, is taken away,

by the ordinance, *Number II.* But in regard to the sworn-brokers, as they take an oath not to do any business on their own account, when they are admitted, they can neither insure nor be insured, without contravening or breaking their oath; nevertheless, there are many, who have ships and parts, which they every day get insured.

31st Article, "Orders to punish exemplarily all those who shall use any fraud, misdemeanor, or cheat, in assurances."

Remark. Insurances were invented and introduced, purely with the design to relieve merchants in case of a loss, by sharing as much as they thought proper to get insured; therefore, it would be acting very unjustly, to aim at gaining or enriching one's self, by making the insurer's loss, as has happened more than once, by thieves and knaves, who have insured large sums on ships, on board which they had nothing, or things of a very small value, which they have in concert with the captains procured to be lost, or by some such other trick: it is therefore of the utmost importance to the insurer, that this article be pursued to the greatest rigour, and it may be seen in the ordinance, *Number VII. art. 2.* that these sorts of cases are reserved to be judged by the lords *Echevins* (or sheriffs.)

32d Article, "Ordains, that all accidents of insurance, shall be brought in the first instance before the commissioners of the chamber, which they shall judge upon the footing of the ordinance; and for their employ, they shall have jointly with the secretary one-third *per cent.* on the sums brought for their determination, payable by the plaintiff."

33d Article, "Authorizes the commissioners of the chamber, to order a delivery of the money demanded, wholly, or partly, if they think proper, after the verification of the policies and proofs; and that it appears to them, that the notification of the loss to the insurers was made three months before, permitting those who have obtained the possession, to remain with the money, under a sufficient security, to return it with interest, after the rate of twelve *per cent. per ann.* if the commissioners find afterwards that it ought to be returned."

34th Article, "Permits an appeal from the sentence of the commissioners, to the *Echevins* (or sheriffs) of the city."

35th Article, "Ordains, that the execution of the sentences given by the commissioners, shall be performed in the same manner, as that of the sentences given by the *Seigneurs Echevins*."

36th, and last Article of the ordinance, Number I. "Directs those who appeal to the *Seigneurs Echevins*, from the sentence of the commissioners, to do it in ten days, and to give in their articles in ten days after; paying at the first audience twelve guilders as a mulct, if the sentence of the commissioners is confirmed by the said *Seigneurs*."

Remark. I shall content myself with giving the sense of these four last articles just as they are, without entering into a detail of the cases that may happen, when obliged to litigate them with the insurers; because that there is an infinity, which almost all differ one from another, in the whole or in part, and which the solicitors, who plead these sort of affairs often, know so well how to embroil, that the process may last longer than it ought; I shall only remark on this subject a passage in the *treatise on Averages*, wrote by the famous *Quintyn Wytfen*, which is very often cited in justice, upon the matter of averages and insurances, where he says, *that the insurer is regarded by all as a pupil*, that is to say, that they are protected in justice as orphans, and that they are never condemned to the utmost rigour, as it may be done in a cause between particulars; and it is for this same reason, that I advise all those, who have any difference with the insurers, to accommodate or compromise it amicably, as well as they can, and avoid a suit, as they may be certain they will often get more by a friendly adjustment than by a litigation; for the insurers had rather grant something than be prosecuted, because this makes them decried as wranglers; but it must at the same time be confessed, that if too much is demanded of them under this belief, they rather choose to go to law, in which they are not quite wrong.

And as in process of time some new causes have happened, not mentioned in the ordinance, the magistrates of this city have, from time to time, made additions and ampli-

fications, and changed those articles which they found not to be essential. The additions are contained in the eleven regulations or ordinances following, which I shall mark from *Number II.* to *XII.* to follow the order in which they are couched, *in the manner of proceeding before the justice of Amsterdam*, from whence I have taken them.

NUMBER II.

The 30th of January, 1626, "The lords justices willing to amplify the second article of the preceding ordinance, have ordained, that when any one is insured, and the insurer fails and becomes insolvent, the assured may set aside the insurance, by his notifying it to him, by a notary and two witnesses, at the place of his last habitation or to his assignee, leaving however the premium, which he cannot reclaim, and afterwards he may get himself insured by another underwriter, on good and bad advices."

This amplification was undoubtedly made to prevent the difficulties which might result from what the article 2, (where it is spoken of) ordains, that the assured shall run the risk of $\frac{1}{10}$ for all under 12000 guilders; according to which, a man, who has got 10800 guilders insured on goods worth 12000, cannot insure any more; and one of the insurers happening to fail, and the assured being desirous to get some other to underwrite in his room, it would seem by the policy, that he should have got himself insured for more than he was permitted, if he had not given it over, in the forms directed in this amplification, which may serve him for proof in case of need; but as I have mentioned under the second article, that any one might get himself insured entirely, I shall only observe here, that if an insurer happens to fail, the assured should by no means omit desisting from his insurance, in the forms prescribed by this amplification.

NUMBER III.

The 9th of May, 1614, "Our lords of justice having examined the 17th article of this ordinance, and found that great abuses had resulted from it, they thought proper to alter it; and to ordain, that hereafter, all sorts of merchandizes and effects whatsoever, shall be comprehended under the general names of merchandize or effects, corruptible or incorruptible; but that he that would insure upon gold, silver, coined or uncoined, precious-stones, or jewels, and ammunition, shall be obliged to have it expressed in the policy, on penalty of its being nullified."

The 17th article above-mentioned, orders to specify in the policy, the merchandizes which are subject to perish through their own nature, which was quite needless; because the 27th article of the same ordinance, exempts the insurers from paying the damage which shall happen without any foreign cause; and whether these sorts of merchandize are named in the policy or not, when any damage happens, the question is, to know what cause produced it; but in regard of gold, silver, jewels, and warlike stores, the 17th article remains in its full force.

NUMBER IV.

In February, 1600, and in the month of June, 1601. "Our lords of justice ordered, that the commissioners of the chamber of insurances, and their secretary, might be insured."

The 30th article of the first ordinance had prohibited it, as may be seen in the said article.

NUMBER V.

"This ordinance provides, that all the different accidents which arise from averages, shall be carried in the first instance before the commissioners of the chamber of insurances, to be by them regulated and decided, in the manner established with respect to insurances, in the last articles of the first ordinance, and that the execution of the sentences shall be performed according thereto."

NUMBER VI.

"The first of this ordinance, provides, that they shall every three days proceed against those, who being cited before the chamber, shall not appear; and that for the first, second, third, and fourth fault of non-appearance, they

they shall be condemned on the second omission, in a mulct of six stivers; on the third, in twelve stivers; and at the fourth eighteen stivers; and that the commissioners may condemn or absolve for the principal at the fourth neglect, however, without decreeing a security in virtue of the said faults, unless the commissioners see by the deduction of the cause, that it is disposed so that he ought to be ordained to give it, instead of a definitive sentence, in virtue of the fourth fault.

“ The second part ordains, that the decay or ruin of the ships that go from hence to the Indies, whether it happens going or coming, shall be on account of the insurers, unless these vessels happen to be employed in an extraordinary manner in the said Indies, for the trade thereof; and that all the merchants shall be obliged to place their merchandize, upon which the average ought to be regulated, according to their true value; and that this may be done with the greater honesty, the effects, brought under contribution, shall be put into the hands of the commissioners, to the end that they may be enabled to determine equitably.”

This ordinance was made the 20th of June, 1600, before the establishment of the India company, and regards more the particulars who traded there, than the company, who never insure, that I know of; but since that it charges the insurers with the perishing of ships in a country so distant, there is a much stronger reason that they should be answerable for the same misfortunes in those seas, which are a great deal nearer, in which the insurers would certainly be greatly to be pitied, if the commissioners had not some regard to them, which is left to their discretion in the ordinance, *Number XI.*

To commit the effects under contribution of an average, into the commissioners hands, that they may judge equitably, is very often impossible, and when it is otherwise, the thing would be equally troublesome to the commissioners and merchants; therefore in such cases, the commissioners themselves have the ships taxed that lie before the city, and order the merchants, who have an interest in the loading, to bring in an account of the just value of their goods to the chamber, and as this is often done after the goods are sold, those who have disposed of theirs, insert the produce in their account, and those that are still unfold, they pass according to the price current; and upon the taxation of the ship, these different accounts of the merchants, and the estimation of the damage happened, the commissioners regulate the average, and decree the repartition in their sentence.

NUMBER VII.

This ordinance, made the 14th of June, 1607, contains five articles; of which the

1st Article ordains, “ That the fines proceeding from the faults obtained before the chamber, shall be exacted by the huissier of the chamber, of which he shall have the third for his trouble; and if he cannot recover them, they may be exacted by the sergeant of *Monsieur* the officer.”

2d Article, “ Directs the commissioners to send before the lords *Echevins* all those causes of insurance in which they have found any fraud.” This is properly a confirmation and amplification of that which is said in the first ordinance, article 31.

3d Article decrees, “ That when in any danger, some gross goods shall have been thrown overboard from between decks on ships coming from the Levant, they shall be brought into an average, on ship and cargo.”

This is a law generally received by all Europe, to bring into a gross average all that is thrown into the sea, all that is cut away, broken, or lost in the danger, to save that which remains aboard; which makes me believe, that this article was only made to stop the mouths of some wranglers, who it is probable would maintain, that what is put between decks, being thrown overboard in the danger, ought not to be brought into an average.

4th Article, “ Authorizes the commissioners to condemn the parties, in all or half of the expences, or to decide them as they shall think proper.”

5th Article, “ Enjoins the commissioners not to carry to the insurers account (when they regulate any average) only what they shall find ought to be carried to averages.”

For to understand this article aright, it must be observed, that averages are frequently regulated in one manner between the proprietors of the ship and those interested in the cargo; and in a different one, with regard to the insurers, who are not obliged generally to pay all that is brought into an average upon ship and goods, but only certain articles, according to the circumstance of the case, which would be too long to deduce here.

NUMBER VIII.

This ordinance also contains five articles, of which the 1st Article, “ Decrees, that all the premiums of insurance, which do not exceed 7 per cent. shall be paid in ready money, without deducting them from the damage in these causes, which shall be brought before the chamber, but they shall be counted, and held as paid.”

2d Article ordains, “ That the premium exceeding 7 per cent. shall be paid in six months after signing the policy; but if the premiums on going and coming amount to more than the 7 per cent. and to 14 per cent. inclusive, the half shall be paid down, and the other half in six months after, with the interest of 12 per cent. per annum after the expiration of the said six months, to the time of payment.”

In obedience to the first of these articles, or to both of them, the insurers never sign a policy, that they do not insert at the same time, that they have received the premium, although they do not receive it till two or three months after, and some time, never, because they have an open account with every broker; and if a loss happens, they draw upon him, without having enjoyed the premium. It is true, that they may recover of him directly, and it were to be wished for their sakes, that they gave less credit to some brokers, who use the premiums to pay every thing else but them; if they gave so much less credit to the brokers, the insurers would not suffer as they often do, when any one of the former becomes insolvent; for if the merchants, by employing the brokers, give them an opportunity of gaining their brokerage, they only are answerable to the insurers for the premiums; and if those were paid in ready money, the brokers would not be exposed to this risk.

In regard of the premiums in going and coming, the custom observed for a long time, has been in the same manner as above, but the broker will not engage with the insurers only for the premium out; and when the ship is arrived, or is upon her way home, the insurer assigns the premium of her return to the assured; but as it frequently happens, that some of the assured fail during the interval of the voyage, by which the underwriters lose the premium on the ship's return; it is now some years since they have obliged the brokers to be answerable for both, in which I think they have acted very prudently.

3d Article, “ Ordains, that when the chamber of assurances has made a repartition of the average or damage, the insurers shall be obliged to pay it directly, and in default thereof, they shall pay the assured an interest on the sum in which they have been condemned after the rate of 12 per cent. per ann. to be reckoned from the day the repartition is made, till the time of its discharge.”

This case occurs so rarely, that I have never seen an example of it; but on the contrary, a loss or an average is no sooner regulated by the chamber, than the insurers are the first who desire to pay, unless they think themselves unjustly dealt by, and have an intent to appeal.

4th Article, “ Directs the commissioners not to make any repartition of total losses, till the three months of the abandoning be expired, according the 25th article of the first ordinance.”

I have remarked upon the said 25th article, that in such case the insurers ought to pay the entire loss; but on agreeing to it amicably, they only pay 98 per cent. which is better to both the one and the other, than to go to law, for many reasons.

5th Article, “ Orders, that the brokerage on insurance shall not exceed $\frac{1}{4}$ per cent. as well on going and coming, as on going, or coming only; to be paid, half by the insurers, and the other half by the assured.”

The custom is, that the insurers only pay the brokerage at $\frac{1}{4}$ either going or coming, and $\frac{1}{2}$ per cent. outwards and homewards: and if this is not agreed to, as the brokerage for

for going or coming singly is $\frac{1}{4}$ per cent. the brokers may with reason, first make the insurance outwards, and some days after, make that homeward, in order to get double brokerage; and I do not doubt of their having done so, since the making this ordinance, &c.

NUMBER IX.

It is ordained by this amplification of the preceding ordinance, *Number VIII.* "That all the premiums of insurance, at whatever per cent. they may be, and let them be what they will, shall be paid immediately on signing the policy, under the penalty of their being null; provided that those which are made for going and coming, the premiums for going shall be paid directly, and the premiums for returning shall be paid on the arrival of the vessel; and of all the insurances which are made by the month, the premiums shall be paid down for as many months as shall be stipulated in the policy."

NUMBER X.

As the foregoing ordinance does not very clearly explain itself, in saying, that the premiums on the homeward bound voyage shall be paid on the ship's arrival, this article is added, and imports, that the premiums on her coming back, shall be paid when the vessel shall be returned, and finished the voyage.

It may be seen by these two articles, what I have said under the second article of *Number VIII.*

NUMBER XI.

In reply to the advice which the commissioners of the chamber requested of the burgo-master, how they should regulate the damage upon woad, sugar, and other merchandizes, which come from the Azores islands; as a very great difference is found in the price, between those bought with ready money, and those taken in truck; and also upon what the said commissioners represent, that in long voyages, where the assured gain largely, the vessels decay considerably, and if they are lost, the insurers pay a great deal more than the ships would have sold for if they had arrived in safety.

"Our lords of justice ordained, that the woad should be reckoned, till farther order, upon the footing of 800 rees the quintal, unless the concerned can prove in eight months, that the woad was bought in the said isles, at a higher, or lower price; and with respect to sugars and other merchandize, the commissioners may value them as they shall think proper."

"And touching the ships, which by the length of their voyages, are worn out, worm-eaten, or become unnavigable, the commissioners were authorized to act according to their discretion."

It is very just to have regard to the price of the goods which are to contribute to an average, when the calculation is to be made, more especially when some part of them have been taken in truck, and the other paid for in ready-money; in which case, those that are received in truck, would cost a good deal more if passed at the price they were taken at in barter, than those purchased with ready-money, and would not however be any thing better; and notwithstanding they would pay considerably more than they ought towards the average. For example, a quintal of woad shall have been taken in truck for 1200 rees, and a quintal of the same bought for 600, with ready-money; and if the average is regulated on the footing of these two purchases, the quintal taken in truck will pay double the average that the quintal bought with ready-money will, which would be visibly contrary to reason, and to the ordinance, *Number VI.* which directs, that things should be put at their true value.

In respect of the decay of ships, it is certainly very equitable, that it should be regulated, as well in the regulation of losses, as in that of averages; for it is certain, that on many occasions the insurers lose, and pay the damage which happens to ships, whilst the proprietors gain a great deal above it.

NUMBER XII.

This amplification decrees, "That henceforward, any abandon, registering, or authorization, in matters of insurance, shall not be done but by the secretary or huissier of the chamber of insurances, who are sufficiently authorized for it by this ordinance, which prohibits all notaries, brokers, and other persons, to undertake the doing any act, under penalty of its being null."

If the assured judge that the insurers have any room to make a dispute, they ought not to fail making the abandon, registering, or authorization, as it is ordered here above; because all that they get done by their brokers is null and invalid, if the affair comes before the chamber, and that these pieces must absolutely be drawn up there, and signed by the huissier, to be valid.

The 5th of March, 1688, the following ordinance was published:

"Those who would get insurance made on ships or effects already departed from the place of their loading, shall be obliged to declare it on the policy, and to note the time of their departure, except they are ignorant of it; and if they are so, they are expressly to declare it in the policies, on penalty of its being null."

As this article has a relation to, or affinity with the *Articles 6, 20, or 21,* of the first ordinance, it may be seen what I have said under the 6th.

The same day, 5th of March, 1688, the subsequent order was also published.

The lords justices having been advised, as well by many merchants, as insurers, that divers changes were daily made in the print of policies, and that almost every broker added some novelty, which obliged both the merchants and insurers to read, as well what was printed, as wrote in them; and that this was a troublesome practice, by reason of the many affairs they had to transact at the *Bourse* and elsewhere; from whence proceeded a greater number of frauds, bad tricks, &c. the which my said lords desire, and to prevent, have enacted and ordained, that henceforward no one shall print or offer any policy which does not contain word for word the same as those that follow, and they must be marked by the secretary of the chamber of insurances, who shall have three stivers as his due for each; and no policy shall be made which is not marked by him, in want of which, they shall be invalid; and the brokers who offer any policies, with other contents than what is in the subsequent forms, shall pay for each fifty guilders mulct.

A form of the licensed policies upon ships.

We the underwriters do assure you, Mr. _____ or any other to whom it may appertain, in the whole, or in part, friend or enemy, without any exception, viz. every one for the sum here subscribed, of (in this blank is inserted the voyage the ship is to make)

upon _____ the body and tackle of the ship (which God preserve) with her guns, ammunition, apparel, and appurtenances belonging to the said _____ or to any other, called _____ of which is captain _____ or any other who may be put in his place the risque, perils, and adventures which we take upon us, from the day and hour that _____ until the time that the said ship shall

be arrived as above, with her guns, ammunition, apparel, and appurtenances, and entirely unloaden; and the said ship may go forward, retreat, turn, and go about to the right, left, and on every side, in the manner that the captain or captains may think proper, for the benefit and advantage of the said voyage; the above-mentioned dangers, consisting in all perils of the sea, of storms, fire, and winds, arrest of friends or enemies, detention of kings, queens, princes, lords, and communities, letters of marque and counter-marque, imprudence of captains, or barretty of the mariners; and in all other perils and adventures which can happen to the said ship, of whatsoever sorts they be, foreseen or unforeseen, ordinary or extraordinary, without excepting any one, provided they happen without any design or knowledge of the assured;

assured; we put ourselves in all the aforesaid cases in your case, to pay you, the assured, or to your agent, all the damages that you shall have suffered, viz. each one, in proportion to the sum he shall have underwrote, as well the first as the last insurer, and that within one month after we shall have been duly advised of the loss or damage, and in that case, we give to you the assured, and to all others, a full power, whether it turns to our advantage or to our loss, to lend a hand to save the said ship, and its appurtenances, to sell it, and to distribute the money, if the case requires it, without demanding either our consent or permission: we also paying the charges, which shall be occasioned in this affair, and likewise the damage which shall have happened, whether any thing is saved or not; and in respect of the account of charges, a certificate shall be added to the oath of him that furnished them, without any contradiction; provided that there shall be paid us in ready-money for the price of this assurance

per cent. engaging for this effect, and submitting our persons and goods present, and to come, according to law, renouncing, as men of honour, all chicanes and exceptions, which may contradict the present. So done at *Amsterdam*, &c.

N. B. The policies on goods are the same with the above, only varying the terms (as in the English one) therefore I omit the translation.

A new amplification of the ordinance of the chamber of assurances, and averages of the city of Amsterdam.

The lords of justice of the city of *Amsterdam*, having seen and examined the request of many considerable merchants of the said city, presented to them to-day, beseeching that there may be some alteration and redress made in matter of insurances; and after having heard the advice of the commissioners of the chamber of insurances and averages, have thought proper to enact and ordain, as they do by these presents:

1st Article, "That henceforward insurance may be made on the body and tackle of ships for seven-eighths of their true value, however, without permission to make any on their freight, powder, ball, victuals, or such like things which are consumed, and the assured shall be obliged to run the risque of the one-eighth, as well for what is above, as under two thousand *livres de gros*, derogating and altering in this respect the 10th article of the ordinance of the chamber of insurances."

The 10th article of the first ordinance altered by this, forbids the insuring ships for above two-thirds of their value, which was sufficient to discourage all those who should have a design to build ships, it obliging them to run the risque of one-third of their value, which might not suit every one; so that it is with reason they have changed the said 10th article, of which we are speaking; and it is even very much wished, that they had not obliged the owners of ships by this article, to run the risque of the one-eighth; for besides its causing many disputes, there is not naturally any necessity to oblige a man to run a risque, which an insurer would take on him for the premium he receives; there is even (if I may be permitted to say so) a wide door opened to chicanery in this amplification, which only speaks of the body of the ship, without making mention of the apparel and appurtenances, which are very often worth as much as the body of the ship; I, however, very well know, that when the commissioners of the chamber have a ship taxed, it is taxed with all its apparel and appurtenances, and without contradiction from the insurers; but I do not know what would happen if some one amongst them would stick to the letter of the ordinance, which only gives commission to insure the body: it may be said that a ship cannot go to sea without sails, masts, &c. so that her apparel and appurtenances being absolutely necessary to perform the voyage, they may be, and effectually are, comprehended with the body of the ship; however, this would not shut the mouths of some wranglers, if they were in such a case. But not to extend my criticism any farther, I shall say, that when an insurance is made on the body of a ship, it is very necessary to value it in the policy, and to insert that it is with

all its appurtenances and dependencies, and such other clauses, as an expert broker should find a propos to put in, according to the case and circumstances.

2d Article of this amplification says, "That in like manner it shall be permitted to insure the simple ransom, or redemption of captains and sailors, who run a risque of being taken by corsairs, and that upon policies (of which the plan shall be given herewith) the which ought to be marked by the secretary of the chamber, who shall have three stivers for each, as for other policies, upon penalty, that if they are not marked by the said secretary, they shall not be valid; and that the brokers, who shall make any policies in a different manner, shall pay fifty guilders mulct for each, &c."

The *24th article* of the first ordinance, prohibits the making insurance on any lives whatsoever; and many people confound liberty with life, imagining, that insuring the one, was not more lawful than the other, which occasions many difficulties between the owners of ships, and their captains, bound to the Mediterranean and the adjacent parts, where they run the risque of being taken by the Turks, when at war with them, and it was undoubtedly for that, that this article was made; and on the least rupture that we now have with any one of the states of Barbary, the captains designed for the Mediterranean, will by no means fail, 'till their owners have insured three or 4000 guilders upon their liberty, in order to redeem them with this money, in case they are so unfortunate as to be taken.

3d Article of the said amplification, "Decreets, that any insurance made upon money given *a la grosse* (a term used in Holland for lending money at a large interest like bottomry) upon goods, shall not be valid, unless it be expressly mentioned by all the bills of lading of the goods, how the money was taken up, with the date of the day and the place, from whom it was taken, and to whom it was delivered, and for whose account; but the assurance being made from a place, where no bill of lading was signed, it must be proved by the contract *de grosse*, or bottomry, &c."

The *4th and 5th Articles*, authorize the commissioners to condemn, from the second non-appearance, those whom the insurers have cited before the chamber for the payment of premium, and to proceed to other causes every second day, and to condemn upon the third default.

The Form of a Policy of Insurance upon the Liberty of a Person.

We the underwriters insure you or to whom it may appertain, viz. each for the sum here undersigned, to _____ on condition to go every way, during the whole voyage, and with liberty to touch in all places and in all countries in the way; to advance, retreat, get into port, unload and load, at the will of the captain or mate, whether it is with the liking and consent of the assured or his deputy or not; and that upon the body and person of _____ bound for _____ upon the ship (which God preserve) called _____ commanded by captain _____ and in case that the said ship should happen to be lost, and not accomplish her voyage, we run the same risque on the ship or ships upon which the said _____ may embark, to pursue and finish his aforesaid voyage, be it either by sea or land; and we only run the risque of his being taken by any nation whatsoever, whether Turk, Moor, Barbarian, or other infidel pirates, from whom, in case that the said _____ happens to be taken, and ransomed (which God avert) we promise to pay immediately to the assured, or to the bearer of these presents, without any abatement, each the sum by us insured for his redemption, with the other charges that this affair may occasion; and that as soon as the advice shall be received, and that it shall appear to us that he is released, or his ransom paid, and that the bills of exchange have been accepted; but the sums by us insured must be employed only in his ransom and concurrent expences, and for nothing else; and for the accomplishment of the above, we engage our persons and effects, present and to come, submitting them to all laws and tribunals of _____ justice,

justice, the whole sincerely without fraud or deceit; and we have agreed for the premium. So done in *Amsterdam*, &c. See ASSURANCE.

AMULET, an external medicine, or charm, worn in some part of the body, to cure or prevent diseases.

As we learn from sacred history that idolatry had diffused its baleful influence over the minds of men long before the days of Moses, so it is probable, that magic, and the ridiculous attempts to prevent diseases, and restore health, by the use of charms and amulets, are as old, since they seem to be closely connected, and nearly allied to each other. As this is the case, it must be as difficult to trace the origin of magic and amulets, as of idolatry itself. But it will be sufficient for us to know, that these illicit methods of procuring health, which were founded on a false religion, and supported by the credulity of a giddy and unthinking multitude, were not only practised, but in a manner incorporated with physic, long before the Greek physician *Æsculapius*, who, in all probability, practised them himself.

As to the manner in which this abuse crept into physic, and the motives which have induced mankind to prostitute their understandings, and affront their reasons, so far as to give it countenance, it is probable, that men, seeing the natural means of preserving health, and preventing death, frequently unsuccessful, grasped at every thing that first presented itself, and believed the impostor, who had confidence and wickedness enough to impose upon them. They allowed themselves to be so much the more easily decoyed in this particular, because they imagined, that, though these superstitious practices should happen to do no good, yet at least they could not possibly do any harm; and though they were of themselves without virtue, and without efficacy, yet, to authorize and establish their use, it was sufficient that some persons believed, that they reaped advantage, and received ease from them. It is even possible, that the belief, afforded by these charms, might have been real, since the force of imagination in the patient might have supplied the defect of medicinal virtue in the amulet; and the impression, made upon the mind by it, might have communicated itself to the body, and changed the state and condition of its parts. If to what has been said we join these two considerations; that these amulets were not, like other remedies, ungrateful and painful; and that religion, or rather superstition, which has too great an influence over all mankind, joined her sacred sanction, and pronounced them lawful: I say, if we reflect upon these things, we shall not be surprized, that men fell into the mistake, embraced the agreeable delusive error, and justified their prostitution of sense and reason, by an allegation of imaginary good effects produced by them.

But, whatever the cause be, certain it is, that charms and incantations have been so effectually introduced into physic, that all nations in the world have used them time out of mind.

The Pagans are not the only people who have fallen into this folly. Those who have been honoured with the knowledge of God, have suffered themselves to be corrupted and carried off by the bad example of their idolatrous neighbours; and some even of those who have been accounted the wisest of men, whatever the religion they professed was, have been so weak and superstitious as to split upon this rock, as well as the vulgar; though there have been in all ages, even among the Pagans, some free unfettered souls, who nobly dared to think for themselves, who looked through the mask, and sneered at the wild delusion.

AMURCA, in pharmacy, the feces which subside to the bottom of the vessel, where oil of olives newly expressed is put.

Lemery says, that it is emollient, lenitive, and resolutive, and proper to ease pains of the head, being outwardly applied, and to stop fluxions.

AMYGDALATUM, an artificial milk made of almonds, usually called an emulsion.

ANA, in physic, a Greek preposition much used in prescriptions, to signify equal parts in the ingredients preceding it. See it explained under the article A.

ANACARDIUM. *Lin. Gen. Plant.* 467. *Acajou. Tourn. Inst. R. H.* 658, *Tab.* 453. The cashew nut, or *acajou*. In the shops *anacardium occidentale*, which led Dr. Linnæus to apply the title of *anacardium* to the genus, rather than continue the former appellation of *acajou*, which was the Indian name, but it is doubtful if the eastern *anacardium* is of the same genus with this:

We have but one species of this genus, viz.

Anacardium, Hort. Cliff. 161. the *occidental anacardium*.

This grows to the height of fifteen feet, or more, in its native country, which is both Indies, but in England the plants are with great difficulty preserved; though by their first shoot from the seeds, they appear so strong and vigorous, as to promise a much greater progress, than they are ever seen to make.

The pulpy fruit, to whose apex this nut grows, is as large as an orange, and is full of an acid juice, which is frequently mixed in the making of punch in America. Many of these fruit have been brought to England, in casks of rum for the same purpose.

The nut is of the size and shape of a hare's kidney, but is much larger at the end which is next the fruit, than at the other. The outer shell is of an ash-colour, and very smooth; under this is another which covers the kernel, between these there is a thick black inflammable oil, which is very caustic; this will raise blisters on the skin, and has often been very troublesome to those who have incautiously put the nuts into their mouths to break the shell.

The milky juice of this tree will stain linen of a deep black, which cannot be washed out again; but whether this has the same property with that of the eastern *anacardium*, has not yet been fully experimented; for the inspissated juice of that tree is the best sort of lac, which is used for staining of black in china and japan.

Dr. Grew mentions the juice being used for staining of cottons, but it is doubtful which of the species he means; though Sir Hans Sloane supposes it to be of the *acajou* here mentioned. However, it may be very well worth the trial, if the inhabitants of the British islands in America would tap a few of these trees in the bleeding season, and collect the juice in earthen pots, keeping it in a place free from dust, or covering the pot over with a linen cloth, to prevent dust from mixing with it; and when it is of a proper consistence some trials may be made with it, to see if it has the same property with the Japan lac; which if it has, may prove a valuable commodity. *Miller. See ACAJOU.*

ANACARDIUM Orientale *Casp. Bauhini*, Malacca bean, is the fruit of a tree, of a black shining colour, about an inch in length, and in shape like a bird's heart, growing in the East-Indies. It is composed of two barks or shells, between which is a fungous substance, containing a dark-coloured caustic oil; and of a kernel of a white colour and sweetish taste. *Lewis.*

ANACOSTE, or **ANASCOTE**, a sort of woollen-diaper stuff, manufactured after the manner of serges of Caen, but not so woolly, and made of better wool. It is made at Leyden, in Holland, at Bruges and Aerschot, in the Austrian Netherlands; at Ypres, and in its neighbourhood in French Flanders. This stuff is a French ell broad, like the serges of Caen, and about twenty ells long. It is generally sent white or black into Spain, where there is a great demand for it. They have lately begun to manufacture some of them in France, especially at Bourges, where they imitate them perfectly well; and the merchants of that city send great quantities of them into Spain.

ANAGALLIS, the name of a plant, of which there are three species commonly used in medicine, the *Mas*, *Femina*, and *Aqualica*. The first is the

ANAGALLIS Terrestris *Mas*, *Offic. Anagallis* *Mas*. *Ger.* 494. *Raii Hist.* li. 1023. *Tourn. Inst.* 142. *Beerh. Ind.* A. 204. Male pimpernel.

This is a small low plant, not above a span high, having a great many square smooth stalks, with small chick-weed-like leaves, set one opposite to another, without foot-stalks, full of small, round, blackish, red spots underneath: the flowers spring from the setting on of the

the leaves, and grow singly on long foot-stalks, being a flower of one leaf, divided into five partitions, of a beautiful scarlet colour. The seed-vessel is round, opening horizontally in the middle, when the seed is ripe, which is small and round, and of a dark brown colour. The root is small and thready, perishing every year. It flowers in May and June, and grows in corn-fields. *Miller*.

The second is the

ANAGALLIS Terrestris Fœmina, Offic. Raii Hist. II. 1024. Tourn. Inst. 144. Boerb. Ind. A. 204. Female pimpernel.

This differs in nothing from the former, but in the colour of its flowers, which in this are blue; and it is more rarely to be met with. *Miller*.

Both these contain a great deal of salt, and a moderate quantity of oil and phlegm.

They are deterfive, vulnerary, and good against malignant distempers. *Lemery*.

The third is the

ANAGALLIS Aquatica, Becabunga, Offic. Raii Hist. I. 852. Tourn. Inst. 145. Boerb. Ind. A. 225. Brook-lime.

The stalks of *brook-lime* are thick, round, and smooth, shooting out fibrous roots at the lower joints, by which it easily propagates itself; the flowers come forth at the joints, growing in long spikes, each flower being made of a single leaf, divided into four roundish segments, and standing on a short foot-stalk, of a fine blue colour, and succeeded by a flattish seed-vessel, full of very small seed. It grows in rivulets, and flowers in June.

Brook-lime is a good deobstruent and antiscorbutic, abounding with volatile parts, and very good for the scurvy. It is also deterfive and cleansing, and useful in obstructions of the kidneys, by gravel or slimy humours; as also for the stone and dropsy.

ANAGROS, a measure for grain, used in some cities of Spain, particularly at Seville. It contains something more than the mine of Paris; so that 46 *anagros* make 19 septiers, measure of Paris; and 19 septiers of corn are reckoned to be equal to about 10½ quarters of London.

ANALYSIS, in *chemistry*, is the resolution of any substance into its first principles, with a view of discovering its component parts.

All the chemical *analyses* of plants which have hitherto been made, with a view to discover their natures more perfectly, have been conducted and managed almost in the same manner; that is, by separating, by means of fire, their constituent and component parts: 20 20

The principal difference which has been observed in separations of this nature, is, that some have fermented the mixed body, before it was subjected to the power of the fire; whereas others have begun the *analysis*, without any previous fermentation. The principles produced or furnished, by both these methods of separation, universally consist of certain quantities of salts, oils, water, and earth.

It has, for very good reasons, been doubted, whether, what we here call principles, are the true and real principles, which constitute and make up the mixt body, before it was subjected to the *analysis*; or, in other words, it has been doubted, whether these four substances, into which the compound body is resolved by the force of fire, were really to be found in that body, when it was in its natural state.

The first reason for our doubting of this is, that two plants differing in taste, in smell, in figure, and in virtues; cabbage, for instance, and deadly night-shade, are, when subjected to an *analysis*, reduced into principles so similar, both with respect to number and quality, that a person would take them for those of one and the same plant analysed at different times; though nothing is more certain, than that the one is a pot-herb, and the other a poison.

The second reason for our doubting of this, is, that one cannot recompose the same compound substance, by rejoining the principles into which it has been resolved by the *analysis*, whatever fermentation they should undergo, or whatever degree of fire should be employed for that purpose.

I pass over other difficulties, since they seem to be of less consequence; but these I have mentioned certainly

merit some attention. As for what regards the first reason of doubt, I shall only observe, that we cannot absolutely deny, that these four substances, salt, water, oil, and earth, enter the composition of all vegetables, since they are universally found in them, after whatever manner the *analysis* is conducted or carried on; but the difficulty only is to know whether they exist after the same manner in the plants, as they do when we have procured their separation by *analysis*; or whether the action of the fire has not altered these principles, and given them a quite different appearance, from what they had in the compound body.

I have made several experiments, in order to satisfy myself with regard to this point; but I shall here only give an account how I have performed one of them, since I intend to draw some consequences from it.

The juice of ripe grapes, newly expressed, put into a vessel, and distilled, will yield first a large quantity of an aqueous liquor, of which, the part that first comes over, is tasteless and insipid; and that which comes last, acid, with some marks of a volatile urinous salt; then, by augmenting the fire, it will yield a small quantity of a very foetid oil; and that which remains in the vessel, being incinerated and lixiviated, yields a lixivial salt, and leaves a small quantity of insipid earth. The same newly expressed juice of grapes being evaporated to about a third, on a very slow fire, and put into a cool place, an essential salt, somewhat acid, crystallized itself in it; and an oily substance, very sweet and agreeable to the taste, floated on its surface; and the liquor that remained was a little tartish, on account of some essential salt, which still remained in it. The same juice of grapes, having fermented, and become wine, yielded in distillation, a pretty large quantity of inflammable spirit, and afterwards a great deal of purely aqueous liquor; then the matter, which remained in the alembic, being evaporated to the consistence of thick honey, I took it off the fire, and poured upon it the strongest spirit of wine, well dephlegmated, which became charged with a reddish oil, of an aromatic smell; a little earthy matter was precipitated, and an acid salt, resembling tartar, crystallized at the bottom. These three different *analyses* of one and the same mixt body, yield us the same principles, but very much altered by the great fire in the first, and by the fermentation in the third *analysis*; so that the principles yielded by the second *analysis*, having neither suffered the torture of a strong fire, nor undergone a fermentation, must, least of all, recede from the natural state which they retained in the plant.

We find the sweetness of the grape in the oily matter which floats above the crystallization, its pbinant taste in the tartish salt which was crystallized, and its fluidity in the aqueous phlegm which was evaporated from it. The earthy matter remained mixed with the oil and salt, and could not be separated but by a strong fire, as happened in the first *analysis*, in which we observe the same things, with regard to the salt of this plant, as in strong distillations we observe of fossil salts, such as salt-petre and vitriol, which we very well know to be acid volatile salts, mixed with a proportional quantity of fixt salt and insipid earth, which serves as a kind of matrix to them. But, as the salts of plants are more compounded than fossil salts, we accordingly find the salt of our plant divided into three different parts; the first is that acid salt which passed through the neck of the retort along with the last parts of the plegm; the second is that volatile urinous salt, which passed partly with the last drops of the acid, partly alone, and partly with the foetid oils; the third is the fixed salt, which is separated from the earthy parts by lixiviation; and these three salts, being naturally joined together in the plant, compose its essential salt, which, as we have seen, crystallized in the second and third *analyses*.

The oil of this fruit, which in the second and third *analyses* is sweet, and of an aromatic smell, is in the first *analysis* considerably changed into a very acid and stinking oil, probably on account of a quantity of urinous and acid salts contained in the plant, which the violence of the fire has carried off at the same time, and mixed with the said oil, which salts, after passing through the neck of the retort, became volatile; whereas the salts yielded

yielded by the other two *analyses* were not so; and as fermentation naturally disengages volatile from fixed substances, we find in the third *analysis* a great deal of burning spirit, which is the most volatile part of the oil of our fruit, and which was separated from it by the least degree of heat.

We see, by the comparison we have made of the principles yielded by one and the same mixt body, in three different *analyses*, that these principles are always found in the same number, but different only in degrees of volatility and fixation, according to the fermentation and degrees of fire these compounded bodies have undergone, during their respective *analyses*. Besides, if to this we add the infinite combinations of more or less of these principles, the difference of which may be imperceptible by us in the *analysis*, we shall not be surprized to find two plants so different in taste, in smell, and in virtues, as the cabbages and deadly nightshade are, so much alike, and similar in their principles.

For these very reasons we may likewise easily comprehend, why one cannot, if I may use the word, recompose a mixt or compound body, by rejoining the principles into which it has been resolved by *analysis*: because the fire having changed their natural situation, and respective degrees of volatility and fixation, and having, even unavoidably, dissipated some part of them, these principles, being again joined together, are neither found in the same quantity, possessed of the same quality, nor arranged in the same manner they were in the compound body, before it was subjected to the *analysis*.

To convince myself further of this truth, I have mixed very simple principles, in order to compose certain bodies, which I afterwards subjected to *analysis*, and which yielded the several principles quite changed from what they were; for instance, the fixed lixivial salt and the expressed oil of plants, mixed together over a fire, compose a soap, which, among other principles, yields, in its *analysis*, an acid liquor, an insipid earth, and an urinous salt, which do not at all appear in the ingredients of which it is composed.

The mixture of an acid mineral, with the essential oil of an aromatic plant, composes a resin perfectly resembling that which flows from certain trees. This composition is only made up of two very volatile ingredients; and yet, upon an *analysis*, it yields all the four principles. It must indeed be owned, that upon the mixture of these two substances, so sudden and violent a fermentation arises, that a flame is often thence produced; and as we know, that in all fermentations, a separation is naturally made of the volatile from the fixed parts, there was no great difficulty in separating the one from the other in the *analysis*, though they did not appear such before the fermentation.

All these considerations and remarks shew us, that those *analyses*, in which only a great fire is employed, are not so proper to discover the principles and virtues of plants, as when, by a moderate heat and fermentation, we promote the separation of their component principles. *Hombert, Mem. de l'Acad. Roy. des Scien. 1701.*

From animal substances we obtain water, earth, a large quantity of volatile, urinous salt, a thick oil, very little fixed salt, and still less acid salt. The same substances, being boiled in water, yield a mucilage, or jelly, from which, by distillation, the principles already mentioned, may easily be obtained. But as most animal substances yield these in much the same manner, and as they appear very little, if at all different, in different animals, nothing can be determined *a priori*, concerning the medicinal virtues of particular animals from their *analysis*.

With regard to the *analysis* of mineral substances, the following experiment will be sufficient: Take two ounces of native cinnabar reduced to fine powder, and mix it with six ounces of quick-lime; put the whole into an earthen retort, distil into a basin of water, and a considerable quantity of running mercury will be found at the bottom thereof. The matter remaining behind in the retort, being boiled in a lixivium of pot-ash, and the solution precipitated with alum, a fine kind of brimstone, called *lac sulphuris*, will be procured; which will sublime into true flowers of brimstone, that may be melted, and run into a roll. This brimstone, being burnt in the

common method, under a glass bell, resolves into an acid liquor, leaving an unflammable, scurfy, terrestrial matter behind; which, being treated as an ore, sometimes affords a small portion of metal, either in iron or copper.

From this instructive experiment, if fully explained, we might derive considerable discoveries. It shews that a true running mercury may lie concealed in metallic ores, or strong earths; for native cinnabar is but an ore of mercury, consisting, as we see, of two different matters, sulphur and quick-silver; which are separable by distillation with quick-lime, or iron filings, and sometimes by long boiling in a strong alkaline lixivium.

We may further observe from the foregoing experiment, that, as common brimstone resolves itself into an acid liquor, and an earthy matter, we find that certain mineral or metallic substances will, by a proper *analysis*, afford the four chemical principles, viz. running mercury, sulphur, salt, and earth. But it is not supposed to hold universally, that all mineral substances should afford a running mercury upon their *analysis*, but only such of them as are properly metallic.

So far as the *analysis* of metals has been carried, it should seem that all metals contain a running mercury, fixed in them, as water is fixed in dry animal or vegetable substances; and joined with a sulphur, or an inflammable part, and an earth; with a little salt in some of them. The fossil salts resolve into a large quantity of acid, which is always united with some sulphur, and a small portion of earth. Most stones resolve into a large proportion of earth, and a small quantity of aqueous and sulphureous vapour. And earths resolve into a mere terrestrial substance, a little aqueous acid, and a small proportion of sulphur.

Upon the whole, therefore, we may conclude, that the five principles, water, earth, salt, sulphur, or oil, and perhaps mercury, are the true chemical principles of vegetable, animal, and mineral substances. We have not here taken notice of air as a chemical principle, notwithstanding it is found in all bodies; because there is no known method of fixing it, so as to render it tangible and corporeal. *Shaw.*

ANANAS, the pine-apple. There are several varieties of this fruit, some of which may have been obtained from seeds; and I doubt not but if the seeds were sown frequently, in the countries where they are in plenty, there may be as great a variety of this fruit, as there is of apples or pears in Europe. And this I have found true by some trials which I have made by sowing of the seeds, which have always produced a variety of sorts from those of the same fruit.

This fruit, (which is justly esteemed for the richness of its flavour, as it surpasses all the known fruits in the world,) is produced from an herbaceous plant, which hath leaves somewhat resembling those of aloe, and are, for the most part, sawed on their edges, but are much thinner, and not so juicy as the aloe: the fruit resembles the cones of the pine tree, from whence it is supposed to have its name.

Where this plant is a native, I believe is hard to determine; but it is probably an indigenous plant in Africa, where, I have been informed, they grow in uncultivated places in great plenty. They have been long cultivated in the hottest islands of the West-Indies, where they are in great plenty, and of extraordinary goodness; but have been many years in the European gardens, so as to procure fruit: the first person who succeeded in this affair, was Monsieur Le Cour of Leyden in Holland, who, after a great many trials, with little or no success, did at length hit upon a proper degree of heat and management, so as to produce fruit, equally as good (though not so large) as those which are produced in the West-Indies, as hath been often affirmed by persons who have lived many years there: and it is to this worthy cultivator of gardening, who did not spare any pains or expence to accomplish it, that all the lovers thereof are obliged, for introducing this king of fruits among them; and it was from him that our gardens in England were first supplied, though we have since had large quantities brought from America. I cannot here avoid taking notice of a common error which prevails amongst many people, which is, that the

the plants brought from America are not so good as those which came from M. Le Cour : but this is a great mistake ; for were the people, who send over these plants from America careful to send the best kinds, there would be found many better than those cultivated by M. Le Cour, who had his from thence at first, as his gardener assured me ; and I have seen as good fruits produced from American plants, as any I have yet seen ; and some three times larger than any I saw in M. Le Cour's garden.

The wine made of the *ananas* is almost equal to malmsey. At the end of three weeks it turns. But, if it be kept as many weeks longer, it becomes better than ever ; but is more heady. The *ananas* supplies also the physician with sovereign remedies. It exhilarates the mind, strengthens the heart and stomach, creates appetite, is good against the gravel and strangury, and is even an admirable antidote against poison.

The water distilled from it has the same properties ; but, as it works quicker, and is also very corrosive, it should not be used but by the prescription of the most prudent physicians.

The flavour of this fruit, when at its maturity, is so sweet, juicy, vinous, and refreshing, that it is eat with great pleasure in hot countries, notwithstanding the want of appetite.

It greatly helps digestion, by reason of its vinous and fermentative quality, which operates efficaciously in the dissolution of our food. It is esteemed, therefore, the best fruit that can be eat at the end of a meal. It strengthens a weak stomach, and creates an appetite. The sick are frequently cured with it, by using it with moderation, and according to the nature of their illness. It is, in a word, the most wholesome of all the fruits of the earth.

It is true, that there is in some sorts of the *ananas* a certain acidity, that is not very perceptible to the taste ; it makes the lips smart, especially of those whose lips are tender, and who are not used to this fruit : and, sometimes, it makes the gums of scorbutic people bleed.

The Javans give it a little green, in slices with sugar, to children, for the worms. To be the more efficacious, it must be a little green ; but in that state it is injurious to women with child. Persons in a fever, or under any inflammation, should avoid it, by reason of the severity of its ferment ; yet it is good to dissipate obstructions in chronic cases. It is very proper also to prevent the generation of the stone in the bladder, and perhaps to dissolve it in time. It is probable, that to the use of this fruit we may ascribe it, that the Indians are scarce ever troubled with the stone or gravel.

This excellent fruit makes part of the refreshment wherewith the Indians, and Africans near the line, entertain the European mariners, and barter it for toys and baubles, which they are fond of. And the Europeans are very glad to have a fruit, whose sight and taste are so very delightful to them, for trifles.

Those plants which shew their fruit early in February, will ripen about June ; some sorts are at least a month or five weeks longer in ripening their fruit than others, from the time of the appearance of the fruit : but the season in which the fruit is in greatest perfection, is from the beginning of May to the end of September ; though in March, April, and October, I have frequently eaten this fruit in pretty good perfection ; but then the plants have been in perfect health, otherwise they seldom are well flavoured.

The method of judging when the fruit is ripe, is by the smell, and from observation ; for as the several sorts differ from each other in the colour of their fruit, that will not be any direction when to cut them : nor should they remain so long as to become soft to the touch before they are cut ; for then they become flat and dead, as they do also when they are cut long before they are eaten : therefore the surest way to have this fruit in perfection, is to cut it the same day it is eaten ; but it must be cut early in the morning, before the sun has heated the fruit, otherwise it will be hot, observing to cut the stalk as long as possible, and lay it in a cool, but dry place, preserving the stalk and crown unto it, until it is eaten.

That sort with green fruit, if suffered to ripen well, is of an olive colour ; but there are some persons who cut them before they are ripe, when they are not fit to be eaten, for no other reason, but to have them green : and although many persons have much recommended this sort for its excellent flavour, yet the sugar-loaf sort is to be preferred to it.

This sugar-loaf sort is easily distinguished from all the other, by its leaves having purple stripes on their inside the whole length. The fruit is of a paler colour than the others when ripe, inclining to a straw-colour. This sort was brought from Brazil to Jamaica, where it is esteemed far beyond the other kind.

The next in goodness to this, is what the inhabitants of the islands in America call the Montserrat Pine ; the leaves of this are of a dark brown, inclining to purple on their inside ; the protuberances of the fruit are larger and flatter than those of the common sort. I raised several plants of this sort from seeds which I received from the island of St. Thomas, where this fruit is in greater perfection than any of the British islands.

As some of this fruit produce a good quantity of seeds in England, when the greater number have no appearance of any, so I doubt not whether there are not some with male, and others with hermaphrodite flowers ; because those fruits which have seeds are remarkably different from the others, when cut through the cells in which the seeds are lodged, lying nearer to the center of the fruit than the above cells, which are chiefly close to the rind ; but not having distinguished this difference till the fruit was cut, I had no opportunity of examining their flowers. *Miller.*

ANASTICA, *Rose of Jerico.* By Morrifon and Tournefort, this is placed under the *genus thlaspi*, or *treacle-mustard*, from which Linnæus separates it, on account of the figure of the seed-vessel, and its valves, which in this is blunt-pointed, bordered, and crowned, and the valves open and oblique to the style.

This plant grows naturally on the sands near the borders of the Red-Sea, and in many parts of Syria. It is a low annual plant, dividing into many irregular woody branches near the root ; at each joint is placed a single, oblong, hoary leaf, and at the same places come out small single flowers of a whitish-green colour, composed of four small leaves, placed in form of a cross, like the other plants of this class. These are succeeded by short wrinkled pods, having four small horns ; these open in two cells, in each of which is lodged a single brown seed.

It hath had the epithet of *rosa Mariæ* given to it by the monks, who have superstitiously supposed that the flowers open on the night that our Saviour was born. But the truth is, that the dry woody plant being set for some time in the water, will dilate and open so as to disclose the seed-vessels and seeds. This I have seen done when the plants have been many years gathered ; so that there are several curious persons who preserve them in their repositories of curiosities, for the singularity of this property.

ANATA, or ANNOTTO, a sort of red dye brought from the West-Indies. It is made of red flowers, which grow on bushes, or shrubs, seven or eight feet high. It is thrown, like indigo, into large tubs, or cisterns, full of water, with this difference, that nothing but the flower is used, the leaves of which are stripped off, as is done with regard to roses. These remain in the water till they are rotten ; and when, by much stirring, they are reduced into a thick liquid substance, it is exposed to the sun to dry, and afterwards made into rolls, or cakes.

There are none but the Spaniards who now cultivate this plant, and prepare the dye in any quantity, the plantations thereof which the English of Jamaica had at St. Angel's being ruined. The English dyers make more account of this drug than of indigo ; and accordingly the merchants of Jamaica, who have it from Porto-Rico, buy it 25 *per cent.* dearer ; for they pay but three rials per pound for indigo, and four for *anata*. The Europeans who trade in this drug have, at present, the greatest part of it from the bay of Honduras.

ANATOCISM. This word is but very little used in trade; however, as it sometimes occurs, it was thought proper to mention it. It signifies the taking of usurious interest for the loans of money. This is when the lender extorts compound interest, or joins and accumulates together the interests of several years, and requires a new interest to be paid for them, as for the first and true principal.

ANATOLIA, or ASIA MINOR, is bounded on the north by the Euxine-Sea; on the north-west by the sea of Marmora; on the west by the Thracian Bosphorus, the Propontis, and Archipelago; on the south by the eastern part of the Mediterranean; and, on the east, by the Euphrates, which divides it from Turcomania and Diarbeck, or Diyarbeckr. It is divided into four parts, viz. I. *Anatolia, properly so called*, on the western. II. *Caramania*, on the southern. III. *Aladulia*, on the eastern; and, IV. *Amasia*, on the northern part. This whole country is naturally rich and fertile, though the Turkish tyranny hath almost reduced it into a desert. The few plains and dales that are cultivated, though after the Turkish method, in a careless, slovenly, and artless manner, do yet yield excellent corn of several sorts, fruits of all kinds, exquisite grapes and wines, the fairest olives, citrons, lemons, oranges, figs, dates, &c. besides abundance of coffee, rhubarb, balsam, opium, galls, and other valuable drugs and gums. To which we may add their twisted cotton, silk, program, yarn, goats-hair, carpets, and tapestries, calicuts, cordovans of several colours, and quilted coverlids, which are brought into Europe from thence.

I. *Anatolia, properly so called*, is divided into the following districts: 1. Bithynia. 2. Mysia. 3. Æolis. 4. Ionia. 5. Caria. 6. Doris. 7. Lydia. 8. Phrygia. 9. Galatia. 10. Paphlagonia.

I. **BITHYNIA**, the nearest province to Turkey in Europe, is parted from it by the small streight, called the Thracian Bosphorus. Prusa, called by the Turks Bursa, still preserves a great share of its ancient opulence; though some say that its traffic is much decayed, and the great concourse of merchants so much lessened, that the place is going to ruin: but this seems to be a mistake, since there is a caravan that goes every two months from thence into Persia; besides its being a stage for several others that go from Aleppo, Constantinople, &c. to Isfahan.

The bethstine is a large edifice, well built, and filled with warehouses and shops, which exhibit to sale all kind of merchandizes, which are brought hither from the Levant, besides those which are manufactured in the city itself. It is well known that the Bithynian silk, which is by far the finest in all Turkey, is, for the most part, manufactured here; besides a great deal which is brought hither from Persia, which, though much inferior in fineness to theirs, is yet wrought in great quantities by the Prusan workmen, who are allowed to be the best in all Turkey for weaving of hangings, tapestry, carpets, &c. which are from thence carried into all parts of Europe, and are there in great request.

Nice, called by the Turks *Isnich* and *Nisbar*, though much fallen from its ancient grandeur, hath a convenient haven on the sea of Marmora, over-against Mesampola. The country about it affords very good fruits, and excellent wines. It contains about 10,000 inhabitants, including Greeks, Armenians, and Jews, as well as Turks, who all drive a considerable commerce in corn, fruit, fine cloth, tapestry, and other Levantine manufactures.

Nicomedia, by the Turks called *Isfina* and *Isfimgimid*, is a large and populous city, with rich and beautiful bazars, or warehouses, markets, halls, and other public edifices. It is situate on a fruitful and delicious hill, the corn, wine, and fruits that grow thereon being reckoned inferior to none in Turkey. It is computed to contain about 30,000 inhabitants, Turks, Jews, Greeks, and Armenians, all driving a considerable traffic in manufactures of silks, cottons, woollen and linnen cloths, earthen ware, and glass of all sorts, which make it one of the most trading cities in these parts. Besides all these, the greatest part of the saics, barques, and other trading vessels belonging not only to this city, but even

to the merchants of Constantinople, are built here.

Chalcedon was once a city of great traffic and opulence; but now is dwindled almost to nothing.

2. **MYSLA and Lesser PHRYGIA**, have the Propontis for their northern boundary: the Hellespont on the west; Phrygia Major on the east; and Lydia and the Archipelago on the south.

The Marmora islands abound with corn, wine, fruits, cotton, and pasture-grounds, whereon are bred great quantities of cattle. Præconessus, the largest of them; is famed for its marble quarries.

Lampascus, now *Lampasco* was formerly celebrated for the excellent wines it produced; and the territory about it is still covered with fine vines and pomegranates, which the Turks cultivate under pretence of preserving the raisins; but, in fact, make good wine and brandy of them.

3. **ÆOLIS** has Phrygia Minor on the north; the Ægean, or Æolian sea on the west; Ionia on the south; and Lydia on the east. Nothing occurs here under the article of trade.

4. **IONIA**, is the next province to Æolis, about the boundaries of which geographers differ. Its only considerable city is the following:

Smyrna, by the Turks called *Ismyr*, is one of the finest ports in the Levant, being situated at the bottom of a bay capable of containing the largest navy in the world; and, by its general and flourishing trade, being one of the greatest and richest cities in the Asiatic Turkey. The commodiousness of its harbour hath rendered it the common rendezvous of the greatest mercantile shipping in all the four parts of the world, and the staple of their merchandize.

It was very considerable in the time of the Romans, and hath been all along famed for its great commerce with all nations, especially the English, many of our considerable merchants residing in it, and having a consul to protect them.

This city is reckoned to contain 15,000 Turks, 10,000 Greeks, near 2000 Jews, besides Armenians, Franks, &c. The Persian caravans pour in their merchandizes all the winter months; that is, from the beginning of November to that of May, consisting, *communibus annis*, of about 2000 bales of silk, besides other cloths of linen, cotton, &c. drugs, gums, &c. From England, France, Italy, and Holland, are imported cochineal, indigo, Brazil-wood, Campeachy-wood, copperas, spices of all sorts, tartar, vitriol, paper, tin, steel, enamel; all sorts of cloths, furs, Delft and Ancona-ware, and a great quantity of other commodities. From thence, in return, is brought Persian silk, mohair, cotton, fine and coarse wool, wax, gall-nuts, rhubarb, opium, scammony, aloes, tutty, galbanum, tacamahac, gum-tragacant, ammoniac, arabic, myrrh, frankincense, zedoar, cassia-munair, &c. besides great variety of tapestry.

The whole traffic is here, as well as in all Turkey, managed by the brokerage of the Jews, the Turks never transacting any bargains with Christians in any case; but leaving it to those subtle brokers, who make a great hand of it, and are all wealthy, and live very handsomely, and some of them splendidly by it. The whole town is a continued bazar, or fair, where nothing that can be wished for is wanting, either for clothing, sustenance, or pleasure; because all the best commodities of Asia and Europe are brought hither, and sold at cheap rates.

The territory about Smyrna is very fertile, with fine olive-trees and vines; and the wine made here is excellent. The consuls of England, France, and Holland, live here in a very stately manner.

5. **CARIA** is bounded on the north by Ionia and the river Mæander: on the east by Great Phrygia and Lydia; and, on the south and west, by the Icarian sea.

6. **DORIS** projects into the sea, and is surrounded by it on all three sides, and is only joined to Caria on the north. It hath the island of Scio, or Cos, and that of Rhodes, on the south and south-west.

7. **LYDIA**, alias *Mæonia*, borders to Phrygia on the east, Mysia on the north, and to Caria on the south; but its limits, strictly speaking, lie between Æolis on the south-west, Mysia on the north-west, Caria on the south, and Phrygia Major on the east. In this province is the river

river Pactolus, famed for its golden sands, and mountain Tmolus, celebrated for its saffron and excellent wines.

The country round *Thyatira*, called by the Turks *Akisher*, is covered with cotton-trees and corn-fields, and a part of it, though uncultivated, with tamarisks. Here are some inferior workmen in the cotton-work, which is the chief manufacture of the place.

Magnesia ad Sipylum, called by the Turks *Surleteffar*, is reduced, from a once large and populous city, to an ordinary trading town, and subsists chiefly on the manufacture of cotton-yarn.

Laodicea, once one of the most considerable trading towns of Asia, especially for the exchange of money, is now nothing but a vast heap of ruins.

Dinghisly is large, and well-peopled, and drives a considerable trade.

8. PHRYGIA Major, has Pamphylia on the south; Mysia on the west; Bithynia on the north; and Galatia on the east. This country would be vastly fruitful, if well cultivated.

Cotyeum, now *Chiutaia*, is a large, populous, and flourishing town.

Synada, was anciently much famed for its fine marble, which was of a beautiful white, spotted with red and purple, and of great price.

9. GALATIA, by the Turks now called *Chiagare*, hath Phrygia Major on the west; Paphlagonia on the north; Pamphylia on the south; and Cappadocia on the east. This country was anciently esteemed a rich, fertile one, and was famed for producing the amethyst stone in great quantities.

Ancyra, called by the Turks *Angouri*, formerly the capital of Galatia, and a noble city, is still a populous, trading place, chiefly in camblets, and such light stuffs.

The city of *Aphion*, or *Apbium*, has its name from the quantities of opium which are made in and about it, the whole territory producing great crops of poppy, from which that excellent drug, called by the Turks *aphion*, is extracted.

10. PAPHLAGONIA, by some made a part of Galatia, together with Pontus, lies on the north of Galatia, and is divided on the east from Cappadocia by the river Halys, and on the west by that of Parthenius. At present it is called, in the Turkish, the country of *Pender*, or *Boli*.

Heraclaea Ponti, now *Penderachi*, or *Eregri*, is quite sunk from its ancient splendor and commerce.

Amastris, now *Amastro*, from being a famed sea-port, under the Roman and Greek empires, is now dwindled to nothing, by reason of the loss of its commerce.

Teuthrania, now *Tripoli*, is still a good port-town.

Sinope, now *Sinabe*, is at present a place of good trade, and maintains a very profitable fishery. The country about it is fertile, if it was well cultivated; witness the many olive-trees of considerable bigness that grow in it. Strabo long since observed, that, in all the coasts from this city quite to Bithynia, there grew great numbers of trees, such as olive, maple, and walnut, with some of which the inhabitants used to build ships; and of others, such as the maple and walnut, they made fine tables, cup-boards, and other utensils. The same is done at present, except that, instead of tables, which the Turks do not use, they make sofas, and other sorts of flooring, wainscoting, and other household ornaments.

Junapolis, now *Cincopolis*, formerly a good trading town, is now quite inconsiderable. See AMASIA, and ALADULIA.

ANATRON, or NATRON, a kind of native salt, extracted from the water of the Nile, by evaporation and crystallization.

This was probably the nitre of the ancients, and is rarely found in Europe. It is a little acrid and alkaline to the taste.

There is also an artificial *anatron*, called *anatron factitium*; it is composed of ten parts of salt-petre, four parts of quick-lime, three parts of common salt, two parts of roach-alum, and two parts of vitriol: dissolve those ingredients in wine, and boil the dissolution; then strain it, and evaporate it to the consistence of a salt. It is used as borax to purify metals, and to put them in fusion. *Lemery*.

ANATRON sometimes signifies the gall of glass, or the spume cast up by the matter of which the glass is made. That scum which appears variegated with divers colours, especially with grey, white, brown, and blue, contains a kind of salt proper to fatten sheep, and which is also given to pigeons. When it is reduced to powder, and left exposed to a moist air, a part of it dissolves, and the remainder that is found coagulated at the bottom of the vessel, differs but little from common salt.

ANCHOR, an essential material belonging to a ship. It is a very large and heavy iron instrument, with a double hook at one end, and a ring at the other, by which it is fastened to a cable. It is cast to the bottom of the sea, or rivers, where taking its hold, it keeps ships and vessels from being drove away by the wind, tide, or currents.

The parts of an anchor are, 1. The ring, to which the cable is fastened. 2. The beam, or shank, which is the longest part of the anchor. 3. The arm, which is that which runs into the ground. 4. The flouke, or fluke, by some called the palm, which is that broad and peaked part, with its barbs, like the head of an arrow, which fastens into the ground. 5. The stock, a piece of wood fastened to the beam near the ring, serving to guide the fluke; so that it may fall right, and fix in the ground.

There are several kinds of *anchors*. 1. The largest is called the *sheet-anchor*, and is never used but in violent storms, to hinder the ship from being drove a shore. 2. The two *bow-anchors*, or bowers, which are less, and are used for ships to ride in a road, or harbour. They are also called the first and second bower, or best and small bower. 3. When a vessel is to be brought up or down a river by the winds, though the tide be contrary to it, the seamen set their fore-fail, fore-top-fail, and mizen-fail, and let her drive with the tide. If she comes too near the shore, they have a little *anchor* ready, which is called the redger, or *redgo-anchor*, with a hawser fastened to it from the ship; and this they drop in the middle of the current, by which means they wind her head about; after which they take up the *anchor* again. 4. The *stream-anchor* is a small *anchor*, made fast to the stream-cable, for a ship to ride by in gentle streams, and in fair weather. 5. The grapnel, is an *anchor* for a small ship or boat.

Merchants, traders, and others, who fit out ships for sea, cannot be too careful with regard to the goodness of *anchors*, since upon them chiefly depends the preservation of ships and cargoes, and even the lives of all those who are on board.

They ought, therefore, to take care that the iron, of which the *anchors* are made, be neither too soft, nor too brittle, both these defects being very dangerous. If the iron be brittle, the *anchor* is apt to break; and if it be too soft, the *anchor* will bend. In order to make *anchors* of a good quality, it is sometimes the practice to conjoin the brittle iron with soft and tough iron; and, for this reason, the Spanish or Swedish iron ought to be preferred, and united together, the former being soft, and the latter brittle.

Aubin, in his Marine Dictionary, observes; that the *anchors* of a large vessel are made smaller in proportion than those of a small vessel. The reason of which, says he, is, that though the sea exerts an equal force against a large ship as against a small one, supposing that they both have an equal extent of wood in the water, which gives room to the water to act equally against an equal extent; yet the small vessel, on account of its lightness, has not the same strength with the great one, to resist the force of the water, which must be supplied by the weight of the *anchor*.

From these, and other hydrostatic principles, which are not necessary to trouble the generality of traders with, the following table has been formed; wherein is shewn, by means of the ship's breadth within, how many feet the beam, or shank, ought to be long, giving it four tenths, or two fifths of the ship's breadth within; by which proportion may be regulated the length of the other parts of the *anchor*. In this table is represented likewise the weight an *anchor* ought to be for a ship from eight feet broad to forty-five, increasing by one foot's breadth.

The inhabitants of the island of Ceylon use large round stones instead of *anchors*. And, in some other places of the Indies, the *anchors* are a kind of wooden machines, loaded with stones. Some pretend that vessels fastened with those sorts of machines keep steadier than those that have iron *anchors*, or only a stone.

ANCHOR is also a measure of brandy, &c. containing ten gallons.

ANCHORAGE, a duty taken of ships for the use of the haven where they cast anchor. *MS. Arth. Trevor. Ar.* The ground in ports and havens belonging to the king, no person can let any anchor fall thereon, without paying therefore to the king's officers. *Covel. ed. 1727.*

It signifies also a duty which masters of merchantmen pay in several ports of France to the king, or the admiral, for the liberty of anchoring in those ports. This duty is not reckoned part of the average; and insurers of ships are not bound to make it good. It is due, and paid by the masters of ships, according to the ordinance of the marine made in the year 1681.

ANCHOR-Smith. The *bolt* and *anchor-smith* requires no great share of ingenuity, and only the common education of a mechanic; viz. reading, writing, and arithmetic. Great strength, however, is absolutely necessary. This is a laborious and profitable branch of the smith's business. The youth may be put apprentice to it for about 10l. and, when out of his time, if he is a good hand, and can bear the fire, may earn a guinea a week and upwards; and in this business a master may set up with 500 l. and employ in it more than 2000 l.

ANCHOVY, the name of a small sea-fish common in the Mediterranean. This fish is about the length and thickness of one's finger; they fish for it in several parts near Genoa and Provence. They generally swim in shoals, and will run towards a fire, when they see it, which is therefore used as a snare to catch them. They are pickled with salt, after their heads are cut off, and guts taken out, and kept in barrels.

The *anchovy* is much used in several parts of Europe, mixed with sauces, for the excellency of its taste; it

helps digestion, and fortifies the stomach with its volatile and saline principles, which cause a gentle and moderate heat in that part, and disperse and attenuate the aliments contained therein. In the mean time, if it be used to excess, it very much rarifies the humours by the principles above-mentioned, and so produces ill effects.

Lemery.

Anchovies should be chosen small, fresh pickled, white on the outside, and red within. They must have a round back; for those that are flat or large, are often nothing but *sardines*. Besides these qualities, the pickle, on opening the pots, or barrels, must be of a good taste, and not have lost its flavour.

ANCHUSA, or ALCANNA, *alkanet*, purple flowered *alkanet*, C. B. *Alcibiadon*. The root only of this plant is used, and there are two kinds of it mentioned by authors: one is brought from the Levant, and the other from Italy and France: the latter is here designed, and therefore shall be alone taken notice of: the former is not known in our shops. The root in use is of a red colour without, and white within, with little blue heads; and being rubbed on the hand, tinges it of a vermillion colour. As the colour, for the sake of which it is used, lies in the bark, the smaller roots are to be preferred: they should be chosen new, clean, dry; yet so pliable as not to be brittle. *Pomet and Lemery.*

The root is astringent, and proper in hæmorrhages of all kinds. Apothecaries use it to colour their ointments, particularly the *unguentum rosatum*; but for this purpose it must be boiled in oil, for it does not readily communicate its tincture to water. *Geoffrey.*

ANKER, a liquid measure, chiefly in use for wine and brandy in France and Holland. The *anker* contains sixteen gallons wine measure.

ANCONA, a marquise in Italy, is bounded on the north and east by the Adriatic sea, and by the Abruzzo and Umbria, and the dutchy of Urbino, on the west. Its soil is fertile, and its chief manufactures are flax and wax, which are whitened here to great perfection.

The city of *Ancona*, standing on the Adriatic shore, over-against Dalmatia, is very conveniently situated for carrying on a traffic into all the countries on the opposite shore. It was anciently very famous for it, and flourishing; but is very much decayed, since Venice has ingrossed all the trade of this sea. However, Pope Clement XII. by a decree, dated February 16, 1732, erecting it into a free port, has endeavoured its recovery. The harbour is a very good one, and, though built by the emperor Trajan, the marble of it looks as fresh as ever. The trade at present chiefly consists in silk stuffs and dressed leather. The Jews are almost the only people that carry on the business here, which greatly enriches them. They have built themselves a very stately synagogue.

There is no money coined in this city; but all foreign coin is received there upon the foot of the Spanish pistole, which is reckoned worth thirty-one julios; the julio, at the rate of seven fols, one denier and one sixth, French money (about three-pence English) the pistole at the rate of eleven livres, and the crown at the rate of sixty fols.

GOLD COIN.

The Spanish pistole	31 julios.
The pistole of Italy	30
The new sequin	19
The old sequin	18
The Hungarian sequin	17

Most of the ships bound for the ports of the Levant take off those last species at *Ancona*, for which they give the bankers, or money-changers, a profit of $\frac{1}{8}$, $\frac{1}{6}$, $\frac{1}{4}$, $\frac{1}{2}$, and even to $\frac{3}{4}$ julio, according to the scarcity of the species they want, or the greater or lesser occasion they have for them.

As to other coins, the evaluation is as follows:

OTHER COIN.

The Roman crown	10 julios.
The julio	10 bayoccos.
The bayocco	4 quadrins.

Of WEIGHTS and MEASURES.

The pound weight at *Ancona* is but 9 ounces and $\frac{3}{4}$ of the Paris pound; so that 100 pounds weight of the former make but 60 of the latter. Their gross weight is a quintal of an 100lb. and makes about 73lb. weight of London.

The length of the *bracciata*, or fathom, is 1 foot 11 inches and 6 lines of the royal foot at Paris; so that 100 fathoms at *Ancona* make about 54 ells of Paris, and 100 ells or auns of Paris make 128 yards $\frac{1}{2}$ of London.

Their measure for linen and woollen is the *bracco*, and is about 27 $\frac{1}{2}$ inches of London.

Their monies and exchanges in general being the same as at Rome, we refer to that general head for an ample account thereof.

The erecting of the port of *Ancona* into a free port, by a decree of pope Clement XII. dated February 16, 1732, extracted from the supplement *au Corps diplomatique du Droit des Gens*, tom. ii. part. 2. art. 154.

By that decree, his holiness abolishes and suppresses all duties, imposts, and taxes, which used to be paid till then in the said port and city, and bestows upon them the following privileges:

1. Commanders and masters of ships, and merchants of all nations, shall freely enter the port of the city with their vessels and effects, to trade and dispose of them there as they shall think fit, either by wholesale or retail, and shall afterwards have liberty to depart from thence in perfect safety.

2. In order to remove all apprehensions merchants might be under of being detained too long, in case any dispute should arise concerning their merchandizes, his holiness consents that the consuls of merchants should take cognizance of the matter, and confirms all the privileges formerly granted to them, to enjoy them after the same manner as the consuls do in the Levant and in Portugal; and for the greater ease of the merchants of the Levant, or of Portugal; and that they may not lose their time or their money before other tribunals, in case they be not satisfied with the sentence of their own consuls, his holiness orders that they shall bring no appeal but to the consularship of merchants, to whose sentence they shall be obliged to submit.

3. The merchants and workmen, who shall settle in the said city, shall be free, during ten years, of all taxes called *bene stante*, (or taxes upon land, as is said in Savary; but it should rather be taxes upon people in good circumstances) and of all duties of importation of foreign wine and oil for their own use and consumption.

4. All ships laden with merchandizes that shall land in the port of *Ancona*, shall have liberty to sell and negotiate them to the best advantage; as also to unload their effects, and lodge them in the common warehouses of the city, and to fend them out of the town by water, without paying any duty or impost, except with regard to grain and *masserizie*, or household goods and furniture from foreign countries, which shall not be imported without a special licence.

5. To prevent all disorders with respect to merchandizes already prohibited, as woollen cloth, silk, brocades, laces of gold, silver, silk, or thread, &c. and others, the importation of which into the state of the church might be prohibited hereafter, his holiness commands that it shall be free to export them out of the said city, and for that purpose a place shall be appointed, where they may be safely kept till the ships be ready to export them out of the dominions of the church, or to such other places where they shall not be prohibited; and, for the said warehouse-room, there shall be paid only five *bayecos* for a cart-load of the said merchandizes, which shall be freely carried out of the harbour, without paying any duty or impost.

6. The lazaretto, or pest-house, of *Ancona*, shall be thoroughly cleaned, and the inspectors of health shall take all possible care of the public security.

7. No person shall perform the office of a broker without being first examined, and procuring a certificate from the consuls, and the number of brokers shall be fixed.

8. For the encouragement of all traders, and pre-

venting all disputes among them, his holiness orders that the effects that shall have been sold, or negotiated, in the free city and port of *Ancona*, shall be immediately subject to the usual and public duties, by paying the small tax above-mentioned, without any alteration; which is to be understood, both with regard to the effects exported by water, and to those imported or exported by land.

9. There shall be people appointed on purpose to pack and unpack the merchandizes, whose salary shall be fixed.

10. The duty of anchorage for all vessels entering the free port of *Ancona* within the following district, namely, from the point *di Falconara*, in a strait line to the rock *della Volpe*, whether those vessels be loaded, or only in ballast, and from what place soever they come, shall be as follows:

	<i>crow.</i>	<i>bayoc.</i>
For small vessels, sailing in the gulph of Venice, of the bulk of 50 migliaia, or 75 rubbia	0	50
For larger vessels, in proportion to their bulk, to 200 migliaia, or 300 rubbia	2	0
For small vessels, sailing without the gulph, of 50 migliaia	1	0
For larger, in proportion, to 200 migliaia	4	0
For all other large vessels sailing both within and without the gulph, namely, ships, patachias, flutes, brigantines, pinks, and other such vessels, of 200 migliaia, or 300 rubbia	5	0
For those of 300 migliaia	10	0
For those of 450 migliaia.	15	0
For all larger ships	20	0

11. The captains or masters shall, on their arrival, declare to the *casto rallo* (or register), or to his clerks, the quality and quantity of the effects they have on board, the persons to whom they are directed, for the sake of preventing all disorders, particularly with regard to prohibited goods.

12. All captains and masters are forbid to unload any ballast, or to throw any dirt in the harbour, under the penalty of 200 crowns; and a place is appointed where ballast may be cast.

13. According to the custom practised in all ports, the vessels which shall lie in that of *Ancona*, shall be obliged to provide themselves with biscuit, salt, flesh, wine, &c. as they shall have occasion for.

The erecting of *Ancona* into a free port, was looked upon with an evil eye by the Venetians; because it draws thither the merchants from the Levant, and from the north, who were used to go to Venice.

The other principal places of trade in the marquise of *Ancona*, are,

The city of *Loretto*, whose whole traffic consists in pilgrims staffs and dresses, crucifixes, images, beads, medals, &c. and is very considerable, on account of the vast confluence of strangers thither.

Recanati is reckoned a good trading city, and has a fair in September, which lasts fifteen days.

The city of *Tolentino*, likewise, is much resorted to by merchants of all sorts, on account of its fairs.

ANCONY, in iron works, signifies a bloom, wrought into the figure of a flat iron bar of about three feet long, with two square rough knobs, one at each end, which are afterwards to be wrought at the chafery.

ANDALUSIA, a province in Spain, is divided on the north from Estremadura and New Castile by the chain of mountains, called Sierra Morena; on the east from Portugal by the river Chauca, and from Algarve by the Guadiana; on the south it hath the ocean, the mouth of the straits of Gibraltar, and part of the Mediterranean; and along the south-east it hath the kingdom of Granada.

No part of Spain exceeds this in wealth and fertility, in commerce from without, and plenty of every thing within themselves; the former is owing to their maritime situation, and commodious harbours; the latter to the richness of their country, and the number of its inhabitants; the surprizing quantities of wheat, wines,

and oil it produces, is almost beyond credibility; and we have been well informed of one single town which hath been known to make 75,000 pipes of wine, and the same quantity of oil in a year. They abound also with numberless cattle throughout the whole province.

It is also needless to mention the so well known exquisite oranges, citrons of Seville, and fine raisins, almonds, figs, pome-granates, &c. that are the natural growth of this province. Here is likewise a great plenty of curious white salt, the best of sugar, fine scarlet berries for dying, and, in a word, every thing that can make a country wealthy and delightful.

They have also rich mines of gold, silver, and rich metals, which have been wholly neglected since the discovery of America. Nor should we omit their most celebrated breed of horses, so famous in all ages and nations; for it is certain, that those of the river Guadalquivir, or the famed Bœtis of the ancients, have always exceeded all other parts of Spain for the finest and fleetest; and the city of Cordova still retains its ancient reputation, for being the best breeder of that noble and useful creature. For SEVILLE, CADIZ, and GIBRALTAR in this province, see them under their respective heads.

Cordova is the next city in dignity to Seville in this province. It stands on a fertile and delicious plain, at the foot of one of the mountains of Sierra Morena, and in a pleasant wholesome air. Besides the extraordinary fruitfulness of its soil round about, which supplies it with plenty of the best wheat, wine, oil, fruits, and every thing that can render it delightful and opulent, it carries on a great variety of trades and manufactures, and particularly the woollen and silken of the finest kind, and in very great perfection; and also that of a curious gilt leather, in great request there, as well as in foreign countries.

But, above all, it is famed for its fine breed of horses, which are reckoned the most fleet and mettlesome, as well as the best disciplined and most warlike in Europe.

Xeres de la Frontera is another city in this province, seated on the banks of the little river Guadaleta, about six miles from the sea, and about fifty fouth from Seville. Its territory is so rich and fruitful, that, besides vast quantities of wheat, fruit, cattle, and provisions of all sorts, it yields annually 60,000 pipes of the wine we call sherry. It has likewise been reckoned to breed in those plains about 2000 horses every year, till of late.

Ezija, or Eijja, seated on the Xenil, a little above where that river falls into the Guadalquivir, and on a fertile and delightful plain, produces immense quantities of corn, wine, oil, silk, and especially cotton and fine horses.

San Lucar is a city and port situate at the mouth of the Guadalquivir, forty-five miles below Seville, and serves as a port to that celebrated city, and is well known throughout Europe; but was much more considerable before the Spanish and West-India fleets were allowed to set out from, and return to, Cadiz.

Lucena is as deliciously seated as any city in Europe, no spot of ground producing greater plenty of generous wine, fine oil, and choice provisions than this territory doth.

These are the chief cities in this province of Spain, which are any thing remarkable for trade: and as the others abound in the like productions, it is needless to mention them.

ANDERAB is the most southern city of all the Great Boucharie, separating the territories of the great mogul and Persia from Tartary; it is by this place, that whatsoever is brought in, or carried out of the country, to or from the states of the former, must necessarily pass: and there is in the neighbourhood of *Anderab* rich *lapis lazuli*, with which the Boucharies carry on a considerable trade, with the merchants of India and Persia.

ANDIRA, or ANGELYN, a tree of Brazil, the wood of which is hard and fit for building. Its bark is of an ash-colour, and its leaves are like those of laurel, but smaller: it produces blackish buds, from which arise a great many blossoms in a cluster, which are odoriferous, and of a fine purple and blue colour. Its fruit is of the size and figure of a hen's egg; it is green at first; but becomes black by degrees, and has a future, or seam, on

one side: it is extremely bitter, and has a very hard shell; and in the inside there is a yellowish seed, or kernel, of a bad taste, something bitter, and astringent.

That kernel, being pulverized, is given for killing worms, but the quantity taken must be less than a scruple; for they say it would be a poison, if too much of it was taken.

The bark, the wood, and the fruit of this tree, are as bitter as aloes; and herein it differs from another *andira*, which is like it in all respects, excepting its taste, which is insipid. The wild beasts eat of its fruit, which makes them grow fat.

ANEE, or ASNEE, a corn measure in France, containing six bushels.

ANEGRAS, a measure for corn used at Seville and Cadiz in Spain. Four *anagras* make a cahis; four cahis make a fanega; and fifty fanegas the last of Amsterdam. See *weights and measures under the articles of Spain and Holland, reduced to the English standard.*

ANEMONE, in botany, a plant, of which there are two species, the cultivated and the wild.

Each of these species is subdivided into several others, but especially the former, which is carefully cultivated in gardens for the beauty of its flowers. The wild *anemone* grows in rising grounds, and mountainous places. Both species of this plant contain a great deal of salt and oil. This plant is deterfive, aperient, inciding, vulnerary, and defficative; but is generally only used externally, in errhines and collyriums, for ulcers of the eyes. *Lemery.*

There are a great variety of these flowers in the gardens of the curious, which have been obtained from seeds: these differ in their colour, and the size of the flowers; and are accordingly distinguished by the florists: but as these are only accidental varieties, arising from the seeds of the same flower, they are not esteemed real differences by botanic writers, who only mention the broad and narrow leaved sorts as two distinct species.

These flowers grow naturally in the islands of the Archipelago, and in several other parts of the East, where the borders of the fields are bedecked with them in the spring, making a very gay appearance during their continuance in beauty. From thence the roots have been transplanted into the gardens in Europe; and from their seeds the great variety, which is at present to be found in the gardens of the curious, as has been observed. These flowers are in beauty in April and May, and the seeds ripen in July.

ANEMOSCOPE, a machine contrived to foretel the changes of the wind.

The *anemoscope* of the ancients, as described by Vitruvius, seems rather an instrument to shew which way the wind actually blows, than to foretel its changes.

Wolffius, in his *Mathem. Lexicon*, speaks of an *anemoscope*, consisting of a little wooden man, which, by its rising and falling in a glass tube, shews the changes of the weather and the alteration in the gravity of the air, which was the invention of Otto Guericke, who made a secret of it, which he would not discover. But at length Mr. Comiers, professor of mathematics at Ambrum, published the secret in the *Acta Eruditorum*, anno 1664; where he observes that the *homunculus* is raised up and down by the rising and falling of the mercury in the barometer.

ANETHUM *Offic. Ger.* 878. *Raii Hist. I.* 415. *Tourn. Inst.* 318. *Boerb. Ind. A.* 65. *Dill.*

This plant, both in root, stalk, and leaf, very much resembles common fennel, except that it seldom grows so tall, or so much branched; it bears yellow umbels of flowers, after which come seeds rounder, broader, and flatter than those of fennel. The whole plant is of a strong scent, less pleasant than fennel. It grows in gardens, and flowers and seeds in July and August. The leaves and seeds are used.

Officinal preparations from *dill* are only the *oleum anethimum*, made by infusion and gentle coction of the leaves and tops in oil. *Miller.*

ANGEL, is the name of an English gold coin; so called from having the figure of an angel impressed upon it.

This piece has been of different values; for in the first of Henry VI. it passed for 6s. 8d. in the first of Henry VIII. for 7s. 6d. in the 34th of Henry VIII. for 8s. and in the sixth of Edward VI. for 10s. At present, it is only an imaginary sum, or money of account, implying 10s.

ANGELICA, in botany, the name of a plant, of which Dale enumerates four species; but that generally used in physic is the

Angelica Offic. Chab. 400. *Ger.* 846. *Raii Hist.* I. 434. *Boerb. Ind.* A. 53. *Angelica.*

This is one of the greatest of the umbelliferous plants; its root is large, thick, and branched, running deep in the earth, from which arises one large, hollow, round stalk, a yard and an half, or two yards high, spreading out into many branches. The leaves are large and winged, divided usually into three partitions, or lesser wings, each single leaf being serrated, or indented about the edges. On the tops of the branches grow large, round umbels, of small five-leaved white flowers; the umbels, as the seed ripens, go out into large globular heads, bearing the seed at the ends, which is large and thick, striated, or furrowed pretty deep, of a whitish colour, two seeds being joined together, as in other umbelliferous plants. Both root, stalks, and seeds, are of a grateful aromatic flavour. It grows in gardens, and flowers and seeds in June and July, the root perishing after the ripening of the seed, which is the second year of its springing from the seed.

Angelica is a plant of many virtues, being stomachic, cordial, alexipharmic; of great use in malignant pestilential fevers, in all contagious distempers, and the plague itself: it causes sweat, and drives out all noxious humours through the pores of the skin. It is very useful in disorders of the womb, and hysteric affections, provokes urine and the catamenia, and expels the secundines. The root, stalks, leaves, and seed are used. *Miller.*

The roots of *angelica* should be chosen whole, thick, long, brown without, and white within: they must not be worm-eaten, which they seldom escape, when kept. Their smell and taste must be agreeable, aromatic, and something bitterish. They contain a great deal of exalted oil and volatile salt. This root is brought dry from several places. Those that come from Bohemia are better than those of England and Holland. Care must be taken, above all, not to be imposed upon by the roots of *maon*, a plant which comes from Burgundy: but the imposition may easily be discovered, for the root of *angelica* is like that of black hellebore, and the root of *maon* like that of common parsley.

ANGELOT, a sort of small cheese, very fat and excellent. It is made in the country of Bray in Normandy, whence it is called *angelot* of Bray. This sort of cheese is commonly presented upon table in little moulds, either square, or in the form of a heart.

ANGLESEY, an island and county in North-Wales, encompassed by the Irish sea on all sides, except on the south-east, towards the continent of Britain, where it is divided from Caernarvonshire, by the narrow strith of Menen, which in some places, at low-water, is fordable, from Beaumaris on the east, to Holyhead on the west.

The soil is more fruitful than could be imagined, it appearing, stony, rocky, or mountainous. Giraldus extolled it for the most fruitful country for wheat in all Wales, inasmuch that, in his time, it was proverbially called the mother or nurse of Wales, by reason, when other countries failed, this had such plentiful harvests, that it used to supply all Wales.

It is at this time generally very rich in corn, particularly in wheat, said to be the best in Wales, as also in cattle, fish, and fowl: it produces likewise great plenty of mill-stones and grind-stones, and some allum.

1. *Beaumaris* is the chief town, and has a good harbour for shipping; their market is well supplied with provisions, and it is the usual town for the reception of passengers from London to Ireland, before they take shipping for Holyhead.

2. *Holyhead*, is the station for the packet-boat to Ireland; it lies opposite to Dublin, to which it is the shortest and the safest passage over St. George's Channel. The packet-boats from Dublin arrive here three times a week,

if the wind permits, and are larger than those to Holland and France, as they ought to be, considering that St. George's Channel is so boisterous, especially in the winter.

ANGOLA. See AFRICAN Coasts.

ANGORA, or ANGOURI, capital of Galatia, has always preserved its reputation for the beauty and fineness of its goats hair, and the fabric of stuffs made there at present, called camblets; and it is from this place, and *Beibazar*, that Smyrna is supplied with these commodities, the quantity of the former being almost incredible, of which it is said the English transport above five hundred bales, the French as many, and the Dutch more than double that number; and the consumption of it is full as great there, as what is shipped by these nations: the English and Dutch have factors settled here to purchase this commodity at first hand, by which means they have it much cheaper than when brought to Smyrna.

ANGOUMOIS, a province of France, is bounded by Poitou on the north, Limosin and La Marche on the east, Perigord on the south, and Saintonge on the west.

This province produces abundance of corn, wine, and excellent fruit. The fruit and corn which grow here most plentifully, are wheat, rye, barley, oats, another sort of grain, which the French call *baillorge*, pretty much like barley, Spanish wheat, saffron, wine, and walnuts.

Wines are the chief and most important branch of the trade of *Angoumois*. The wines in the greatest repute, and sold preferably to all others, are those of Cogniac and its district, and the next in quality are those of Angoulesme.

The red wines are sold in Limosin and Poitou, and the white wines serve to make brandy.

The sale of brandies differs according to the times. During the wars, they are bought up by the French commissioners of the stores, for the use of the armies in Flanders and Germany. They are first carried by land to Châtelleraud, where they are embarked on the Vienne, to go afterwards by the Loire to Orleans, from whence they are sent to the places for which they are designed.

In time of peace, the sale is easier, quicker, and in greater quantity. They are then sent to Charante, below Rochfort, where the English and Danish ships come and take off great quantities, especially of the Cogniac brandies. At Charante is a duty to be paid, which is thought to do some prejudice to the trade.

ANGOULESME, the capital city of Angoumois, stands on a high hill, at the foot of which runs the Charante; the neighbourhood of that river does very much contribute to the commerce of this city, and serves to carry abroad the commodities of *Angoulesme*, and to convey thither such as the people have occasion for. The commodities sent abroad, as observed above, are chiefly brandies and paper; and they import, amongst other things, salt, which is brought from Saintonge in boats to *Angoulesme*, whence it is carried in carts and on mules, into Auvergne, Limosin, Perigord, and la Marche.

LIMOSIN, under the same generality with *Angoumois*, has *Angoumois* and Perigord on the west, La March on the north, Auvergne on the east, and Quercy on the south. Though *Angoumois* and *Limosin* border on each other, yet they are very little alike with regard to fruitfulness of the soil, or the plenty of things necessary for the support of life, or proper for trade.

Angoumois, as observed, produces abundance of corn, wine, and excellent fruit; *Limosin*, on the contrary, is barren and cold. It produces wine in some places only, and that very indifferent too; wheat hardly any where; rye, barley, and chestnuts are the materials which the inhabitants chiefly use to make their bread.

There are in both these provinces a great number of paper-mills, the manufactory of which is very much esteemed. The paper of *Angoumois*, that at least which is proper for printing, is chiefly designed for Holland, which is the reason why in the most of their manufactories they put the arms of Amsterdam upon it; they likewise send some paper to Paris. That of *Limosin* is not less excellent for the printing of books; it is, above all, admirable for prints of copper-plates; but it is seldom used for writing, not being sufficiently gummed for that purpose.

The manufactories of woollen stuffs are not very considerable in this generality. At *Limoges*, the capital of *Limosin*, they

they hardly make any other stuffs, except bays. At *Angoulême* they make ferges and flamines: at St. Jean d'Angeli, ferges and broad-cloths: at Narac, woollen-cloths and ferges: at la Rochefoucault, ferges: at Santereune, cloths: at Cogniac, flamines: at St. Leonard, very coarse woollen-cloths: and, lastly, at Brices and Tulle, bays.

All these stuffs are partly used in the places where they are made, and partly sent to Bourdeaux, Limoges, and Angoulême.

The saffron that is made in *Angoumois* is no inconsiderable object of trade for that country; and, though it be not quite so good as that of Gatinos, yet they send great quantities of it to Bourdeaux, where the English, Dutch, Swedes, Danes, and other northern nations, come and buy it; as they also do the brandies of Cogniac, which are in great esteem, particularly in England and Holland.

ANGURIA, the *water-melon*, or *citrul*. We have but one genus of this species, viz. *water-melon*, with leaves cut into many parts. Of this there are several varieties, which differ in the form and colour of their fruit. But as these vary annually from seeds, so it is needless to enumerate them here.

This fruit is cultivated in Spain, Portugal, Italy, and most other warm countries in Europe; as also in Africa, Asia, and America; and is by the inhabitants of those countries greatly esteemed for its wholesome cooling quality; but in England the fruit is not so universally esteemed, though some few persons are very fond of it.

ANGUS, in Scotland, has several quarries of free-stone and slate, with which a good trade is driven; near the castle of Inner Markie, are mines of lead; and iron ore is found in plenty near the wood of Dalbogue. The higher ground (called the Brae) supports abundance of red and fallow deer, with roebucks, and fowls; and the salmon fishery here is very considerable.

ANHALT, a principality of Germany, has Misnia on the south; the dutchy of Magdeburg, and the principality of Halberstadt on the north and north-west; the dutchy of Saxony on the east; and Thuringia on the west. Its chief trade is in beer.

1. *Dessau*. Its trade is in excellent beer, which is transported all over the country.

2. *Zerbst*, is remarkable for the same strong-beer-brewery as at Dessau, but is said to excel it; inasmuch, that in Franconia it sells dearer than wine.

3. *Koethen*: this is a considerable place, the inhabitants being computed near 15,000. They have the principal manufacture of gold and silver lace in Germany. It employs near a thousand persons: the usual expence of their wages is 1500 dollars a week. They manufacture here yearly to the value of near a million of dollars, for which there is a demand all over Germany, as well as abroad. The Saxons acknowledge, that the inhabitants of these little independent sovereignties of Koethen, Dessau, Binburg, and Zerbst, live in the land of milk and honey; whilst the knowledge which these people have of what the Saxons and Brandenburgishers suffer, convinces them that they are really happy. These petty princes possess lands sufficient for their maintenance, their revenues being reckoned about half a million of dollars. The tax on lands is four *per cent*. which rating them at twenty years purchase, is not quite one shilling in the pound. Upon an emergency, the subjects are capable of raising half a million extraordinary. According to the constitution of the empire, each of these princes is obliged to clothe, arm, and support 100 men in time of war, for the emperor's service. The towns in these little states are not so numerous, in proportion to the extent of country, as in Saxony; but better peopled. The prince of *Anhalt Koethen* has a palace in this town, but it is in a ruinous condition. He supports a body of 250 men, who are well clothed; his revenues are computed at 160,000 dollars.

ANIL (is so called by the inhabitants of all the different countries where it grows), the *indigo plant*. The characters are,

It hath a spreading impalement of one leaf, which is indented in five parts at the top. The flower is of the butterfly kind. The standard is open, bordered, and reflexed. The wings are oblong, blunt, and spread open, as is also the keel, which turns backwards. There are

ten stamina in the flower, nine of which are joined, and the other stands separate; these are crowned by roundish summits. In the center is situated a cylindrical germen, supporting a short style, crowned with an obtuse stigma. The germen afterwards becomes a taper pod, filled with kidney-shaped seeds.

Dr. Linnæus has altered the title of this genus to *indigo-pheria*; because the former was the barbarous country name, both of the plant, and also of the *indigo* made from it; but the latter name which he has given it is not much better, so I choose to continue the former title to the genus. He ranges it in his seventeenth class of plants, intitled, *diapelphia decandria*, from the flowers having ten stamina, joined in two bodies.

The species are,

1. *Anil*, or *indigo* with hoary crooked pods, spikes of flowers shorter than the leaves, and a shrubby, perennial stalk. This is the Jamaica wild *indigo*.

2. *Anil*, or *indigo* with smooth arched pods growing close to the branches, unequal winged leaves, whose lobes are blunt and oval. This is the Guatimala *indigo*.

3. *Anil*, or *indigo* with short round pods, winged leaves, having five lobes, very long loose spikes of flowers, and a perennial root. This is the Carolina wild *indigo*.

4. *Anil*, or *indigo* with woolly hanging compressed pods and winged leaves.

5. *Anil*, or *indigo* with round horizontal pods and winged leaves, having three lobes.

The second, fourth, and fifth sorts are annual plants with us; the seeds of these must be sown on a hot bed, early in the spring of the year; and when the plants are come up two inches high, they should be transplanted into small pots filled with good fresh earth, and the pots plunged into a hot bed of tanners bark; when the plants have obtained some strength, they must have a great share of free air, by raising the glasses in the day-time; and in June they may be exposed more to the open air, by which time they will begin to produce their flowers, which will be succeeded by pods in a short time after, and in August their seeds will be perfected, if the plants are brought forward in the spring.

The third sort grows to the height of five or six feet, and will abide two or three years, if it is preserved in a very warm stove in winter; this produces spikes of flowers from the wings of the leaves on the sides of the stems of the plant, and doth sometimes perfect its seeds in England. This must be raised in a hot-bed, as was directed for the three former, but must not be wholly exposed to the open air, even in the hottest weather.

The second and fourth sorts are supposed to be promiscuously used to make the *indigo*; but the second is the common sort which is cultivated in the English plantations in America: but I have been assured by a person of great credit, that he has made as good *indigo* from the first sort, as any that was produced in our plantations; and this being a much larger plant, will afford a greater quantity from the same compass of ground, than any one of the other species; and this sort will grow on poorer land, so may be cultivated in such places where the first sort will not thrive; by which means great improvements may be made with this plant in our American plantations. But the French chiefly cultivate the second sort, which is generally called *Guatimala indigo*; but there are some other sorts of this plant, which are natives of India, from which this commodity is made; two of which, viz. the fourth and fifth sorts, I have had growing in the garden at Chelsea, both which are very different in their leaves and pods from either of the American sorts which have been cultivated. I have also received seeds from India of the third sort, which is the species of *indigo* which grows naturally in South Carolina, and which was greatly esteemed some years ago by the *indigo* planters of that country, for the beauty of the commodity which it produced; but the plants being slender, and thinly garnished with leaves, which were small, they did not furnish a quantity of *indigo*, in proportion to their bulk, so of late this sort has not been much cultivated there; though the account which I received with the seeds was, that it was what the best *indigo* was made from. Miller.

The whole process in making the *indigo* being exactly described by *Pere Labat*, in his voyages, I thought it would

would not be unacceptable to the English reader, to translate his account in this place, which is as follows :

There was formerly a great deal of *indigo* made in the parish of Macauba : there is not a stream nor river in it, where one does not meet with *indigo* works, that is, backs or vats of stone-works, well cemented, in which the plant that yields the dye is put to digest : there are usually three of these vats one above another, in the manner of a cascade ; so that the second, which is lower than the bottom of the first, may receive the liquor contained in the first, when the holes, which are made in the bottom of the first, are unstopped ; and that the third may, in its turn, receive what was in the second.

The first, largest, and highest of these vats, is called the steeper or rot ; it is usually made twenty feet long, twelve or fifteen feet wide, and three or four feet deep. The second is called the battery, it is almost half as small again as the first : and the third, which is much less than the second, is called the deviling.

The names of the two first perfectly agree with their uses ; for the plant is laid to steep in the first, where it ferments, is macerated, and becomes like rotten dung : after that, the salts and substance of the leaf and rind are diffused in the water by the fermentation, which the heat and ripeness of the plant has excited in it. It is in the second that they agitate and beat this water, impregnated and loaded with the salts of the plant, till having collected, re-united, and, as it were, coagulated with one another, they form the particles which compose the dye.

As for the name of the third, I do not see how it agrees with it, unless it be because this vat is deeper coloured than the others ; for the *indigo* already formed remaining in it, consequently dyes and colours it much deeper than the others.

To which I should add, that it is only at St. Domingo that they make use of this name. In the Windward Islands they call this last vat the settler, and this name suits it perfectly well ; because it is in this, that the *indigo* begun in the steeper, and perfected in the battery, unites, grows into a mass, separates itself from the particles of water which remained in it, leaves them at top, and settles at the bottom of the vat ; whence it is taken out to be put into little bags, and then into the boxes, as I shall mention hereafter.

Nothing ought to be omitted in the building and making these vats substantial ; the strength of the fermentation is so great, that unless the stone-work and plaster be very well done, and the mortar carefully chosen and wrought, they crack ; and a very moderate crack is sufficient to let out a vat of *indigo*, and cause a considerable loss to the owner.

When this misfortune happens, the following is an easy and infallible remedy, which I can answer for, as having experienced it. Take some sea-shells, of any kind whatever, pound them without burning them, powder them, and sift them through a fine sieve. Take an equal quantity of quick-lime, and sift it ; mix these together with water enough to make a stiff mortar, and as quick as you can, stop the cracks of your vats with it. This mixture incorporates, sticks, and dries in a moment, and immediately prevents the matter's running out of the vat.

Every body does, or should know, that *indigo* is a dye used to dye wool, silk, cloths, and stuffs, blue : the Spaniards call it *Anilo* : the finest they make, *i. e.* in New Spain, comes from Guatimala, which makes a great many people call it barely *Guatimala*. It is made also in the East-Indies, particularly in the dominions of the great mogul, the kingdom of Golconda, and other places thereabouts, as Mr. Tavernier relates in his voyages. This sort is in Europe oftener called *India* than *indigo* or *anil*, people taking for its proper name, the name of the place it was made at.

Some authors, and among others, Father Du Tertre, of our order, have fancied that the *indigo* which comes from the East-Indies is more beautiful, finer, and dearer, than that which comes from the West-Indies, which they call *flat indigo*, while they call that from the East barely *India*. They would have spoken more properly, if they had called the latter *round India* ; for, by their leave, all the difference between the two *Indias*, or *indigos*, is that that made in the East-Indies is shaped like half eggs, and

that of the West like cakes ; for as for goodness and beauty, the one will not be a whit superior to the other, if both are wrought with equal care and fidelity.

The shape of the *Oriental indigo* obliges the merchants, who would carry it into Europe, to pound it, that they may put the more into the chests, or barrels they put it up in. It is certain, that being thus pounded, its grain having been broken under the pestle, ground, and reduced to powder, makes it finer than the *West-Indian indigo*, which coming in casks just as it was dried, shews its grain entire, and consequently must appear coarser ; but what is that to the intrinsic goodness of the commodity ? I maintain it is the same in both, though there seems to be a difference.

To be convinced of this truth, take a lump of sugar equally white throughout, break it in two, pound one part of it, and reduce it to powder ; this will look finer and whiter than that which is whole, which proceeds only from this, that the grain of the one has been separated and divided into a greater number of parts, which though very small, and almost insensible, yet having a greater number of surfaces, will consequently reflect more light ; whereas the other remaining entire, presenting to the sight only a large grain, which has but little surface, of course reflects less light, and by a necessary consequence must appear less white ; which is the same as appearing less beautiful, since the beauty of sugar consists in its whiteness. Methinks we may reason in the same manner upon *indigo*, and say, that *cæteris paribus*, the West-Indian indigo is as beautiful as the East-Indian, when they are both wrought alike.

I think I should add, that the *American indigo* is better for use than the other ; for who does not see, that there is no pounding this dye, without the most subtle parts being dissipated in the air, as Mr. Tavernier allows ? and who can doubt, that these parts are the best, and those that go farthest, when it is used ?

I grant, that the *indigo* which comes from the East-Indies, is dearer than that which is made in the West-Indies ; the reason is plain, it comes farther, runs greater risks ; and those who bring it would not find their account in selling it, at the same price with that which comes from a much nearer place ; but that does not at all prove it to be more beautiful, or better.

Indigo is composed of the salt and substance of the leaves and rind of a plant of the same name ; so that one may say, it is a dissolution or digestion of the plant, caused by the fermentation it has excited in the water it was laid to steep in. I know some writers pretend, that the substance of the leaves does not produce the *indigo*, which (as they would have it) is only a viscous tincture, or colour, which the fermentation of the plant diffuses in the water ; but before I take their words for it, I desire they would tell me what becomes of the substance of the plant ; for when it is taken out of the steeper, it is certain, that it has no longer the same weight, consistence, nor colour, it had before. The leaves, which were very plump and very full of juice, are light, flabby, and withered, and look more like dung than any thing else, which makes them frequently give the name of *rot* to the steeper. If then we no longer find in the leaves, and the rest of the plant, the same substance that was observable in it before it was laid to steep, is it not most natural to believe, that it is the same substance and salts, which, being freed from their inclosures, and diffused in the water, have thickened it, and by their union or coagulation have formed that blue mass which they call *indigo*, so useful in painting and dying.

The CULTURE.

This plant requires a good rich level soil, not too dry ; it greatly robs and impoverishes the ground where it grows, and must be alone. There cannot be too much care taken to keep it clean, and to hinder herbs of any kind whatever from growing near it. They weed and cleanse the ground where they intend to plant the *indigo seed*, five times over. I should think they should call it *sowing*, but the term of planting is consecrated in our isles, and I do not think I ought, for the sake of a word, to fall out with our planters, who deserve our esteem upon a thousand accounts. They sometimes carry their neatness to such a pitch, that they sweep the piece of ground as they do a room. After that, they make holes or pits, wherein the seeds are

to be put; for this purpose, the slaves, or others, who are to work at it, range themselves in the same line, at the top of the piece of ground; and going backwards, they make little pits of the breadth of their hoe, of the depth of three or four inches, at about a foot distance every way, and as much as possible in a strait line. When they are come to the end of the ground, each furnishes himself with a little bag of seeds, and returning that way they came, they put eleven or thirteen seeds into each of the holes they have made. A sort of superstition has taught them, that the number must be odd. I by no means approve of this practice; but I shall take care not to endeavour to shew them the uselessness and folly of it, being satisfied I shall only lose my time and labour.

This work is the most toilsome of any in the manufacture of *indigo*; for those who plant it, must be always stooping, without rising up, till the planting of the whole length of the piece is ended; so that when that is large, which almost always happens, they are obliged to remain two hours, and often more in this posture.

When they come to the top of the piece, they go back again, and cover the holes they have put the seed in, by thrusting in with their feet the earth they had taken out of them, and so the seed is covered with about two inches of earth.

The culture of this plant may be rendered very easy, provided the inhabitants of our colonies in America could be brought to make use of the drill-plough; for with this instrument, two persons and a horse or mule will sow more land with *indigo* in one day, than twenty persons can perform in the same time, in the method now practised; for the plough makes the drill, and the hopper, which is fixed to the plough, follows, and scatters the seeds at equal distances in the drills; and another instrument behind the hopper covers in the drills, whereby the whole operation is performed at the same time, and with great ease. Indeed the use of this machine must be understood by the persons who are to perform it, otherwise they will do it in a bad manner, but a little practice will bring any person to the right use of it.

As the *indigo* is sown in rows, a hoeing plough may be made of a proper dimension, in order to clean the ground between the rows; with this contrivance, it may be performed in much less time than in the method now practised. But in doing of this, I would advise the stirring of the ground, soon after the *indigo* plants are come up, before the weeds have got much strength, at which time they are soon destroyed; and by stirring of the ground, the plants will be greatly encouraged; and they are the strongest, and most thriving plants, which make the best *indigo*.

What *Le Bat* says of cutting the plants before they are too old, in order to have the *indigo* of a better colour, is certainly right, therefore, as soon as the flowers begin to appear, it should be cut; for if it stands much longer, the stems of the plants will grow hard and stringy, and the lower leaves will change to a yellowish colour, which will render the *indigo* less valuable; for the plants, by being too close together, will occasion their bottom leaves to decay for want of free air: the same will happen, if weeds are suffered to grow among the plants. Therefore there must be great regard to their being kept always clean.

Though all seasons are good for the planting of *indigo*, yet care must be taken not to put it in the ground in a dry time: it is true, the seed may keep a whole month in the ground, without being spoiled; but when it is planted so, one runs the risque of having it eaten up by vermin, or carried away by the wind, or choked by the weeds that spring up with it: so that prudent planters never run the risque of planting it dry, *i. e.* at a time that they do not probably expect rain in two or three days after the planting is ended: they choose therefore, usually, a moist season, which promises rain, and then they are sure of seeing the plant spring up in three or four days after its being planted.

Notwithstanding all the care that has been taken in clearing the ground where the seeds have been planted, the planter must not be careless when the *indigo* is got above-ground; because the goodness of the soil, joined

to the moisture and warmth of the climate, and the plentiful dews that fall every night, make a prodigious quantity of weeds to spring up, which would choke and absolutely spoil the *indigo*, if extreme care was not taken to weed them up as soon as they appear, and to keep the plant extraordinary neat; and very often the weeds are partly the cause of the breeding of a kind of caterpillars, which devour all the leaves in a short time.

From the time of the plant's rising above-ground, to its perfect maturity, is but two months, and then it is fit to cut: if one was to stay longer, it would blossom, its leaves would grow drier and harder, and consequently they would yield less substance, and the colour would not be near so beautiful.

After this first cutting, the new branches and leaves which the plant produces, may be cut about every six weeks, provided the season be rainy, and that care be taken not to cut them in a time of drought; because then we should infallibly lose the plant, or, as they call it there, the *choupues*, and be obliged to plant again; but all things being rightly managed, the plant may last two years; after which it must be plucked up, and new ones planted.

When the plant is ripe, which is known by the leaves, which grow brittle, and less supple, they cut it some inches from the ground. They use for the cutting of it great crooked knives made like sickles. Some planters make it into bundles like double bottles of hay, that a negro may easily carry them to the steeper: but most people put it into large pieces of coarse cloth, which they tie by the four corners; and this is more convenient, the plant is less handled and squeezed, and the small are carried away as safely as the great; and besides, the work goes on quicker this way, than in making bottles; and as time is precious every where, and especially in America, there cannot be too much care taken not to lose any.

Eighteen or twenty packets of plants, each about the size of two bottles of hay, are sufficient to fill a steeper of the afore-mentioned size. When it is filled with water, so that it covers the plants, they put pieces of wood on the top, that the plants may not rise above the water (as is done upon grapes that are put to the press) and thus all is prepared for fermenting. According as the heat is greater or less, or the plant more or less ripe, the fermentation is raised sooner or later, sometimes in six, eight, or ten hours; and sometimes one is obliged to wait eighteen or twenty hours, but very seldom longer. Then the effect of the fermentation visibly appears, the water heats, and boils upon all sides, as the grapes do in the vat; and the water, which at first was clear, insensibly grows thick, and becomes of a blue, inclining to a violet colour. Then, without meddling at all with the plants, they open the cocks, which are at the bottom of the steeper, and let all this water, loaded with the salts and substance of the plant, which were freed by the fermentation, run into the battery; and while they throw away, as useless, and almost rotten, the plants that were in the steeper, and clean it, that it may be filled with fresh, they beat the water, which they let out of the steeper into the battery.

They formerly used for this purpose a battledore wheel, whose axle was placed upon the middle of the vat, and which they turned by two handles, that were at the end of the same axle. Since that, in the room of battledores, they have put little bottomless boxes, and afterwards others, whose bottoms were bored full of holes: at present they use a kind of pretty large pails, fastened to strong poles, placed upon chandeliers, by means of which, the negroes violently and continually raise, beat, and stir the water, till the salts and other parts of the substance of the plant are united, and sufficiently, as it were, coagulated to incorporate.

The hitting this minute exactly, shews the skill of him who oversees the making of the *indigo*; for if he makes them leave off beating a little too soon, the grain not yet formed, remains dispersed in the water, without sinking and gathering together at the bottom of the vat, and is lost with the water, when they are obliged to let it out, which is a great loss to the owner; or if, when it is formed, they continue to beat, they dissolve it, and

the same inconvenience follows. This minute then must be nicked, and when found, they must leave off beating and let the matter rest.

To find this minute, they make use of a little silver cup, designed for this use alone; they fill it with this water, while the negroes beat it; and according as they observe that the *faeces* sink to the bottom of the cup, or remain dispersed in the water, they cease, or continue beating.

The General Dictionary, printed at *Trevoux*, relates very seriously, upon the credit of *Father Plumier*, a *Minim*, that the *indigo-maker*, having taken up some of the water of this battery in his cup, spits in it; and that, if the *indigo* be formed, the *faeces* immediately sink to the bottom of his cup, and that then he makes them leave off beating, if not, he makes them continue it.

This is not the only incident in which people have imposed upon *Father Plumier's* credulity and simplicity. I have been witness of it upon other occasions.

When they have left off beating, they let the matter rest, the *faeces* sink to the bottom of the vat, and gather together like a kind of mud; and the water, freed from all the salts it was impregnated with, swims above it, and grows clear. Then they open the cocks, which are placed in the battery at different distances from the bottom, and let this water run away; and when they come to the surface of the *faeces*, they open the cocks of the bottom, that the *faeces* may all fall into the deviling, or settler. There they let it settle a little while longer, after which they put it into linen bags, fifteen or eighteen inches long, made with a point, where it perfectly purges itself from the rest of the water, which remained among its particles. When that is done, they spread it in little boxes three or four feet long, two feet broad, and about three inches deep, and expose it to the air to dry it perfectly. They observe not to expose it to the sun, because it would starve the colour in drying it; and they take a great deal of care to keep it from the rain, because that would dissolve and utterly spoil it.

It sometimes happens, that the caterpillars get among the *indigo*; and, if they are let alone ever so little a while, they eat all the leaves, and often the very rind and ends of the branches, and kill the stocks; it is but lost time to endeavour to destroy them, or hinder them from ravaging a whole piece, by stopping them with a ditch. The surest way is to cut down the *indigo* with all speed, let its age be what it will, and to throw both plants and caterpillars together into the steeper; there they burst, and part with what they had devoured, and the *indigo* is not the less beautiful for it. It is true, when the plant is not come to its perfect maturity, it yields much less; but many experiments have taught us, that the colour it yields is much more beautiful; so that what is lost one way, is gained another.

I would not wait for so perfect a ripeness, before I cut the plant. Perhaps all the secret of those whose *indigo* is so much extolled beyond ours, lies only in cutting the plant when it yields the liveliest colour. I have experienced, that in leaving some cochineal flies upon some Indian figs, which were too ripe, instead of being red, they grew of a filemot colour, like the fruit they fed upon. The same thing might happen in *indigo*; and what I here propose is not a groundless doubt, since it is backed by the experiments I have just related; which plainly prove, that the same plant, cut at different ages, produces colours different in beauty. I would not venture to give this advice to men wedded to their interest, who value rather the quantity than the quality of their commodity; but I believe I have nothing to fear from our islanders, who are generous and magnificent, sometimes even beyond their abilities: I advise them, therefore, to make different trials, as to the soil, the season, the age of the plant, the water they steep it in, the point of dissolution, &c. and I am sure, that with a little time, labour, and patience, they will make *indigo* that will equal, and even excel the most boasted *indigo* of foreign countries. The planters of St. Domingo know, that in 1701 their coarse sugar was very bad, and was not made without infinite trouble; but at present every body allows, that by their labour, assiduity, and enquiries, it is grown much more esteemed than that of the Wind-

ward Islands: and why may not the same be hoped for in *indigo*?

Mr. *Pomet*, author of the *General History of Drugs*, says in his first part, chap. 13, that the Indians of the village of *Sarquesse*, near *Amadabat*, use only the leaves of the *indigo*, and throw away the plant and branches; and that it is from thence the most esteemed *indigo* comes.

I am pretty much of his opinion; for we see, that those who take the pains to strip off the grapes from the branches, before they put them into the vats, and throw away the stalks entirely, make much the best wine; because the stalks always contain an acid, which mixes with the juice of the grape in the treading and pressing them both together; and for the same reason, the *indigo plant* must contain a liquid much less perfect in colour than that of the leaves: but one ought to have the leisure and patience of the Indians, to undertake such a work, and have workmen as cheap as they are in that country, supposing the fact true, as Mr. *Pomet* delivers it from the relation of Mr. *Tavernier*.

Though I am a great friend to those experiments which may carry our manufactures to a greater perfection, yet I dare not propose this, because of the expence they must be at, who would try it; and because the profit arising from it would not, perhaps, quit cost: however, I have here given the method of the Indians of *Sarquesse*, that I may have no reason to reproach myself with having omitted a thing, which may be of some use to my country.

Good *indigo* ought to be so light, as to swim upon water; the more it sinks, the more it is to be suspected of being mixed with earth, ashes, or powdered slate. Its colour ought to be a deep blue, inclining to a violet, brilliant, lively, and bright; it ought to be more beautiful within than without, and look shining, and as it were silvered.

If it is too heavy in proportion to its bulk, it ought to be suspected, and its quality examined into; for as it often bears a considerable price, it is fit that those who buy it, should be acquainted with the frauds that may be committed in it.

The first is, the beating the plant too much in the steeper, that the leaves and rind of it may be entirely consumed. It is certain, that the quantity of the matter is very considerably encreased by this dissolution; but the *indigo* is a great deal the less beautiful for it; being blackish, thick, heavy, and fitter to be thrown away than used.

The second is the mixing ashes, earth, or a certain brown shining sand (which is pretty commonly found in the bays by the sea-side) and especially powdered slate, with the *faeces*, as they fall into the deviling, and stirring all well together, that they may incorporate, and the fraud not appear; and this fraud is much more easily committed in the powdered *indigo*, than in that which is in cakes; because it is very difficult for those heterogeneous bodies to unite so well together, as not to make, in many places, as it were, beds of a different matter; and then, by breaking the piece of *indigo*, they are easily perceived.

The two following expedients may be made use of, in order to know the goodness or badness of *indigo*.

The first is to dissolve a bit of it in a glass of water. If it is pure and well made, it will entirely dissolve; but if it is adulterated, the foreign matter will sink to the bottom of the glass.

The second is to burn it. The good *indigo* will burn all away, whereas the ashes, earth, sand, and slate, remain after the true *indigo* is consumed.

In 1694, *indigo* was sold at the Windward Islands, from three livres ten sols, to four livres per pound, according to its beauty, and the number of vessels to be freighted with it. I have known it since at a much lower price; however, the planter would not fail of making a very considerable profit of it, though he should sell it for no more than forty sols per pound; because this commodity requires fewer utensils and less charges than a sugar work.

Since the cultivation of *indigo* was introduced in South Carolina, great quantities of that useful dye have been brought from thence to England; and it may be hoped, that

that the encouragement granted by parliament to the planters, will enable them to prosecute this branch of commerce with such success, as to be a great national benefit, and of equal advantage to that country: but as yet the planters have not arrived to so much perfection in the making of it as could be wished; for most of the *indigo* which I have seen of the produce of that country, has been so hard as to render it difficult to dissolve, occasioned by their pouring a quantity of lime-water into the vat, in order to make the *faeces* of the plant subside. I have also been informed by letters from many of the planters, that after the fermentation of the plant in the vat, it comes out again almost entire, being but in a very small proportion lessened, either in bulk or weight. This may probably be owing, in great part, to their culture of the plant, as also from their vats not being large enough to contain a sufficient quantity of the herb, to make the fermentation strong enough to dissolve it; or from the vats being built in the open air, whereby the fermentation may be impeded, by the cooler breezes of the evening air; for in the islands where the best *indigo* is made, their vats are all built under cover, where their heat is greater than that in Carolina; therefore this requires the attention of the planters of *indigo*.

As to the culture of the plant, by all the information I have been able to procure from thence, they commit a great error in sowing their seeds too thick, whereby the plants are drawn up with stems, which are not sufficiently garnished with leaves; nor are the leaves so large and succulent as they would naturally grow, were the plants allowed a greater share of room, so that the stalks consist of little else but strong vessels which are not dissolvable by the fermentation, and it is only the upper parts of the plant which are furnished with leaves; like young trees growing close together which are drawn up with slender stems, having no lateral branches, nor leaves, but at their tops; therefore it is not to be supposed a great quantity of *indigo* can be produced from plants so managed; for it is a common observation of the cultivators of woad, that when their plants spire, and have narrow thin leaves, they produce but little of the dye; so that they make choice of rich strong land for sowing the seeds of this plant, and are careful to thin them, that they may have room to spread, and produce large succulent leaves, from which they always reap the greatest profit. If the planters of *indigo* in America would but imitate the cultivators of woad in this particular, they would certainly find their advantage in so doing.

Another thing in which they err, is letting the plant stand too long before they cut it, supposing from the height of the plant to procure a great quantity of the dye; but in this they are greatly mistaken, for the older the plant is before it is cut, the drier and firmer will be the stalks; therefore but little of the plant will be dissolved by fermentation, nor will the *faeces* of the old plants be near so beautiful as that of the young. Therefore it is to be wished, that they would try some few experiments in the culture and management of the plants, by sowing thin, and keeping the plants perfectly clean from weeds; as also to cut them while young and full of juice, and hereby they will be better informed how to improve it to the greatest advantage. But as labour is dear in that country, so many persons may probably object to the expence of cultivating the *indigo* in this method; therefore, to avoid this, I have before proposed sowing the seeds with a drill-plough, whereby the first expences will be greatly lessened, and the seeds more equally sown; and by the use of that hoe-plough, ten acres may be kept clean from weeds with as small expence as one, when managed by the hand-hoe; and by stirring of the ground often, and earthing up the plants, they would grow much stronger, be less liable to be destroyed by flies, and have larger and more succulent stalks and leaves. *Miller. See INDIGO.*

ANIMALS, all organized bodies endowed with life and spontaneous motion, are so called.

According to the most probable and generally received opinion, all *animals* are originally produced from eggs, in which they are contained, till their covering is penetrated, and their bulk encreased by the penetration of the male, seed so as to become ready for hatching.

When the *animal* breaks loose from the shell in its perfect form, we say the dam of it is *viviparous*; when the young is excluded with a hard covering round it, which we call the shell, we say the dam is *oviparous*. The shell of the egg in the *oviparous* kind is hard and convex, the better to resist the pressure and injuries of the air, to which it must lie exposed for some time.

All *animals* that are formed with feet, fins, or wings, and have the free power of transporting themselves from one place to another, are divided into two sexes, under each species, that they may confer their joint offices in rearing their young. On the other hand, those *animals* which are confined all their life long to one spot, are *hermaphroditical*, or have both sexes conjoined in one body, and procreate their species without the concurrence of a male. Of this sort are *limpits*, and several other kinds of shell-fish.

The philosophers comprehend *man* under the species of *animals*, and define him a *rational animal*: though among naturalists, &c. *animals* are usually confined to *irrational*.

Animals may be considered either as *aerial*, *terrestrial*, *aquatic*, or *amphibious*. We term those *aerial* which have wings, with which they can support themselves in the air.

Terrestrial are those whose only place of rest is upon the earth. *Aquatic* are those whose constant abodes are in the water.

Those are stiled *amphibious* which live freely in the air, upon the earth, and yet are observed to live long in the water, as if they were natural inhabitants of that element.

Aerial animals may be subdivided into birds and flies. Fishes, which are the chief part of *aquatic animals*, may be divided into shell-fish, scaly-fish, and those that have neither apparent scales nor shells.

And *terrestrial animals* may be subdivided into *quadrupeds*, or beasts; *reptiles*, which have many feet; and *serpents*, which have no feet at all.

Insects, which in their different changes belong to several of the foregoing divisions, may be considered as one large tribe of *animals*. They are called *insects*, from a separation in the middle of their bodies, whereby they are, as it were, cut into two parts, which are joined by a small ligature, as we see in wasps, common flies, and the like.

Besides all these, there are some *animals* which are not perfectly of these kinds, placed, as it were, in the middle betwixt them, by having something of both, as beasts and birds, in them.

The greatest part of *animals* have five senses, viz. seeing, hearing, smelling, tasting, and feeling. Some *reptiles* of the earth, and some of the *aquatics*, want one or more of these senses, and are therefore called *imperfect animals*, as worms, oysters, cockles, &c.

One would be surprized to hear sceptical persons disputing for the reason of *animals*, and telling us it is only our pride and prejudices that will not allow them the use of that faculty. Reason shews itself in all occurrences of life; whereas the brute makes no discovery of such a talent, but in what immediately regards his own preservation, or the continuance of his species. *Animals*, in their generation, are wiser than the sons of men; but their wisdom is confined to a few particulars, and lies in a very narrow compass. *Speſtacle de la Nature.*

Whence arises the uniformity we observe in all the works of *animals*? Why is every species, in various countries, constantly doing the same thing, in the same method? Why does not every individual do its work better or worse than another individual? There cannot be a stronger proof that all their operations are derived from a mechanical and entirely material origin; for did they participate, in the least degree, of that light inherent in our minds, their works would at least shew a variety, if not perfection. Every individual of the same kind would, in some of its performances, do something a little different from what another had done. No, their plan is universally the same. The order of their actions may be traced through the whole species; it is not left to each individual: and whoever would therefore attribute a soul to *animals*, lies under a necessity of making but one

one to each species, of which every individual would be an equal partaker. This soul, therefore, would be divisible, consequently material, and of a nature entirely different from ours. *Buffon's Hist. Naturelle.*

All substances produced from *animals* are, by the chemists, said to belong to the *animal kingdom*, in order to distinguish them from others which belong to the *vegetable* and *mineral kingdoms*.

The earth of *animals* is not found to differ from that of vegetables in any respect; but the salts of *animals* differ very remarkably from those of vegetables, in being volatile; whereas those of vegetables, before they have undergone putrefaction, are fixed so as not to be capable of elevation by the most intense fire. See ANALYSIS.

ANIMALCULE, a minute *animal*, scarcely, if at all, visible to the naked eye.

Those who have made the most minute researches, and the most accurate enquiries into the natures of the several objects subjected to their senses, have found, that the substances upon which they employed their curiosity were often quite different from what, at first view, they appeared to be. Thus, for instance, the whole earth has been found replenished with an inexhaustible store of what we should least of all suspect, that is, an infinite number of *animalcules* floating in the air we breathe, sporting in the fluids we drink, or adhering to the several objects we see and handle. The conjectures and hypotheses relating to the production, generation, structures and uses of these *animals*, have been as various, and, perhaps, as far remote from truth, as any that ever were contrived by the caprice, or embraced by the credulity of mankind. But conjecture, obscurity, and darkness are now, in a great measure, banished from this branch of learning, since, by the assistance of microscopes, we not only know that these *animalcules* exist, but are also enabled to discover their particular shapes, and various degrees of motion.

Water, the least compounded of any fluid we are yet acquainted with, not only contains a large number of these *animalcules*, but also proves a proper medium for their multiplication. See *Mem. de l'Acad. Roy. des Sciences*. 1707.

If then water, the most simple of all other fluids, thus abounds in *animalcules*, and proves, if I may so speak, a proper medium for their production and multiplication, how much more must we suppose this to be the case with other fluids of a richer texture, and a more compound nature? What, for instance, must we think of the vast store, and surprising variety of *animalcules* contained in that heterogeneous fluid the air? What numbers of them must be contained in fermented liquors, generous wines, and acids of every kind? How must they abound in the testicles, the seed, and other juices of *animals*? What must their number be in fowls and fishes, and even in reptiles, and in insects of the smallest and most inconsiderable size. However romantic this may appear to one unaccustomed to pry into the hidden wonders of the works of nature, it is nevertheless far from being one of those curious hypotheses, which tantalize the mind with delusive appearances of truth for a while, and leave it at last to sit down in a dejected state, and bewail its want of evidence; for Mr. *Lewenboeck*, that great enricher of natural history, and accurate observer of the minutest works of the creation, has subjected these matters to the evidence of sense, and even given an irrefragable demonstration, that the number of *animalcules*, contained in the seed of one cod-fish, is more than ten times that of all the men living upon the whole surface of our globe.

In short *animalcules* abound in every part of the creation, and the very food we use is mixt and incorporated with the eggs laid by them. In the Philosophical Transactions there are very surprising accounts of *animalcules* found in various substances, and of different sorts.

ANIMATED Needle, one touched with a load-stone, or animated with the magnetic effluvia.

ANIMATED Power, in mechanics, a man, or other animal, in opposition to an inanimated one, as that of springs, weights, &c.

ANIMATED Mercury, among the chemists, signifies a mercury, which being joined with a perfect metal, is

reduced to a certain species. Such a mercury is wanted by the *spagirists* to help them to the philosopher's stone.

Mr. Boyle calls that *animated mercury* which, from some spirituous particles it is impregnated with, is rendered capable of growing hot, when mingled with gold.

ANIMATED. The French give the name of *animated gum* to a sort of yellowish and transparent gum, which drops by incision from some trees in New Spain.

ANIME, or Gum ANIME, in pharmacy, a gum, or white resin, chiefly brought from America.

It flows from an incision made in a tree of a moderate bigness, the leaves of which resemble those of the myrtle.

The best *gum anime* is white, dry, friable, clean, of a good smell, and soon consumes, when thrown into the fire: it contains a great deal of oil, and essential salt.

It is proper to discuss, soften, and dissipate cold humours, and is of use in the head-ach, and to strengthen the brain. *Lemery*.

The Brasilians apply the scum of it for disorders of the head from colds; and are of opinion, that it is of service to other parts of the body likewise, when affected by the same cause. *Lewis*.

ANINGA, a root which grows in the Antilles islands, and is pretty much like the China plant. The root of the *aninga* is now used by sugar-bakers, for refining the sugar, and is more effectual and less dangerous than the sublimate of mercury and arsenic, that were used formerly, before it was found that the *aninga-root* was proper for that use.

ANJOU, a province in France. The principal manufactures established in this fruitful, and plentiful part of France, in which may be included *Touraine*, *Maine*, and *Perche*, are comprized in the silken, woollen, and tanning commodities. The first has its establishment in *Tours*, the capital of the province of *Touraine*, where are made all sorts of fine silks, as velvets, mohair, ferges, brocades, satins, taffeties, &c. in which formerly were worked up 2400 bales of silk, though at present three or four hundred are more than sufficient; and the same decay that has happened in this manufacture has occurred in the woollen, this hardly employing fifteen or twenty looms now, which occupied two hundred and fifty before. At Amboise, Chinon, Richelieu, Loudan, Loches, Beaulieu, St. Christophle, St. Pater, Laval, Beaumont, la Roue, Roziers, Montefors, Villeloin, Orbigny, Reugnay, Chateau-Renault, Neuville, Pontpierre, Maray, Neufay, Loifaut, and Montricaré, are made much the same sorts of stuffs and cloths, as in the last-mentioned province. Few hides are now tanned here, in comparison with the great quantity that used to be formerly. The natural products of these parts consist in wines, brandies, salt-petre, and such abundance of fruits raised, and afterwards preserved by the natives, as have drawn on this province the appellation of the garden of France. In the parishes of Parcenay, Abillon, St. Mars, and Mettray, are quarries of mill-stones; and near the abbey of Noyers, a copper-mine was discovered in the latter end of the last century. About 7000 pieces of cloths, ferges, druggets, linsley-woolseys, and other stuffs, are made in this district of *Touraine*, besides some caps, hats, and stockings; in that of *Anjou* are gathered wines, flax, and hemp, of which large quantities of thread and linen are made; the quarries of slate, iron, and coal-mines, the whitstries for linen and wax, the refineries of salt-petre and sugar, the forges and glass-houses, with the manufacture of Estaminas, and druggets of various sorts, make up the commerce of this province; of these latter about 4000 pieces are made yearly at Angers, Chateau-Gontiers, la Fleche, Beango, Saumur, le Ludi, Dove, Montreuil, Bellay, Beaufort, and Durtal, besides some hats, caps, &c. In the territory of Maine, about 5300 pieces of the aforesaid woollens are made, though the principal manufacture of this province is linen, for which it produces the materials in vast plenty, and there has been seen 20,000 people employed at once in the several branches of it: here are also some glass-houses, iron-mines, &c. and large quarries of a middling sort of marble. The manufactures of the small province of *Perche*, are linens, stuffs, and paper, of which the first

is the most considerable; they have also here some forges for iron, and carry on some trade in the grazing way.

ANISE, or ANIL, a greyish wood, that comes from the Indies in thick logs, or billets, and which is called *anise* because of its scent, which comes pretty near that of the plant which bears that name, and grows very commonly in the gardens in France, and elsewhere.

The *anise-wood* is used in inlaid-work, and turner's wares. The druggists also sell the seed of it, disguised under different names, calling it sometimes *anise* of China, of Siberia, of the Philippine islands, and of the Indies; but, to give it more reputation, they call it most commonly the seed of *Badian*, or the seed of *Zingi*.

This seed, which is contained in a small pod, very hard and thick, in the form of a star, is perfectly like that of the *coliquintida*, except only that it is of a tanned colour, and shining, and that it has a pretty good smell.

The Chinese use it with their tea, and the Dutch in the East-Indies, after their example, also put some into that liquor, and into their sherbet, pretending that it gives it a more pleasant flavour. The use of it is not introduced in France, nor in England, that we know of.

ANISUM, in botany, an umbelliferous plant, commonly called *anise*.

It is a small tender plant, producing one stalk, seldom growing above two feet high, whose lower leaves are whole, round, and indented about the edges; but those which grow upon the stalk are winged, and finely divided, of a pale green colour. It flowers and seeds in July, the root dying every year after it has yielded its seed. It is cultivated in Germany; but the best seed, which is the only part used, comes from Spain.

Aniseed is carminative, expelling wind out of the stomach and bowels, both given at the mouth, and in clysters. It is very useful against cold affections of the lungs, difficulty of breathing, and asthma. The oil, distilled from the seed, is used for the same purposes, and often applied outwardly in carminative and anodyne liniments, and particularly for the pleurisy, and other pains in the side. *Miller*.

The good qualities *anise-seeds* ought to have are as follow: it must be fresh, large, plump, newly dried, of a good smell, and of a biting and aromatic taste, without any bitterness.

The confectioners use a great deal of *anise-feed* in sugar plums, which they sell under divers denominations.

There is extracted from *anise-feed*, by distillation, a kind of white oil, called essence, or quintessence, of *anise*, of which that which comes from Holland is the most esteemed. That oil, to which the physicians and apothecaries ascribe great virtues, is of a very strong and penetrating scent; for which reason it is used with discretion. Perfumers mix some of it with their pastes and pomatums, to give them a sweet scent. They also put some of it in certain mixtures of aromatics.

Whilst *anise-feed* is distilling to extract the oil from it, there comes a clear water from it, which is called *anise-water*, the effects of which are the same with those of *anise-oil*.

That oil must be chosen white, clear, transparent, of a strong scent, as easily liquified by the least heat, as congealed by the least cold.

Anise-feed affords, likewise, another sort of oil, quite green, which is got by expression, to which the same virtues are ascribed as to the white oil, but the effects of it are neither so strong nor so quick. It is to M. Charas that, in France, the discovery of this last sort of oil is owing. *Anise-feed* is noted among the drugs and spices to be garbled, in *Stat. 1 Jac. I. cap. 19*.

ANKER, a liquid measure at Amsterdam. It is the fourth part of an *aem*, and contains two *stekans*. A *stekan* is sixteen *mingles*, and a *mingle* two pints of Paris, or about two quarts wine measure in England: so that an *anker* contains sixty-four pints of Paris, or about thirty-two gallons English measure. See *AEM*.

ANNABASSES, a coarse blanketing made in France for their Guinea trade, and in particular for that on the coast of *Angola*.

ANNO DOMINI, is the computation of time from the incarnation of our Saviour, which is generally inserted in the dates of all public writings; sometimes with,

and sometimes without the year of the king's reign. As the Romans made their computation from the building of the city of Rome, and the Grecians by Olympiads; so Christians, in remembrance of the happy incarnation of our Saviour, reckon their time from thence. The day of the month, the year of our Lord and Saviour Christ, and the year of the king's reign, are the usual dates of deeds. 2 *Inst.* 675.

ANNUITY, signifies a yearly rent to be paid for term of life, or years, or in fee; and it is also used for the writ that lies against a man for the recovery of such a rent, if it be not satisfied every year according to the grant. *Reg. Orig.* 158. F. N. B. 152.

An *annuity*, according to Lord Coke, is an annual sum of money granted to another in fee, for life, or years, which charges the person of the grantor only. *Co. Lit.* 144. b. The author of the *New Terms of Law*, defineth *annuity* to be a certain sum of money granted to another in fee-simple, fee-tail, for term of life or years, to receive of the grantor or his heirs, so that no freehold be charged therewith, and whereof a man shall never have assise, or other action, but a writ of *annuity*.

An *annuity*, strictly taken, is a yearly payment of a certain sum of money granted to another in fee-simple, fee-tail, for life or years, charging the person of the grantor only; if payable out of lands, it is properly called a rent-charge; but if both the person and the estate be made liable, as they most commonly are, then it is generally called an *annuity*. *Co. Lit.* 144. b. *Finch.* 161. 1 *Roll. Abr.* 226. *Doct. & Stud. Dial.* 2. cap. 30.

When *annuities*, payable yearly, half-yearly, &c. are not paid as they become due, such annuities are said to be in arrears; and, therefore, to find the value of an *annuity* in arrears, we must calculate what all these payments will amount to, allowing any rate of simple interest for their forbearance, from the time each particular payment became due: in order to this, put $u =$ the *annuity*, $t =$ the time it has continued unpaid, $R =$ the ratio, or interest for 1 l. for one year, and $a =$ the amount of the *annuity* and its interest.

Then, if $u =$ the first year's rent due with interest, Ru will = the interest, and $2u =$ the rent due at the end of the second year. And, consequently, $2Ru =$ the interest, and $3u =$ the rent due at the end of the third year; and $3Ru =$ the interest, and $4u =$ the rent due at the end of the fourth year: and so on for any number of years.

Hence it is evident, that $Ru + 2Ru + 3Ru + 4Ru + 5u = a$, the sum of all their rents and their interests, being forborn five years. From whence it follows, that $Ru + 2Ru + 3Ru + 4Ru = a - tu$. Here $t = 5$. Divide the equation by u , and we have $R + 2R + 3R + 4R = \frac{a - tu}{u}$.

In order to find the sum of this progression, put $z = R + 2R + 3R + 4R$, &c. Then $1 + 2 + 3 + 4$, &c. $= \frac{z}{R}$.

Here the sum of the first and last terms is $4 + 1 = 5 = t$.

And the number of all the terms is $4 = t - 1$. Therefore $\frac{t-1}{2} \times t =$ the sum of all the terms. That is,

$$\frac{t-t}{2} = \frac{z}{R} \quad \text{Hence,} \quad \frac{tR-tR}{2} = z. \quad \text{Consequently,} \\ \frac{tR-tR}{2} = \frac{a-tu}{2}.$$

From this equation the following theorems are easily and naturally deduced.

$$\text{THEOREM 1.} \quad \frac{tRu - tRu + 2tu}{2} = a. \quad \text{Or,} \quad \frac{tRu - tu}{2} \times R : \times tu = a.$$

$$\text{THEOREM 2.} \quad \frac{2a}{tR + tR + 2t} = u. \quad \text{THEOREM 3.} \\ \frac{2a - 2tu}{tRu - tu} = R. \quad \text{Let} \quad \frac{2}{R} - 1 = X. \quad \text{Then} \quad t = \sqrt{\frac{2a}{Ru}}$$

$$+ \frac{xx}{4} : - \frac{1}{2} x. \quad \text{THEOREM 4.}$$

By the help of these four theorems, all questions of this nature may be easily solved. Thus, for example:

Suppose 250 l. yearly annuity be forborn or unpaid seven years, what will it amount to in that time at six per cent. for each payment as it becomes due?

Here $u = 250$, $t = 7$, and $R = 1.06$, are given, to find a . Which is easily performed by THEOREM 1. For, first $250 \times 7 = 1750 = tu$; and $1750 \times 7 = 12250 = ttu$.

Again, $12250 - 1750 = 10500 = ttu - tu$. And $\frac{10500}{2} \times 0.06 = 315$. Lastly, $315 + 1750 = a = 2065$ l. the answer required.

Having shewn the method of finding the value of annuities in arrears, we shall proceed to explain the manner of finding the present worth of annuities, composed at simple interest.

The whole business of purchasing annuities, or taking of leases, &c. for an assigned time, depends upon the true equating of the principal, or money laid out on the purchase, with the annuity or yearly rent, by allowing the same rate of interest to both parties; which may be easily performed by carefully attending to what has been already said. For example, what is 75 l. yearly rent, to continue nine years, worth in ready money at 6 per cent. per annum, simple interest?

First, by Theorem 1. find what the proposed yearly rent would amount to, if it were forborn nine years at 6 per cent. which by the said theorem will amount to $837 = a$.

Then find what principal being put out to interest, for the same time, and at the same rate, will amount to 837 l. = a . See INTEREST Simple.

Thus $tR = 0.54 = 9 \times 0.06$. $tR + 1 = 1.54$, by which divide 837 , and we have $543.5064 = 543$ l. 10 s. 1½ d. the present worth of the annuity required.

In purchasing annuities or pensions, &c. and taking leases in reversion, it is very usual to allow compound interest to the purchaser for his ready money, and therefore, it is very requisite to understand it.

Let $\begin{cases} P = \text{the principal put to interest.} \\ t = \text{the time of its continuance.} \\ a = \text{the amount of the principal and interest.} \\ R = \begin{cases} \text{the amount of 1 l. and its interest for 1 year} \\ \text{at any given rate, which may be thus found:} \end{cases} \end{cases}$

Viz. $100 : 106 :: 1 : 1.06 = \text{the amount of 1 l. at 6 per cent.}$

Or $100 : 107 :: 1 : 1.07 = \text{the amount of 1 l. at 7 per cent.}$

And so on for any assigned rate of interest.

Then if $R = \text{the amount of 1 l. for 1 year at any rate.}$

$RR = \text{the amount of 1 l. for 2 years.}$

$RRR = \text{the amount of 1 l. for 3 years.}$

$R^4 = \text{the amount of 1 l. for 4 years.}$

$R^5 = \text{the amount of 1 l. for 5 years. Here } t = 5.$

For $1 : R :: R : RR :: RR : RRR :: RRR : R^4 :: R^4 : R^5$ &c. in $\div$.

That is, as one pound, is to the amount of one pound at one year's end, so is that amount to the amount of one pound at two years end, &c.

Whence it is plain, that compound interest is grounded upon a series of terms, encreasing in geometrical proportion continued; wherein t (viz. the number of years) does always assign the index of the last and highest term, viz. the power of R , which is R .

Again, as $1 : R :: P : PR = a$ the amount of P for the time that $R = \text{the amount of 1 l.}$

That is, as 1 l. is to the amount of 1 l. for any given time; so is any proposed principal (or sum) to its amount for the same time.

From the premises, I presume, the reason of the following theorems may be very easily understood:

Theorem 1. $PR^t = a$, as above.

From hence the two following theorems are easily deduced:

Theorem 2. $\left\{ \frac{a}{R^t} = P. \right.$

Theorem 3. $\left\{ \frac{a}{P} = R^t. \right.$

By these three theorems all questions about compound interest may be truly resolved by the pen only, viz.

without tables; though not so readily as by the help of tables, calculated on purpose.

ANNUITIES, or PENSIONS in arrear, computed at compound interest.

Suppose $u = \text{the first year's rent of any annuity without interest.}$

Then will $Ru + u = \text{the amount of the first year's rent and its interest; more the second year's rent.}$

And $RRu + Ru + u = \text{the amount of the first and second years rents, with their interest; more the third year's rent, \&c.}$

Here $RRu + Ru + u = a$ the amount of any yearly rent or annuity, being forborne three years. And from hence may be deduced those proportions:

Viz. $u : Ru :: Ru : RRu :: RRu : RRRu$, and so on in $\div$ for any number of terms or years denoted by t , wherein the last term will always be uR^{t-1} .

Consequently $a - uR^{t-1} = \text{the sum of all the antecedents.}$

And $a - u = \text{the sum of all the consequents in the series.}$

And, therefore, it will be $u : uR :: a - uR^{t-1} : a - u$. Ergo $au - uu = Rua - uuR^t$ which being divided all by u , will become $a - u = Ra - uR^t$.

From this last equation, it will be easy to raise the following theorems.

Theorem 1. $\left\{ \frac{uR^t - u}{R - 1} = a. \right.$

Theorem 2. $\left\{ \frac{Ra - a}{R - 1} = u. \right.$

Theorem 3. $\left\{ \frac{Ra + u - a}{u} = R^t. \right.$ If this equation

be continually divided by R until nothing remains, the number of these divisions will be t .

Again, $\left\{ \frac{a}{u} R - R^t = \frac{a - u}{u} \right.$ If this equation be resolved into numbers by a converging series, the root will shew the value of R .

By these theorems, all questions relating to annuities, computed at compound interest, may be solved.

Several ingenious mathematicians, as Dr. Halley, De Moivre, Sympson, &c. have explained the method of computing the expectation, or estimate of life; but it will be sufficient for our purpose, to mention that deduced by the great Dr. Halley from the monthly tables of the births and funerals in Breslau, the capital city of the province of Silesia. Whence he proves, that it is 80 to 1 a person of twenty-five years old will not die in a year: that it is $5\frac{1}{2}$ to 1, that a man of forty will live seven years: that a man of thirty years old may reasonably expect to live twenty-seven or twenty-eight years, &c. See *Philos. Transf.* N° 196.

Now, from these and the like proportions, be justly infers, that the price of insurance upon lives ought to be regulated: there being a great difference between the life of a man of twenty and one of fifty. For example, it is a hundred to one that a man of twenty dies not in a year, and but 38 to 1, for a man of fifty years of age. And upon these also depends the valuation of annuities for lives. For it is plain, that the purchaser ought to pay only such a part of the value of any annuity, as he hath chances, that he is living.

And for that purpose he hath taken the pains (which was not a little) to compute the following table, that shews the value of annuities for every fifth year of age to the seventieth.

Age.	Years purchase.	Age.	Years purchase.	Age.	Years purchase.
1	10,28	25	12,27	50	9,21
5	13,40	30	11,72	55	8,51
10	13,44	35	11,12	60	7,60
15	13,33	40	10,57	65	6,54
20	12,78	45	9,21	70	5,32

The same ingenious gentleman proceeds on, and shews how to estimate or find the value of two lives, and then of three lives.

The common method of purchasing annuities is at a certain number of years purchase; for which reason, the following tables may be useful to shew how long the annuitant must live, to be re-imburfed his principal money, which interest, at any given rates.

The table is very plain, as appears by this example. Suppose eleven years is given for an annuity.

years. days.				
Then if the annuitant lives	12	200	2	} per cent. per ann.
	13	9	2½	
	13	200	3	
	14	48	3½	
	14	286	4	
	15	190	4	
	16	134	5	
	18	188	6	
	21	264	7	
	27	201	8	
	53	160	9	
		he will be re-imburfed his principal, with interest, at the rate of		

The fractions of the year are made in days, for the greater exactness, though it is common for annuities to be paid either half yearly or quarterly.

A TABLE to calculate the value of annuities upon lives at 4l. and 5l. per cent. continuance of the lives to re-imburse the annuitants their purchase-money.

Years purchase given for a life.	At 4 per cent.		At 5 per cent.	
	years.	days.	years.	days.

15	23	132	28	151
16	26	18	32	360
17	29	19	38	322
18	32	167	47	71

To ANNUL, in book-keeping, signifies to render an article null by making it of no import in the account. It is chiefly in the Italian method of book-keeping by double entries, that this rule of annulling is practised: instead of erasing a sum that has been carried by mistake to the credit of an account, the account is debited for the same sum, and on the contrary, if a sum has been placed through mistake to the debtor side of the account, the same sum is placed to the credit of the account, and it is customary to mark the articles thus annulled in the margin with the same letters, as AA. or BB. after which the same sum is carried to the account, as it ought to have been if no error had happened.

ANODYNES, in physic, medicines which procure sleep, and ease from pain.

Among the principal of anodyne medicines, are all the medicinal preparations of the poppy, especially opium, which the ancients called the tears of the poppy, or meconium, which is an extract of the poppy procured by boiling.

Anodynes are, in some cases, of the greatest use, but they should always be administered with prudence and judgment.

Hoffman says, that sleep and anodyne medicines quench thirst; because they remove the stricture from the glands, and relax the ducts of the fauces, by which means a more plentiful effusion of moisture is procured to them.

But anodynes in a more lax sense, may signify all remedies which relieve pain. Thus a lancet may, not improperly, be said to be an anodyne; because, by evacuating a part of the blood, it mitigates inflammatory pains. Thus all relaxing remedies, diluters, and medicines which by any means destroy acrimony, or expel wind, are, in their effects, anodynes, when properly applied.

ANOMALISTICAL Year, the periodical time which the earth takes up in revolving round her orbit; whence it is also called the periodical year.

The anomalistical year consists of 365 days, 6 hours, 9 minutes, and 14 seconds; which is something more than the tropical year. This difference is occasioned by the precession of the equinoxes.

ANONA, Lin. Gen. Plant. 613. Guanabanus, Plum. Nov. Gen. p. 42. Tab. 10. Annona Rati Metb. Plant. 153. There are many species of this genus, which are natives in the warm parts of America, Africa, and Asia; some of which are esteemed for their fruits, which are usually served up at the tables of the principal inhabitants of the countries where they grow; and are, by the English in America, distinguished by the following titles; viz. custard-apple, paw-paw, sweet-sop, water-apple, &c.

ANONYMOUS, that which has no name. Partnerships in trade in France are stiled anonymous, when they are not carried on under any particular name, but wherein each of the partners trades visibly on his own account, and in his own name; after which, all the partners give one another on account of their profit or loss in trade. These sorts of partnerships are concealed, and known only to the partners themselves.

ANONYMOUS partnerships in trade, in France, are such, also, wherein persons of fortune and quality deposit sums of money, in order to share of the profit and loss. To this end, those who furnish the capital have no trouble in the carrying on the trade, nor do their names appear to be any way interested therein.

ANTARCTIC Pole, in astronomy, the south pole, or that point in the heavens, which the south-end of the earth's axis points to.

ANTARCTIC Pole, in geography, signifies the southern extremity of the earth's axis.

ANTARCTIC Circle, a lesser circle of the sphere, 23° 30' distant from the south pole, and parallel to the equinoctial.

ANTEDEATE, a falsified date, a date set down before the true one.

Antedates are of a very dangerous consequence in matters of trade.

ANTILLES Islands, lie in America, situate in the Atlantic ocean, between 59 and 63 degrees of west longitude from London, and between 11 and 18 degrees of north latitude. Some call these isles the Caribbees, from the first settlers, though this is a denomination that most geographers confine to the Leeward Islands, with regard to the usual course of the European ships from Old Spain, or the Canary Islands to New Spain; in which course they must necessarily pass between some of those islands.

They are commonly distinguished by the Great and Little Antilles. Besides the original natives, they are inhabited by Spaniards, or English, French, or Dutch, as they have happened to be possessed by them. We shall give an account of them, as they occur, in their alphabetical order.

ANTIMONY, a kind of mineral substance, composed of metallic particles combined with a sulphureous and stony substance.

Ores of antimony are found in many countries, and very plentifully in several parts of France. The glebes of antimony are dug out of the earth, mixed with a stony matter, and the pure mineral or metal is separated by breaking the glebe into small pieces, and afterwards treating it in the same manner as in refining other impure metals.

Nothing is more common than to observe, as it were, long and shining needles, on the surface of broken antimony; and that on which they are most distinct and visible, is esteemed the best. Sometimes these streaks are ranged with so much order, and branch out with so much regularity in certain directions, that even those that have daily

daily opportunities of observing this phenomenon, cannot help being struck with its beauty. The figures of the constituent molecules of this mineral may, possibly, contribute something to the formation of those needles: but the texture and configuration of the constituent parts will not alone account for the disposition of these streaks, and their arrangement with regard to each other; since upon breaking different lumps of the same *antimony*, and of the same shape, we often observe quite different arrangements of these streaks of needles. Let us take, for instance, equal masses of *antimony*, of a regular conical figure, because this mineral is generally melted in a species of crucibles which resemble a funnel, or an inverted cone. Let several of these conical masses be broken, each into several parts; and we shall find the needles of the same cone disposed in different directions, and varying in each different piece. In one of these masses, from a certain height, we may observe all the needles directed to the point of the cone; a little higher, the needles shall be horizontal, or nearly perpendicular to the former; above these we shall observe others which shall sometimes be all directed to some point of the base of the cone, and sometimes divide themselves into cones, which shall have different summits. In another of these masses, we shall not find the needles disposed in a horizontal direction, but running into conical parcels, in directions quite the reverse of each other; that is, one conical parcel shall have its summit pointed to the apex of the cone, and that of the other shall be directed to the base. In some lumps we shall perceive needles every where, in others we shall discover none at all. Often these needles appear in one part of the lump, when no such thing is to be seen in the rest. Very commonly we see them disposed in parcels of a conical figure, whatever the external form and shape of the lump is; for the internal cones have no dependence upon the external conical form of the common mass. Sometimes the needles are disposed along the sides of the cone, and their direction seems to follow the sides of the vessel in which they become fixed. Notwithstanding these varieties, the cause which contributes to the production and arrangement of these needles, is manifest; and, however little we may advert to it, seems to be owing to nothing else but that refrigeration, by means of which the mineral substance is changed from a fluid into a solid state. It is to this refrigeration, and its progress, that the needles of *antimony* owe their production and direction: any substance, whose fluidity depends only on the gross particles of the fire, which separate and agitate its constituent molecules, resumes its former solidity, when it is left to itself, and when the particles of the fire is dissipated: now these cannot possibly be dissipated but successively, and in a certain order, which is generally such, that those parts of the melted substance, which are either next to the sides or the mouth of the crucible, first assume a consistence; then the molecules next to these become fixed, and so on till the whole mass loses its fluidity: now each fixed molecule applies itself so much the more effectually and necessarily to that which is contiguous, as the contact of each fixed molecule, with that which is contiguous, contributes not a little to fix it, and deprive it of motion.

Molecules successively added to each other, form a kind of fibres, threads, or needles, the directions of which shew the particular order in which the refrigeration has been carried on. If the crucible was of the shape of a hollow bowl; if its sides were, every where, equally thick, equally warm, of the same consistence, and equally acted upon by an air equally cold; and if the melted substance was of the same uniform nature in all its parts, all the needles, or fibres, would be so many rays terminating in the center of the bowl. If the substance was such, that its fixed particles were almost all of a length, we should find, also, concentric beds of needles, formed by parcels of each ray, at an equal distance from the center.

But as so many remarkable circumstances do by no means occur in the ordinary refrigeration of *antimony*, neither is it possible they should: hence the regularities we have been speaking of must necessarily arise. *Reaumur. Mem. de l'Acad. Roy. 1724.*

A great many excellent medicines are furnished by this mineral to the practice of physic. Hence it has become a very important subject, so that many volumes have been written concerning it. The empirics derive most of their boasted secrets from this mineral, as is evident from the irregularity of their operations; for *antimonial remedies* have this peculiar property, that they will, sometimes, operate with great violence; and, sometimes, even in the same dose, and same person, without any apparent alteration of circumstances, shall have no visible operation.

The most common preparations of *antimony* are, the *liver of antimony*, *crocus metallorum*, *emetic tartar*, *glass of antimony*, and the *flowers, butter, and cinnabar of antimony*; the powder of *algarath*; the *universal panacea*, *bezoar mineral*; *diaphoretic antimony*: *kermes mineral*.

Antimony is composed of two or three parts of sulphur, not at all different from the common sort, and one of a white, brittle, femimetallic substance. This mineral easily melts, and in a great fire proves totally volatile. Calcined with a moderate heat, and at length melted, it runs into a reddish glass, capable of giving a strong emetic quality to wine. Fused along with fixed alkaline salts, or boiled in a strong lixivium of them, the more sulphureous parts are first taken up, and at length, the reguline in notable quantity. *Regulus of antimony* is soluble in the vitriolic acid, corroded by the nitrous, perfectly dissolved by *aqua regia*, and the concentrated acid of common salt, but not by vinegar, or the vegetable acids; though these latter extract enough from it to become powerfully emetic. Crude *antimony* in powder, considered as a medicine, has no sensible effect; though perhaps this may be owing to the gross manner in which it is usually prepared; for I have seen notable effects from it when finely levigated. Many of the preparations of this mineral are most violently emetic, which yet by a slight alteration, or addition, lose their virulence, and become either gently purgative, or powerfully diaphoretic. *Lewis.*

Of the application of ANTIMONY to metallurgy.

What the *regulus of antimony* is capable of performing in the way of improving metals, we may learn, says Dr. Stahl, from *Kern der Alchymie*, who informs us, (1.) That the simple *regulus* being mixed or melted along with silver, and then evaporated, leaves the silver enriched with a few grains of gold; and, (2.) That the *crocus metallorum*, or the *scoria*, obtained in the preparation of the simple *regulus*, being edulcorated and cemented with silver, and lastly melted into it, by a continued fusion of several hours, renders the silver something of a golden nature.

This reguline substance of *antimony* may likewise be commodiously employed in the extraction of the metallic sulphurs, as they are called, and their purification from all terrestrial heterogeneous *faeces*; whence the compound metallic *regulus*, viz. the martial, the venereal, and the jovial arise. There are some who question, whether these compound *reguluses* do actually participate of any thing from the metal wherewith they are prepared; and suspect there is no more performed in this case, than a bare absorption of the sulphur abounding in the *acrimony*, upon which the reguline part subsides alone. The meaning whereof is this, that the reguline substance, confusedly intermixed with a large proportion of adhering sulphur, is what makes *antimony*; and that, if this sulphur be taken away, the remainder becomes *regulus* again: whence, as the subjects which easily take away this sulphur from *antimony*, are alkalies, iron, copper, tin, and lead, any one or more of these, being added to *antimony* in fusion, ought, upon that supposition, only to receive or imbibe the sulphur, and leave the *regulus* pure and unmixed, collected in a metallic form at the bottom.

This opinion is overthrown, by numerous experiments and instances to the contrary. For example, if any such metallic *regulus*, though made ever so pure, be simply evaporated by the blow-pipe, upon a coal, it leaves a pure grain of metal behind it, which, upon the proof, is found to be gold or silver,

So likewise the martial *regulus* in particular, being melted in a crucible, with the addition of coals, or common sulphur, and detained for some time in the fire, a ruddy powder or flowers evaporate or sublime from it, which nearly approach to the nature of cinnabar: and, if digested with a menstruum consisting of three parts of distilled vinegar, and one of *aqua fortis*, it affords a green extraction; but nothing of this kind happens in any of the cases, when only the simple *regulus* is employed.

This extraction of the pure metallic sulphur deserves to be the more attentively considered; because *Becher* expressly advises us to beware of using corrosive, saline menstrua for this purpose, as they might easily, together with the useful part of the *regulus*, or rather of the iron or copper, corrode and extract also the useless, earthy, and styptic part; which, upon melting them together, would again accrete to the useful part, and conceal or disguise it under its former ignoble veil.

But this separation is excellently performed by the *regulus* of antimony itself; there being no danger that this should imbibe any of the terrestrial, styptic substances. But if there be any suspicion, that such a compound *regulus* should still contain something of the crude substance of the metal, as we usually find to be the case in the martial *regulus*, melted in a strong heat, and suddenly poured into the cone; or if the *antimony* employed contained but little sulphur, or only so small a proportion was used as could not totally corrode the metal; whence the *regulus* becomes porous, less leafy, and less bright and shining, but rather appears discoloured and grey, and of itself indisposed to flow, unless the fire be made very intense; and whence also the venereal *regulus* turns ruddy or livid in the space of a few days: in these cases the *regulus* is to be beat again, mixed with its own, or a half more than its own weight of crude *antimony*, and thrown into a well ignited crucible, and fused with a very good heat, so as to make the matter run very thin, in which state it is to be directly poured; and, by this means, the *antimony* again imbibes all the crude metal that still adhered to the *regulus*, and thus at a single operation renders it highly pure and bright: an effect, which in the common way with nitre, is not obtained without a deal of trouble.

It must be further observed, that this reguline substance of *antimony* is convertible into various forms and shapes. Thus, for example, it is turned to a fixed, to a volatile, and to an intermediate substance, in the different preparations of diaphoretic ceruse, bezoar, mineral flowers, mercurius vitæ, glass of antimony, &c. from all which the *regulus* may not only be recovered again, but any one of them may likewise be converted into any other, or made to travel successively through all the various forms of the rest.

If the *regulus* of *antimony* be reduced to fine powder, and calcined in an open vessel, so as that the bottom may remain ignited for several hours, this is turned into a kind of grey powder.

And here there occurs a remarkable phenomenon, which has occasioned much speculation among chemists, viz. that the *regulus*, notwithstanding its constant evaporation, or sublimation, in the form of a fine fume, is found to gain in weight; so that, for example, if an ounce of the powdered *regulus* were thus committed to calcination, it becomes, at the end of the operation, heavier, by half a drachm, or a drachm, than it was at first; and this at the same time that it is contracted in its bulk. And, if the powder thus calcined be melted with a sufficient degree of heat, it turns to a kind of purple glass, somewhat purer than that prepared from common *antimony*.

If a quantity of charcoal, in gross powder, be added to this glass, and the method of reduction practised in a close vessel, with a fire of fusion continued about an hour, more or less, according to the quantity of the matter; when, after this, the vessel comes to be broken, the glass will be found reduced to metallic *regulus* again.

The use of ANTIMONY in regard to gold.

All the metals, except gold, are subject to an attenuated resolution by *antimony*; so that, if any thing of gold

be contained in the other metals, it may by this means be separated from them.

The separation, thus procured by *antimony*, *Becher* considers barely as the effect of gravity; on account whereof he thinks the *antimony* comes to resolve and collect together all the metals, which, being lighter than gold, continue to float above it.

But this opinion is not without difficulties. For, first, When nothing but pure gold is melted along with *antimony*, the *antimony* still lets go the gold in the same manner; though, by the supposition, it should only do this upon the mutual fusion of other metals along with the gold. Secondly, But the principal objection is, that gold will subside in *antimony*, without mixing at all considerably therewith; whilst the same *antimony* remains most tenaciously interpersed in the bodies of all other metals, where it does not act by its bare gravity alone, as we evidently see in the case of lead; for, if lead be found along with *antimony*, and little plates of silver be thrown into the melted mass, the lead will not, by that means, be precipitated, but rather the silver freely subsides into the *regulus*, which is no way touched by the *antimony*; whilst the *antimony* detains the lead, a matter whereto it may adhere more firmly than to silver.

It is however true in practice, that, when *antimony* is melted with iron; for instance, either alone, or according to other methods before mentioned, the iron thus subtilly dissolved may be brought to enrich the body of the silver, or to deposit a grain or two of gold therein; as may be discovered by adulterating the *scoria*, stratifying it with silver plate, and cementing them both together for some hours in a close vessel, the fire at length being so far increased as to make the matter flow for some hours longer; after which it is to be taken out, beat from its *scoria*, refined, and proved by the depart.

The reason of which effect proceeds hence, that the latent gold naturally contained in iron, being now very subtilly divided and diffused therewith, comes, in the course of this long continued fusion and ebullition, to be a thousand times tossed and agitated every where about therein, so as of necessity sometimes to infringe upon, and unite with, the particles of the silver, which now make part of the mixture; and, being once lodged among them, they cannot afterwards be touched either by the *antimony*, or the iron; so that the gold, thus defended, wants only for its manifestation to be perfectly separated from the *scoria*, and collected together in its natural form, by the proper operations for that purpose. See the article REFINING.

But it is also apparent at the same time, that the *scoria* here formed by the *antimony* corroded with the metal, when they come to be joined together, are lighter than the rest of the metal which remains corroded, and floats above it in the nature of scum.

The theory of *Becher*, therefore, may very well be admitted in this sense, that all metals, but gold, being corroded by *antimony*, that metal, on account of its superior specific gravity, falls to the lowest place.

This explanation may be further illustrated by the following experiment. To an ounce of melted silver, throw two ounces of *antimony*; and, when they have flowed very thin together, pour them out; upon which the *antimony* will be found at top, together with about a dram of the silver it has corroded, in the form of a spongy *scoria*, whilst the rest of the silver that is not thus dissolved, remains close and heavy, like *regulus*, at the bottom.

The ultimate refinement of gold is by fusing it thin with twice its own weight of *antimony*; wherein the *antimony* bears away, and imbibes the substance of all the other metals, but leaves the gold untouched; which, therefore, as the heavier body, falls like a *regulus* to the bottom of the melting cone. It is remarkable in this operation, that a very little portion of *antimony*, so little as can scarce alter the weight of the gold, adheres tenaciously to the surface thereof, and covers its native colour with a whiteness; whence it is commonly said, that the fume of the *antimony* here turns the gold white. The *regulus* is again to be purged from this accretion by the blast, which will drive the little additional matter off in *scoria*, or exhalation.

These

These are the chief uses wherein *antimony* is applied in metallurgy; and besides its medicinal uses, it is employed by several artificers to give the silver found to tin, in casting bells, making metalline specula, and types for printing, &c.

ANTIPODES, in *geography*, such inhabitants of the earth as live diametrically opposite to each other.

Thus, if a line was continued down from our feet through the center of the earth 'till it arrived at the surface on the other side, it would fall on the feet of our *antipodes*, and *vice versa*. Our *antipodes* have summer when we have winter, and winter when we have summer; day when we have night, and night when we have day; for as we have both the same horizon, the sun must rise to the one, when he sets to the other.

It was formerly looked upon as absurd and ridiculous to assert that there were people who walked with their feet towards ours, and the ancient fathers *St. Augustine* and *Laëtantius* strenuously denied it; but our voyages to the East-Indies, the South-Sea, and other parts of the world, have sufficiently demonstrated the existence of the *antipodes*.

ANTISCHII, in *geography*, are those inhabitants of the earth which live in two places under the same meridian equally distant from the equator; the one on the north, and the other on south-side thereof.

Therefore the one will have summer, when the other has winter; and *vice versa*; and when the days are longest with the one, they are shortest with the other. And because they have both the same meridian, it will be noon, midnight, &c. with both at the same time.

ANTOECCI, in *geography*, are the inhabitants of the earth, which live under the same semicircle of the same meridian, but on different sides of the equator, viz. the one north, and the other south; and at equal distances from that circle.

These have noon and midnight, and all hours at the same time, but contrary seasons of the year; that is, when it is spring with the one, it is autumn with the other; when summer with the one, winter with the other. And the days of the one are equal to the nights of the other, and *vice versa*.

ANTRIM, in Ireland, is sufficiently fruitful, and is one of the five counties that are fully employed or embarked in making linnens; its chief town *Carrickfergus* (or *Knockfergus*) is very rich, populous, and a place of good trade, being commodiously situated for it on a bay of the name, with an excellent fine harbour; to which we may add *Bellfast*, about eight miles distant, seated at the mouth of *Lagen-Water*, which is a thriving town, and daily improving, having had three hundred and seventy-five of vessels (with 9180 tons) appertaining to it in 1723.

ANTWERP, a remarkable city in the Netherlands, on the river *Schelde*, and the capital of the province, called the marquisate of the holy empire.

Though the trade of this city is still very considerable, it certainly is at present but the shadow of that which flourished there formerly. The stately and famous house of the *Easterlings*, or as the natives call it, of the *Oosterlinghen*, shews the extent of that trade. It was built in the year 1568, for the convenience of the merchants coming from the Baltic. It is a square stone building, 250 feet broad, with warehouses on the top for dry goods, and cellars below for wet. In the middle story, which has a gallery quite round the square, are 300 lodging rooms for merchants. But now this noble structure is turned into a horse-barrack; the cellars serve for stables, and the rooms above for hay-lofts. The vast warehouses in that building, which are perhaps the largest in the world, wherein each nation deposited their merchandizes, will be an everlasting testimony of that extensive commerce, which, though divided between Amsterdam, Rotterdam, and the other trading towns of the United Provinces, is yet sufficient to enrich them all, and give them the reputation of driving the greatest trade in Europe.

There are kept at *Antwerp* several free fairs, which draw thither merchants from all parts. The most considerable of these fairs are those kept at *Whitsuntide*, and between the festivals of *St. Remigius* and *St. Bavo*.

The bleaching-grounds in the neighbourhood of this city are in very great repute; and the opinion people have, that the waters of the little river *Schenith* are more proper than any others for the bleaching of linnen, is the reason why they send linnens thither from the remotest parts of the Austrian Netherlands.

The manufactories of wrought tapestries are very famous.

They also continue to excel here in the art of printing; and though it be certain that this art is much decayed here since the famous *Plantin*, who had almost brought it to a degree of perfection, yet it is certain that the printers of *Antwerp* are not unworthy to be styled the successors of so great a man.

The most considerable manufactory established at *Antwerp*, and which chiefly supports its trade, is that of *thread-lace*, so well known every where under the name of *Mechlin-lace*. It is hardly possible to imagine what vast quantities France and Holland buy yearly of this commodity, as well as of all sorts of thread, the spinning of which is excellent in this city, and in its neighbourhood. The merchandizes which foreigners, and especially the French and the Dutch, send thither, and which sell best, are,

All sorts of gold, silver, and silk stuffs; broad cloths, and other woollen stuffs; spices, pot-ashes and lees; wines and brandies; salt from France, Spain, and Portugal; herrings and stockfish; oil of olives, train oil, and seeds; painted linnens and muslins; sugars, either refined, or in powder.

There are two sorts of money, both at *Antwerp*, and throughout all *Brabant* and *Flanders*; or rather it is the same under different denominations. The one is called money of exchange, and the other current money.

According to this distinction, the *patagon*, or *rix-dollar*, is worth eight *schellingen*, or forty-eight *stivers*, exchange-money, and but seven *schellingen* current-money: and a pound grofs of six *guldens* exchange-money, makes seven *guldens* current-money: so that you must pay 116 *guldens*, and $\frac{2}{3}$ current-money to make 100 *guldens* exchange-money; and 116 pounds grofs and $\frac{2}{3}$ current-money to make 100 pounds grofs exchange-money.

Merchants keep their accounts at *Antwerp* in pounds, *schellings*, and groots grofs Flemish. The pound grofs is of twenty *schellings*, and the *schelling* twelve groots; the groot is half a *stiver*.

The pound at *Antwerp* is about five per cent. lighter than that of *Amsterdam* and *Paris*: so that 100 pounds weight at *Antwerp* make 95 and $\frac{1}{2}$ in those two cities; and 100 pounds of these two cities make 105 pounds at *Antwerp*.

As for long measure, 100 ells at *Antwerp* make 101 $\frac{1}{2}$ at *Amsterdam*; and 100 ells of *Amsterdam* make 98 $\frac{6}{7}$ at *Antwerp*, or very near 98 $\frac{1}{2}$.

They draw from *Amsterdam* upon *Antwerp*, and from *Antwerp* upon *Amsterdam*, in pounds grofs, and in *guldens*, commonly at a few day's date, and sometimes at one or two usances, or months. The exchange is often at par, and oftener still at two or three per cent. loss for *Antwerp*.

ANVIL, a large mass of iron, used by several handicrafts, who work and forge, or hammer metals, particularly by the silversmiths, blacksmiths, locksmiths, farriers, armourers, &c. There are two sorts of anvils: some are forged, and others cast; the former are made by the blacksmiths, and the latter are cast in the foundaries. The best are those which are hammered, and the upper part of which is steel.

Anvil-smith, a boy designed for this trade needs only the common education of reading, writing, and arithmetic, and no great mental abilities are necessary; the whole secret of the art consisting in the just knowledge of tempering the steel he uses. It however requires a considerable degree of strength.

The *anvil-smith* makes anvils, hammers, &c. for the workers in metals. These are made of iron faced with case-hardened steel, well polished, according to the nature of the work for which they are designed. The fums given with an apprentice are from five to 20 l. It is a very profitable business for the master, and like common smith's work to the journeyman.

APENZEL, is the principal town of the Canton in Switzerland, named therefrom, which is very rich in meadows and pasturage, fitly adapted to the breeding of many cattle, in which this territory abounds; they also grow here a great deal of hemp and flax, which serves the inhabitants for a winter's employ in making linnens, sold afterwards to St. Gall, but little distant herefrom.

APHRONITRE, a kind of natural salt-petre, gathering, like an efflorescence, on old walls, now commonly called salt-petre of the rock. See **SALT-PETRE**.

APIARY, a place where bees are kept, furnished with all conveniences necessary for that purpose. It should be sheltered from high winds on every side, and well defended from poultry, &c. whose dung is offensive to bees.

APOCYNUM, *dogs-bane*. This genus of plants is, by Mr. Ray, placed in his eighteenth class, intitled, "Herbs with many seed-vessels succeeding each flower." Doctor Tournefort ranges it in his first "class of plants, with a monopetalous bell-shaped flower, whose pointal changes into a fruit composed of several sheaths, or husks." Doctor Linnæus places it in the second division of his fifth class of plants, intitled, "Pentandria Digynia."

In the native country of their growth, these plants are generally found in woods, where they twist themselves about the neighbouring trees, and climb to the height of thirty or forty feet. They produce their flowers in July, and their seeds ripen in January following.

The down, which adheres to all the species of *dogs-bane*, is very soft and elastic; so that if it be pressed close together, no sooner is the weight removed from it, but it expands to its former bulk. This is much used in France for stuffing of cushions and pillows, being extremely light and soft. It is there called *de la Wade*. In England it hath been much used for quilts, being very proper for persons who are troubled with the gout, who cannot bear any weighty covering over them; this being very warm, yet so light as not to be felt, or occasion any pain. But as this down cannot be had in large quantities from English growth, so those persons who are desirous to have it, must procure it from America, where several species do grow in great plenty.

APOCHYLISMA, in *pharmacy*, the juice of vegetables extracted and inspissated, answering to the official word *rob*.

APOSTOLORUM unguentum, in *pharmacy*, a vulnerary ointment, so called from its being composed of twelve ingredients, the number of the *apostles*.

APOTHECARY, one who practises the art of pharmacy, which is that part of physic consisting in the choice, the due preparation, and mixture of medicines.

This is a very genteel business, and has been in great vogue of late years, there being, as has been computed, upwards of 1000 in and about London. There are, in this profession, various degrees, as to employ and extent.

Some do little else but make up medicines, according to the prescription of the Dispensatory (compiled by the order of the College of Physicians, for their direction) and those of particular physicians, besides visiting their patients.

Others not only prepare almost all kinds of medicines, as well *galenical* as *chemical*, but likewise deal in drugs; with all which they supply their brethren in trade, and so become a sort of wholesale dealers, as well as *apothecaries*.

Others, again, practise surgery, man-midwifry, and, many times, even officiate as physicians, especially in the country, and often become men of very large practice, and eminent in their way. There is another branch, also, many of them fall into, which is that of curing lunatics, &c.

If the *apothecary*, according to the original of that profession, only mixes medicines as directed by the doctor's bill, it requires only a slight knowledge of the Latin tongue, with the names of the several drugs, and the art of compounding them: but if he be considered as performing the office of the physician and the surgeon, in prescribing to patients, his natural abilities ought to be

the same with those of the doctor, and his education almost equally liberal. He should have a genteel person and behaviour; for one who has naturally the clumsiness, the walk, the air, or the blunt rudeness of a plowman, can never be fit for this genteel profession. The youth who desires to be an *apothecary* should also have a clear head, a retentive memory, great readiness of address, an obliging disposition, and a compassionate heart. He should before he goes apprentice be well versed in the learned languages, particularly in Latin; and before he is out of his time should become acquainted with anatomy, botany, and chemistry, and not only know the names, but the qualities of drugs. Where this is the case, he may be considered as a physician who mixes up his own medicines, and acts without a diploma.

Let the parent then who designs to make his son an apothecary, give him an early and liberal education; and it is proper that in the course of his apprenticeship, or before he sets up for himself, he should attend some anatomic, botanic, and physical lectures, at least for two seasons. I would also advise him to begin, while an apprentice, to take private memorandums, for his own future use, of the cases that fall within his notice, the medicines administered, and their success upon the patient. And thus he will be enabled to rely on his own judgment: but instead of being in great haste to set up for himself, it is most advisable, even though he has a considerable fortune to begin with, to serve a few years as a journeyman under a master of great reputation and practice; by which means he will increase his knowledge, and become better qualified for the humane and noble employment of administering health to the sick. One of the most essential qualities of a good *apothecary* is, that he should be naturally of a compassionate disposition: this, which is his duty, will contribute to his success in business, and his making a figure in life. Let his behaviour on all occasions be mild and obliging. Let him attend the poor without a prospect of gain; and, with respect to the rich, instead of swelling his bills by enormous doses, and pompous unavailing recipes, it is much more honest and humane, to charge the medicines in his bill at such a price as will sufficiently pay for his skill and attendance.

The sums given with the youths who go apprentice to this business are from 20 l. to 100 l. according to the station and reputation of the master. A journeyman has from 10 l. to 40 l. a year, and his board; and he may set up with 100 l. But he ought to have money to maintain him till he gets a good set of patients. An *apothecary* endowed with the least degree of honesty will always have the best drugs that can be purchased; since on their goodness depend the health, and even the lives, of his patients.

In London they are one of the city companies, and were first incorporated with the grocers in the year 1606, in the reign of king James I. but not alone 'till 1617.

They have a hall, where there are two fine laboratories, out of which all the surgeons chests are supplied with medicines for the use of the royal British navy.

In the year 1712, the tenth of queen Anne, an act passed for reviving and continuing several acts therein mentioned, one whereof was for exempting the *apothecaries* from serving the offices of constable and scavengers, and other parish and ward-offices, and from serving on juries: which act was made perpetual in the ninth year of George I.

The *apothecaries* in England are obliged to make up their medicines according to the form prescribed in the Dispensatory of the College of Physicians, and are under an obligation to have those there enumerated always ready in their shops; and their shops are liable to be visited by the censors of the college, who have it in their power to destroy such medicines as they judge not to be good.

Apothecaries to the army are to make up their chests of medicines at *Apothecaries-hall*, there to be openly viewed, &c. under the penalty of 40 l. *Stat. 10 Ann. cap. 14. 10 Geo. 1.*

APPARATOR, or **APPARITOR**, a messenger that serves the process of the Spiritual-court: his duty is to

cite the offenders to appear; to arrest them; and to execute the sentence or decree of the judges, &c. *Stat. 21 Hen. VIII. cap. 5.*

If a monition be awarded to an *apparitor*, to summon a man, and he upon the return of the monition avers that he had summoned him, when in truth he had not, and the defendant be thereupon excommunicated; an action on the case at common law will lie against the *apparitor* for the falsehood committed by him in his office, besides the punishment inflicted on him by the ecclesiastical court for such breach of trust. *Ayl. Parerg. 70. 2 Bull. 264.*

Action upon the case, for that the defendant an *apparitor* under the bishop of Exeter, maliciously, and without colour or cause of suspicion of incontinency, of his own proper malice, procured the plaintiff *ex officio*, upon pretence of fame of incontinency with one *Editb* (whereas there was no such fame nor just cause of suspicion) to be cited to the Consistory-court, and there to be at great charges and vexation, until he was cleared by sentence; which was to his great discredit, and cause of great expence and losses; for which the action is brought. Upon Not Guilty pleaded, and found for the plaintiff, it was moved in arrest of judgment, that in this case an action lieth not; for he did nothing but as an informer, and by virtue of his office. But all the court held, forasmuch as it is alleged, that he did maliciously and without colour of suspicion cause him to be cited, upon pretence of fame where there was no offence committed; and it is averred, that there was not any such fame, and he is found guilty thereof, therefore the action well lieth. *Cro. Car. 291.*

APPEAL, is frequently used for the removal of a cause from an inferior court or judge to a superior. *Cowell.*

APPEALS, *about prizes.* His majesty, *Geo. II.* in order to bring *appeals* from sentences in causes of prizes, pronounced in the courts of Admiralty, to a speedy determination, did, by his commission, bearing date the 11th of July, in the twenty-second year of his reign, revoke a former commission, granted to all his majesty's then privy-counsellors, and all other his privy-counsellors for the time being, during pleasure; and did also by the same commission, appoint all his privy-counsellors then being, as also Sir Thomas Parker, knight, lord chief baron of the Exchequer; Sir Martin Wright, Sir Thomas Dennison, and Sir Michael Foster, knights, justices of the court of King's-bench; Sir Thomas Abney, Sir Thomas Burnet, and Sir Thomas Birch, knights, justices of the court of Common-pleas; Charles Clark, Edward Clive, and Heneage Legge, esquires, barons of the court of Exchequer, and the chief baron of the Exchequer, for the time being, to be commissioners for hearing and determining such *appeals* during pleasure, &c. And as some objections have been raised, against the last mentioned commission, on account of the lord chief baron of the Exchequer, the justices of the King's-bench and Common-pleas, and the barons of the Exchequer, who were not of the privy-council, being joined therein; It is therefore enacted, That the said commission, and all the powers granted therein, shall be deemed good in law; and the commissioners, as well as the said lord chief baron, and the said justices and barons therein named, and the lord chief baron of the Exchequer, and the justices of the King's-bench and Common-pleas, and the barons of the Exchequer for the time being, although they should not be of the privy-council, are empowered, during his majesty's pleasure, to receive and determine all such *appeals*, and to use all other jurisdictions, according to the true intent of the said commission.

No sentence, upon the hearing of any such *appeal*, shall be valid, unless a majority of the commissioners present be of the privy-council.

APPIOS, the seed of a plant that comes from the Levant, particularly from the isle of Candia. Its stalks are very thin, and reddish: its blossoms are pretty much like those of rice. Its seed, which is very small, is one of the commodities sold by the wholesale grocers in France and Holland.

Appios pays in France fifty sols duty of importation per 200 weight.

APPLES. A duty is laid on all *apples* imported into Great-Britain, to be paid before landing thereof, by *statute 10 Geo. II. cap. 27.*

APPOSALS of *sheriffs.* The charging them with money received upon their accounts in the Exchequer. It is used in *stat. 22, and 23 Car. II.*

APPRAISER: The *appraising-business* is generally joined to that of the upholsterer, and of the brokers in household goods; and they are called *sworn appraisers*, from their having taken an oath to do justice between the parties who employ them. As none are then taken apprentice merely to the business of *appraising* goods, we need not mention the qualifications of a youth to fit him for it. We shall only observe, that the *appraiser* ought to join to a good deal of experience in the value of goods of all kinds, great integrity and impartiality. Those of this business are employed in cases of death; executions brought upon goods, or of stock to be turned over from one person to another, or divided between partners. They sometimes *appraise* jointly, each party agreeing to have the same *appraiser* or *appraisers*; sometimes, in opposition, each party choosing one or more of a side, and sometimes, by commission, or deputation of trustees, masters in chancery, &c. In these cases each of them takes a particular inventory of the goods, with the value of each; and when they have gone through the whole, they give their estimates in a gross sum. When different *appraisers* value against others, if they happen to differ much, they re-consider, and at length commonly come to an agreement. They generally value every thing very low, not out of respect to any of the parties, but because they are obliged to take the goods, if it is insisted on, at their own *appraisement*, and great part must inevitably lie upon their hands as dead stock; consequently if they give nearly the value they are of to the consumer or user, they must be losers. *Stat. 13 Edw. I.*

APPRENTICE, signifies with us one that is bound in word or writing, to serve another man of trade for certain years, upon condition that the artificer or master shall in that mean time endeavour to instruct him in his art or mystery. *Smith de Rep. Ang. lib. iii. cap. 8.* saith, They are a kind of bondmen, differing only, that they are servants by covenant, and for a time.

Who are capable of binding themselves apprentices:

It is said, that if a married man and his wife do bind themselves to serve, they shall be compelled thereto, according to their covenant or agreement; and that if a woman who is a servant shall marry, yet she must serve out her time; and her husband cannot take her out of her master's service. *Dalt. c. 58.*

It seems clearly agreed, that by the common law infants, or persons under the age of twenty-one years, cannot bind themselves *apprentices*, in such a manner as to intitle their masters to an action of covenants, or other action for departing from their service, or other breaches of their indentures; which makes it necessary, according to the usual practice, to get some of their friends to be bound for the faithful discharge of their offices, according to the terms agreed on. *11 Co. 89. b. 2 Inst. 379, 580. 3 Leon. 63. Faresl. 15.*

But by the *5 Eliz. cap. 4. sect. 42, 43*, it is enacted in the words following. "And because there hath been, and is some question and scruple moved, whether any person being within the age of twenty-one years, and bounden to serve as an *apprentice* in another place than in the said city of London, shall be bounden, accepted, and taken as an *apprentice*; for the resolution of the said scruple and doubt, be it enacted by the authority of this present parliament, that all and every such person or persons, that at any time or times from henceforth shall be bounden by indenture to serve as an *apprentice* in any art, science, occupation, or labour, according to the tenour of this statute, and in manner and form afore said, albeit the same *apprentices*, or any of them, shall be within the age of twenty-one years at the time of making their several indentures, shall be bounden to serve for the years in their several indentures contained,

as amply and largely to every intent, as if the same apprentice were of full age at the time of making such indentures; any law, &c."

But notwithstanding this statute, it hath been held, that an action of covenant is against an apprentice, for departing from his master's service without licence, within the time of his apprenticeship; where the defendant pleaded, that at the time of making the indenture he was within age; and on demurrer to this plea, it was argued, that this indenture should bind the infant, because it was for his advantage to be bound apprentice, to be instructed in a trade; it was also urged, that he was compellable by 5 *Eliz. supra*, to be bound out an apprentice; but all the court resolved, that although an infant may voluntarily bind himself an apprentice, and if he continue an apprentice for seven years, he may have the benefit to use his trade; and yet neither at the common law, nor by any words of the above-mentioned statute, a covenant or obligation of an infant, for his apprenticeship, shall bind him; but if he misbehave himself, the master may correct him in his service, or complain to a justice of peace, to have him punished, according to the statute; but no remedy lieth against an infant upon such covenant. *Cro. Car. 179. Cro. Jac. 194. S. P.*

By the custom of London, an infant unmarried, and above the age of fourteen, may bind himself apprentice to a freeman of London, by indenture with proper covenants; which covenants, by the custom of London, shall be as binding as if he were of full age. *Moor. 134. 2 Bulst. 192. 2 Roll. Rep. 305. Palm. 361. 1 Mod. 271. 2 Keb. 687.*

Manner of binding, and who are compellable to be bound apprentices; and of settling differences between masters and apprentices.

A person cannot be bound an apprentice without deed. *1 Salk. 68.*

And an apprentice must be retained by the name of an apprentice expressly, otherwise he is no apprentice, though he be bound. *Dalt. c. 58.*

And as an apprentice can only be bound by deed, so it is necessary, according to the custom of some places, that such deed or indenture be inrolled; as in London, if the indentures be not inrolled before the chamberlain within a year, upon a petition to the mayor and aldermen, &c. a *fiere fac'* shall issue to the master, to shew cause why not inrolled; and if it was through the master's default, the apprentice may sue out his indentures, and be discharged; otherwise, if through the fault of the apprentice, as if he would not come to present himself before the chamberlain, &c. for it cannot be inrolled, unless the apprentice be in court and acknowledges it. *2 Roll. Rep. 305. Palm. 361. 1 Mod. 271.*

But it hath been held, that this custom does not extend to one bound 'prentice to a waterman, under twenty-one years of age; for the company of watermen are but a voluntary society, and being free of that does not make one free of London. *6 Mod. 69.*

By the statute 5 *Eliz. cap. 4. sect. 25.* an apprentice must be bound by deed indentured.

An action was brought against the defendant, for enticing away and detaining the plaintiff's apprentice, who had agreed by writing to serve the plaintiff for seven years. Upon evidence it appeared, that the stile of the writing began, "This indenture, &c." but, in fact, the parchment was not indentured, but was a deed poll. On exception taken to the deed, it was insisted that the young man was not an apprentice, because he was not bound by indenture. An infant can be bound no other way than as the statute of 5 *Eliz.* directs, which is by indenture, and nothing can make this good. This deed cannot now be indentured, for that would be forgery. Therefore unless the plaintiff shews the apprentice to be of full age at the time of signing such deed, he cannot be accounted his apprentice, and by consequence no action can lie for detaining the apprentice; neither can the plaintiff prove him to be his servant by this deed, for he has declared for an apprentice, and must prove him so to be. Therefore the plaintiff was nonsuited. *Seff. Ca. vol. i. 222.*

By *stat. 5 Eliz. cap. 4. sect. 39, 41.* all indentures, covenants, promises, and bargains, for having or taking

apprentices otherwise than by the statute of 5 *Elizabeth*, shall be clearly void in the law to all intents and purposes; and every person that shall take any apprentice contrary to the said act, shall forfeit 10*l.* half to the king, and half to him that shall sue in the sessions, or other court of record; or if it is in a town corporate, then to the use of such town as by the charter.

By the several stamp acts, the binding (except it be of parish apprentices) shall be on a two shilling and six-penny stamped paper or parchment; and the same shall not be given in evidence in any court till it be stamped, and the duties paid.

And by the *stat. 8 Ann. cap. 9. sect. 32.* besides the said stamps and duties, there shall be paid the duty of sixpence for every 20*s.* of every sum of 50*l.* or under; and the duty of one shilling for every 20*s.* of every sum above 50*l.* given with any apprentice; and proportionably for greater or lesser sums; to be paid by the master.

And by *sect. 45.* of the same statute, where any thing, not being money, shall be given with such apprentice, the duties shall be answered for the value thereof.

But by *sect. 48.* this shall not extend to any apprentice, put out at the common charge of any parish or township, or out of any public charity.

Sect. 35. The full sum shall be inserted in the indenture in words at length, and shall bear date on the day of the execution thereof; on pain that the master forfeit double, half to the king, and half, with full costs, to him that shall sue.

Sect. 36. The said indentures, within the bills, shall be brought to the head office to be stamped with a stamp for that purpose, and the duties paid within one month after date.

Sect. 37. And in other places, the said indentures shall be brought either to the head office within the bills, or to a collector of the stamp duties out of the said limits, in two months after date, and the duties thereupon shall be paid, and the indenture stamped, if it be at the said head office; otherwise such collector shall indorse on the indenture, a receipt for the duties in words at length, and subscribe his name thereto.

Sect. 38. And if it is within fifty miles of the limits of the bills of mortality, the indenture shall within three months after date, and elsewhere within six months, be brought to the head office to be stamped.

Sect. 39. And all such indentures, wherein shall not be inserted the full sum directly or indirectly given, or whereupon the duties shall not be paid, or which shall not be stamped within the time limited, shall be void, and not available in any court or place, or to any purpose whatsoever; and the apprentice shall be incapable of exercising the said trade.

Sect. 43. And no such indenture shall be given in evidence in any suit to be brought by any of the parties thereunto, unless such party on whose behalf the same shall be given in evidence, do first make oath, that to the best of his knowledge, the sum therein inserted was really and truly all that was directly or indirectly to be given with such apprentice.

By the *stat. 9 Ann. cap. 21.* If the master shall neglect to pay the duties within the time limited, he shall forfeit 50*l.* half to the king, and half, with full costs, to him who shall sue.

And by the *stat. 18 Geo. II. cap. 22. sect. 23, 24.* If he shall neglect to pay the same as aforesaid, he shall, besides all other penalties, forfeit double duty.

But by the *stat. 30 Geo. II. cap. 19.* For the relief of persons who have omitted to pay the said duties, or to insert the said sums in words at length; upon payment of the said duties on or before September 1, 1757, and tendering the indentures to be stamped at the same time, or at any time on or before September 29, 1757, (of which timely notice shall be given in the gazette) the said indentures shall be good and valid, and may be given in evidence.

And there is the like indemnifying clause in some act every two or three years.

By the 20 *Geo. II. cap. 45. sect. 5.* If any master, having forfeited the double duty, shall pay the same, and tender the indenture to be stamped within two years after

the determination of the *apprenticeship*, and before suit hath been commenced for the penalties, the indenture shall be valid, and the penalties discharged.

Seet. 6, 7. And if after the master shall have forfeited the double duty, the *apprentice* shall in the presence of, or by writing under his hand signed in the presence of one witness, require his master to pay the same, and the master shall not do it in three months; and such *apprentice* shall, at any time within two years after the determination of his *apprenticeship*, pay the double duty, he may in three months after such payment, demand of his master, double the sum contracted for in the indenture; and if not paid in three months after, may recover the same by action at law, with full costs. And the *apprentice* immediately after payment of the same double duties, (if his *apprenticeship* shall not be then expired) signifying by writing under his hand, that he desires to be discharged from his *apprenticeship*, shall be discharged accordingly, and shall have the same benefit of the time he hath served as he would have had in case he had been assigned, or turned over to a new master.

Seet. 8. And where any prosecution shall be commenced against the master for the penalties, if the *apprentice* shall pay the double duty at any time in two years after the end of his *apprenticeship*, he may thereupon exercise his trade, and the indenture shall be valid, and may be given in evidence.

As to compelling persons to be bound *apprentices* by *statute 5 Eliz. cap. 4. seet. 35.* it is enacted, "That if any person shall be required by any householder, having and using half a plow-land at the least in tillage, to be an *apprentice*, and to serve in husbandry, or in any other kind of art, mystery, or science before expressed, and shall refuse so to do, that then, upon complaint of such house-keeper, made to one justice of the peace of the country where the said refusal is or shall be made, or of such householder inhabiting in any city, town corporate, or market-town, to the mayor, bailiffs, or head officer of the said city, town corporate, or market-town, if any such refusal shall be there, they shall have full power and authority by virtue hereof, to send for the same person so refusing; and if the justice, or the said mayor or head officer, shall think the said person meet and convenient to serve as an *apprentice* in that art, labour, science, or mystery, wherein he shall be so then required to serve, that then the said justice, or the said mayor or head officer, shall have power and authority by virtue hereof, if the said person refuse to be bound as an *apprentice*, to commit him unto ward, there to remain until he be contented, and will be bounden to serve as an *apprentice* should serve, according to the true intent and meaning of this present act; and if any such master shall misuse or evil treat his *apprentice*, or that the said *apprentice* shall have any just cause to complain, or the *apprentice* do not his duty to his master, then the said master, or *apprentice*, being grieved, and having cause to complain, shall repair unto one justice of peace within the said county, or to the mayor or other head officer of the said city, town corporate, market-town, or other place where the said master dwelleth, who shall, by his wisdom and discretion, take such order and direction between the said master and his *apprentice*, as the equity of the cause shall require; and if for want of good conformity in the master, the said justice of peace, or the said mayor or head officer, cannot compound and agree the matter between him and his *apprentice*, then the said justice, or the said mayor or other head officer, shall take bond of the said master to appear at the next session then to be holden in the said county, or within the said city, town corporate, or market-town, if the said master dwell within any such; and upon his appearance, and hearing of the matter before the said justices, or the said mayor or other head officer, if it be thought meet unto them to discharge the said *apprentice* of his *apprenticeship*, that the said justices, or four of them at least, whereof one of them to be of the *quorum*, or the said mayor or other head officer, with the consent of three other of his brethren, or men of best reputation within the said city, town corporate, or market town, shall have power, by authority hereof, in writing under their hands and seals, to pronounce and declare, that they have discharged the

said *apprentice* of his *apprenticeship* and the cause thereof; and the said writing, so being made and enrolled by the clerk of the peace, or town-clerk, amongst the records that he keepeth, shall be a sufficient discharge for the said *apprentice* against his master, his executors and administrators, the indenture of the said *apprenticeship*, or any law or custom to the contrary notwithstanding; and if the fault shall be found to be in the *apprentice*, then the said justices, or the said mayor or other head officer, with the assistance aforesaid, shall cause such due correction and punishment to be ministered unto him, as by their wisdom and discretion shall be thought meet."

Seet. 36. "Provided, That no person shall by force or colour of this statute, be bounden to enter into any *apprenticeship*, other than such as be under the age of twenty-one years."

By the *stat. 43 Eliz. 2. cap. 5.* it is enacted, "That it shall be lawful for the churchwardens and overseers of the poor, or the greater part of them, by the assent of any two justices of the peace, to bind poor children *apprentices* where they shall see convenient, till such man-child shall come to the age of twenty-four years, and such woman-child to the age of twenty-one years, or the time of their marriage; the same to be as effectual to all purposes, as if such child were of full age, and by indenture of covenant bound him or herself."

By the *statute 1 Jac. I. cap. 25. seet. 23.* this last mentioned act is continued, with this further addition, "That all persons to whom the overseers of the poor, shall, according to this act, bind any children *apprentices*, may take and receive and keep them as *apprentices*; any former statute to the contrary notwithstanding."

It hath been held, that by the said *statute 5 Elizabeth*, the justices of the peace might bind a poor person to husbandry against the consent of his master; but that neither by that statute, nor the *statute 43 Elizabeth*, which impowers the churchwardens, &c. to raise a stock of money, by way of assessment on the parish, for that purpose, they could impose an *apprentice* on a tradesman against his consent, but must assess and raise money to bind him out. *Raym. 65, 177. 1 Sid. 99. 1 Lev. 84. 1 Vent. 325. 8. P. cont. Carth. 94. Comb. 165. 3 Mod. 269. 1 Show. 76.*

As by the *statute 5 Elizabeth*, the justices of peace have a power of imposing an *apprentice* on a master, in consequence thereof an indictment lies for disobedience to their orders, either in not receiving, or receiving, and after turning off, or not providing for such *apprentice*; for though an act of parliament prescribes an easier way of proceeding by complaint, yet that does not exclude the remedy by indictment. *6 Mod. 163. 1 Salk. 381.*

The justices of peace may discharge an *apprentice* not only on the default of the master, but also on his own default; but it hath been holden, that their jurisdiction herein extends only to such *apprentices* as were bound to trades within the statute, and were compellable by them to serve; for that in such case it is but reasonable that the contracts which were made by their authority, should be dissolved by the same power; but that they cannot discharge any voluntary agreements made between the parties. *Skin. 108. 5 Mod. 139. 2 Salk. 471.*

Therefore where an order of sessions was made to discharge a surgeon's *apprentice* from his master, for not instructing him in the art of surgery; but the master being a mountebank, kept the *apprentice* for a tumbler on the stage; the order was quashed for want of jurisdiction in the justices, because a surgeon is not one of the trades mentioned in the *5 Eliz.* and here it was held, that the justices have power only over such *apprentices* who are bound to the trades therein named, and not over *apprentices* to other trades. *Carth. 366. 5 Mod. 138. 2 Salk. 471.*

And yet it hath been resolved, that the justices may not only discharge a merchant's *apprentice*, (which has been agreed not to be a trade within the *statute 5 Eliz.*) but also oblige the master to refund part of the money which he had with him; and this doctrine of refunding seems to be now established, as founded on great reason, though not expressly mentioned in the act; for the justices being authorized to discharge according to their discretions, where the end of the *apprenticeship* cannot be attained with one person

person, it is but justice the master should return part of the money he has received with his *apprentice*, to place him out with a new master. 1 *Sand.* 314. 1 *Salk.* 67. *Skin.* 108.

The order of discharge must be under the hands and seals of the justices, according to the express appointment of the statute; but it is said, that in a *certiorari* to remove the order, it is sufficient in the return to take notice of the order so made; for it is not necessary to certify the discharge itself. 1 *Sand.* 316. *Carth.* 199. *Comb.* 344.

It hath been held, that an order on the master to return money is good, though it is not averred that he had any with the *apprentice*; for the order being to return money, is as necessary a proof of the receipt of it, as if it had been expressly alledged; and in this case the court seemed to be of opinion, that the justices had jurisdiction as to discharging and obliging the master to refund, as well in other trades as those mentioned in the statute; and that the justices are not obliged in their orders to set forth all the steps they take in their proceeding, there being nothing in the act which makes it necessary, and that there was a known and established distinction between orders and convictions. *Trin.* 7 *Geo.* II. in *B. R.* The king v. *Amies*.

It hath formerly been held, that the sessions cannot make an original order of discharge; but that, according to the statute, the parties ought first to apply themselves to a justice of peace; and if he cannot compound the matter, then he is to bind the master to appear at the next sessions; but it hath been ruled of late, [see the preceding case] and it seems now established, that an order on an original application is good, and that the previous application to the justice is only discretionary. 1 *Sand.* 316. *Carth.* 198. 1 *Salk.* 68. 5 *Mod.* 138.

If the master, being bound to answer at the sessions, does not appear, it is a forfeiture of his recognizance; but yet at the same time the justices may proceed to make an order against him. 1 *Salk.* 67.

An order reciting, that *Joseph Higgin* was bound out by indenture, as the statute requires, to *John Parks*, and being lame, and having the king's evil, and, in the opinion of surgeons incurable; therefore the justices discharged the master from his *apprentice*. It was moved to confirm the order, because the master cannot now have the end of the binding, which was the service of his *apprentice*; but it was answered, that the statute only empowers the justices to discharge for misbehaviour, and not for sickness, and quashed by the court; for the master takes the *apprentice* for better and worse, and is to provide for him in sickness and health. *Strange* 99. *Trin.* 4 *Geo.* I.

An *apprentice* was discharged, the master having used him unkindly, and refused to provide for and entertain him; but by the court, This is not a good ground for the discharge; for there is a power to oblige the master to receive and entertain the *apprentice*, and using him unkindly is to lose. *Strange* 1014.

Statute 20 *Geo.* II. cap. 19. *sect.* 3. It shall be lawful for any two or more justices, upon any complaint or application by any *apprentices* put out by the parish, or any other *apprentice*, upon whose binding out no larger a sum than five pounds were paid, touching or concerning any misusage, refusal of necessary provision, cruelty, or other ill treatment of or towards such *apprentice*, by his or her master or mistress, to summon such master or mistress to appear before such justices at a reasonable time to be named in such summons; and such justices shall and may examine into the matter of such complaint; and upon proof thereof made upon oath to their satisfaction, (whether the master or mistress be present or not, if service of the summons be also, upon oath, proved) the said justices may discharge such *apprentice*, by warrant or certificate under their hands and seals; for which warrant or certificate no fees shall be paid.

Seet. 4. And such justices, upon application or complaint made, upon oath, by any master or mistress against such *apprentice*, touching or concerning any misdemeanor, mis carriage, or ill behaviour, in such his or her service (which oath such justices are hereby empowered to administer) shall hear, examine, and determine the same, and punish the offender by commitment to the house of correction, there to remain and be corrected, and held to hard labour for a reasonable time, not exceeding one calendar

month, or otherwise shall discharge such *apprentice*, in manner and form before-mentioned.

Seet. 5. Persons aggrieved by such determination, order, or warrant of such justice or justices as aforesaid (save and except any order of commitment) he, she, or they may appeal to the next general quarter sessions of the peace to be held for the county, riding, liberty, city, town corporate, or place where such determination or order shall be made; which said next general quarter sessions is hereby empowered to hear and finally determine the same, and to give and award such costs to any of the respective persons appellant or respondent, as the said sessions shall judge reasonable, not exceeding forty shillings; the same to be levied by distress and sale, in manner before-mentioned.

Seet. 6. And no *certiorari* shall issue or be issueable to remove any proceedings whatsoever, had in pursuance of this act, into any of his majesty's courts of record at Westminster.

Who may take, and are compellable to receive and provide for apprentices; of refunding the money given with them, and delivering up their indentures.

Stat. 5 *Eliz.* cap. 4. *sect.* 25. Every person being an householder, and having and using half a plough-land in tillage, may take any *apprentice* above the age of ten years, and under eighteen, to serve in husbandry till twenty-one at the least, or till twenty-four, as the parties can agree.

Seet. 26. Every person being an householder, and twenty-four years old at least, dwelling in any city or town corporate, and exercising any art, mystery, or manual occupation there, may retain the son of any freeman, not occupying husbandry, nor being a labourer, and inhabiting in the same, or in any other city or town corporate, to serve and be bound as an *apprentice* after the custom and order of the city of London, for seven years at least, so as such *apprenticeship* do not expire before the *apprentice* shall be twenty-four years of age.

Seet. 27. But no person dwelling in any city or town corporate, being a merchant, mercer, draper, goldsmith, ironmonger, imbroiderer, or clothier, shall take any *apprentice*, except he is his son, or else that the father and mother of such *apprentice* shall have no estate of inheritance or freehold of forty shillings a year, to be certified under the hands and seals of three justices where the lands lie, to the mayor of that city or town corporate, and to be inrolled among the records there.

Seet. 28. Every person being an householder, and twenty-four years old at the least, and not occupying husbandry, nor being a labourer, dwelling in any market-town not not corporate, and exercising any art, mystery, or manual occupation, may have to *apprentice* the child or children of any other artificer, not occupying husbandry, nor being a labourer, inhabiting the same, or any other such market-town in the same shire.

Seet. 29. But no person dwelling in any such market-town, being a merchant, mercer, draper, goldsmith, ironmonger, or clothier, shall take any *apprentice*, except he be his son, or else that his father and mother shall have an estate of inheritance or freehold of three pounds, to be certified under the hands and seals of three justices of the shire where the lands lie, to the head officer of such market-town where such *apprentice* shall be taken, there to be inrolled for a record.

Seet. 30. Any person using the art of a smith, wheelwright, plough-wright, mill-wright, carpenter, rough-mason, plaisterer, sawyer, lime-burner, brick-maker, brick-layer, tyler, slater, helier, tyle-maker, linen-weaver, turner, cooper, miller, earthen-potter, woollen-weaver, weaving household-cloth only, fuller, otherwise called tucker or walker, burner of oar and wood-shives, thatcher, or shingler, wherefoever he shall dwell, may take the son of any person as *apprentice*, albeit his parents have no land.

By the 8 and 9 *Will.* III. cap. 30. reciting, That whereas by an act made in the 43 Elizabeth it is among other things enacted, That it shall be lawful for the churchwardens and overseers of the poor of any parish, or the greater part of them, by the assent of two justices of the peace, whereof one to be of the *quorum*, to bind poor children *apprentices* where they shall see convenient; but there being doubts, whether the persons to whom such children

are to be bound, are compellable to receive such children as apprentices, that such law hath failed of its due execution; therefore it is enacted and declared, "That where any poor children shall be appointed to be bound apprentices pursuant to the said act, the person or persons, to whom they are so appointed to be bound, shall receive and provide for them, according to the indenture signed and confirmed by the two justices of the peace, and also execute the other part of the said indenture; and if he or she shall refuse so to do, oath being thereof made by one of the churchwardens or overseers of the poor, before any two of the justices of the peace for the county, liberty, or riding, he or she shall for every such offence, forfeit the sum of 10 l. to be levied by distress; the same to be applied to the use of the poor of that parish or place where such offence was committed; saving always to the person to whom any poor child shall be appointed to be an apprentice as aforesaid, if he or she shall think themselves aggrieved thereby, his or her appeal to the next general or quarter sessions of the peace for that county or riding, whose order therein shall be final, and conclude all parties."

Though by the statute 8 and 9 IV. III. the master is bound under the penalty of 10 l. to keep an apprentice bound to him pursuant to the statute 43 Eliz. yet if two justices bind a poor girl to a merchant, and he appeals to the sessions, where the order is reversed, it being thought unfit to compel a merchant to take an apprentice; the court of king's-bench, on removing the order before them, may confirm the order of sessions, (as they did in this case); for the statute having given an appeal to the sessions, they are made thereby proper judges, whether the person be a proper person to impose an apprentice on or not. 2 Salk. 491.

The churchwardens and overseers need not aver, that the parents were not able to maintain the child, for they have a discretionary power by the statute, of determining that. Comb. 289.

By the statute 7 Jac. I. cap. 3. sect. 2. it is enacted, that money given to be continually employed to put out poor children apprentices, shall be employed in corporate towns by the corporations, and in other places by the parson or vicar, together with the constables, churchwardens, and overseers of the poor, or the most part of them; who shall have the nomination and placing of such apprentices; and if they shall wilfully forbear or refuse to employ the same accordingly, they shall forfeit five marks each of them so making default, to be divided betwixt the poor of the parish and the prosecutor.

Secl. 3. The party receiving money with such an apprentice, shall give security by obligation, to repay it at the end of seven years next ensuing the date of the said obligation, or within three months next after the end of the said seven years; and if such apprentice shall die within the seven years, then within one year after his death; and if the master, mistress, or dame, happen to die within the seven years, then within one year after their death, so as the money may be employed in placing the apprentice with some other of the same trade, to serve out his time, at the discretion of the parties trusted as aforesaid.

Secl. 4. The money so given shall be employed within three months after the receipt thereof; and if there shall not be apt persons found to be apprentices in the places where it is given, it shall be employed in the parishes next adjoining by the parties that are trusted with it, in the places where it was so given, and there also bond shall be taken, as is before declared.

Secl. 5. The choice of apprentices shall be out of the poorest sort of children, whose parents are least able to relieve them; and no such apprentice shall be above the age of fifteen years when he or she is first bound.

Secl. 6. The parties appointed by this act as aforesaid in any town or parish not corporate, shall yearly, in Easter-week, or within one month after Easter, account before two or more of the next justices of the peace. And if there be any obligations, or money remaining in their hands, they shall upon such account (or within ten days after) deliver the same unto their surveyors.

Secl. 7. If any party so trusted shall break the trust reposed in him, misemploy the same money, or do any thing

contrary to this act, for which there is not by this act any penalty appointed, the lord chancellor or keeper shall, upon the petition of any person, award a commission to such as he shall think fit, to enquire, hear, and determine such offences: and if the commissioners shall find money so misemployed, they shall, in places not corporate, have power to rate and collect it upon the parties so offending, or otherwise upon the able inhabitants of the city, town, or parish so in default, as the said commissioners, or the greatest part of them, shall think fit; and shall return the said commission, together with the manner of executing the same, in the chancery within three months next after such execution thereof.

It was said to be usual in case of apprentices, after they are out of their time, to exhibit a bill to put their masters to sue their covenants within a certain time, or else to deliver up their indentures. Chan. Cases 70. Hill, 17 and 18 Car. II. Baker v. Shelbury.

Apprentice being ill used, brought his bill; decreed that the master deliver up the indentures, and a bond of 100 l. for his honesty, and repay part of the money given with the apprentice, with full costs; the apprentice having before had a verdict in the lord-mayor's court, and the master ordered to provide a new master, which he refused to do. Fin. Rep. 124. Mich. 26 Car. II. Lockley, widow and executrix of Lockley, and David Lockley v. Eldridge.

Bill by a merchant against one that was his apprentice, for an account of goods and money which he was intrusted with, both during his apprenticeship and after, as his factor and agent; the defendant pleaded the statute of limitations 21 Jac. I. the plea was allowed good as to goods, &c. received during his apprenticeship, and till he was made free, but not after his apprenticeship ended; so ordered to answer that part of the bill, but without costs. Fin. Rep. 370. Trin. 30 Car. II. Fincham v. Hobbs.

The master received with the apprentice 250 l. and died within two years, the apprentice having for that time been employed only in inferior affairs; decreed, after debts and specialties paid, that the executors repay the 250 l. as a debt due on simple contract, deducting after the rate of 20 l. per ann. for the maintainance of the apprentice during the time he lived with his master. Fin. Rep. 396. Mich. 30 Car. II. Soam v. Bowden and Eyles.

A placed his son clerk to an attorney, and gave with him 120 l. the master agrees to return 60 l. of the money, if the master died within a year; the master was sick at the time, and of that sickness died within three weeks. Jeffries C decreed 100 guineas to be paid back to A. Vern. Rep. 460. pl. 437. Newton v. Rouse.

Indentures of apprenticeship were decreed in the mayor's court of London, whither the cause was sent back out of chancery, to be delivered up; because not inrolled, though the non-inrolment was at the instance of the mother, which could not excuse the master, who had covenanted to inrol the indentures; and although the apprentice was bound for seven years, yet he covenanted to make him free at the end of five years. 2 Vern. 492. pl. 443. Hill. 1704. Stephenson v. Houlditch.

A puts his son apprentice to B, and gives 1000 l. bond for his fidelity, and at the same time B covenants with A to see the apprentice make up his cash once a month at least. Per Wright K. the meaning is, that B not only see the figures right, but the cash effectually made up, so that B's pretence that the apprentice had inserted bank notes, &c. as remaining, when he had disposed of them, is no excuse, and the bond and covenant are as one agreement, that the plaintiff A would be answerable monthly, provided accounts were taken monthly, and would be liable but for one month's embezzlement, and decreed to A to answer no more than B proved embezzled in the first month, when the embezzlement began. 2 Vern. 518. pl. 468. Montague, executor of Ewer. v. Tidcombe and Hopkins.

An apothecary turned away his apprentice for negligence and misdemeanors laid to his charge; but the court decreed the master to refund 30 l. of the money he had with him, and the rather, because the indentures were not inrolled, so as the matter was not properly cognizable before the chamberlain of London. 2 Vern. 64, pl. 57. Trin 1688. Thorman v. Abell.

A bond of 50l. given by one apprentice to another apprentice for money won at play, decreed to be delivered up. 2 *Vern. Rep.* 291. pl. 281. *Trin.* 1693. *Woodroff v. Farnham.*

Of setting up a trade, the necessity of serving an apprenticeship, and what trades are prohibited to be followed within the meaning of the statute 5 ELIZABETH, and also the offence and punishment of following a trade without being qualified.

At common law, every person might follow what lawful trade he pleased; which being inconvenient in many instances, and a detriment to the public, in permitting persons to exercise trades in which they had little or no skill or experience; to prevent which mischief, and the better to train up and inure persons to labour and industry from their youth, and thereby make them more skilful and expert, the following statute was made. 11 *Co.* 53. 2 *Bulst.* 191. *Skin.* 133. 1 *Sand.* 312.

It is enacted by the 5 *Eliz. cap. 4. sect. 31.* "That it shall not be lawful to any person or persons, other than such as now do lawfully use or exercise any art, mystery, or manual occupation to set up, occupy, use or exercise any craft, mystery, or occupation, now used or occupied within the realm of England or Wales, except he shall have been brought up therein seven years, at the least, as an apprentice, in manner and form aforesaid; nor to set any person to work in such mystery, art, or occupation, being not a workman at this day, except he shall have been apprentice, as is aforesaid; or else having served as an apprentice, as is aforesaid, shall or will become a journeyman, or hired by the year; upon pain that every person wilfully offending, or doing the contrary, shall forfeit and lose for every default forty shillings for every month."

It hath been ruled, that there are many trades within the general words and equity of this act, besides those which are particularly enumerated therein; yet it seems agreed, and hath frequently been adjudged, that in every indictment, &c. it must be alledged, that it was a trade at the time of making the statute; for the words thereof are, any craft, mystery, or occupation, now used, &c. from whence it seems to follow, that a new manufacture, which to all other purposes may be called a trade, is yet not a trade with this statute. 2 *Salk.* 611. *Palm.* 528. 1 *Sid.* 175.

Also it seems agreed, that the act extends only to such trades as imply mystery and craft, and require skill and experience; that therefore merchants, husbandmen, gardeners, &c. are not within the statute; and on this foundation it hath been held, that a hemp-dresser is not within the statute, as not requiring much learning or skill, and being what every husbandman doth use for his necessary occasions. 8 *Co.* 130. 2 *Bulst.* 190. *Cro. Car.* 499.

It is said in 2 *Bulst.* 186. to have been adjudged, that an upholster is not a trade within the statute, as not requiring skill; but this hath been contradicted by a later resolution, [2 *Lev.* 243.] wherein it is said to have been resolved, that a broker and taylor were trades within the statute.

Also it is said in 2 *Bulst.* 190. that a pippin-monger is not within the statute, because there is no mystery in buying of apples, and all his skill is in so laying his apples as to keep them from rotting; but this likewise hath been doubted in a late case, [2 *Lev.* 206.] where it was debated, whether the using of the trade of a colter-monger or fruiterer be within the statute; but there is no resolution.

It is clearly agreed, that the following the common trade of a brewer, baker, or cook, is within the statute, as unskilfulness herein may be very prejudicial to the lives and healths of his majesty's subjects; but it is at the same time agreed, that the exercising of any of these trades in a man's own house or family, or in a private person's house, is not within the restraint of the statute. 11 *Co.* 54. a. *Cro. Car.* 499. *Hob.* 183, 211. *Moor* 886. 8 *Co.* 129. *Palm.* 542. *Lit. Rep.* 251. *Bridg.* 141.

On motion to quash an indictment for using the trade of a sellmonger, it was urged, that this was a business

which required no skill, but that it was only to pull the wool from the skin; but *per Holt, Ch. Justice*; if in the indictment it be averred to be a trade at the time of making the statute, we will not quash it; for whether it was a trade then or no, or whether any skill be requisite to the exercise of it, is a matter of fact proper for the trial of a jury. 2 *Salk.* 611.

So the court refused to quash an indictment for using the trade of a seamstress, not having served as apprentice; because it was set forth in the indictment to be a trade in England at the time of making the act; so that if this trade of a seamstress be not within the act, defendant will have the advantage of it on the trial. 2 *Salk.* 611.

But it is said, that the court had quashed an indictment for following the trade of a merchant-taylor, because they did not know what was meant by it, and it seemed to them nonsense and unintelligible. 2 *Salk.* 611.

It seems agreed, that the following a trade within the statute, must be such whereby the party gets his livelihood; and that therefore, the using of the trade of a brewer, baker, cook, taylor, &c. in one's own house, or in the private family of another, without any reward, is not within the statute. 11 *Co.* 54. *Hob.* 183.

But in an action for using the trade of a clothier, not having been apprentice to that trade; where by special verdict it was found, that A was a Turkey merchant, and exported great quantities of English cloth into the Levant; and for this purpose only he hired several cloth-workers, who had been all apprentices to the same trade, and kept also a master workman of that trade to inspect their work; and that by those men he made great quantities of English cloth, all which he transported; and that he the said A kept a dye-house, and hired men of that trade to dye his own cloths, and no other: it was resolved to be within the restraint of the statute, though the cloth was made for his own merchandize only, and though made by persons who had been apprentices; for here they are not traders but hirelings, and he is the tradesman who hath all the profit, as A in this case has. *Carth.* 162. 2 *Salk.* 610. 3 *Mod.* 313.

So if a man keeps journeymen shoe-makers to make shoes for transportation, this is an exercising the trade of a shoemaker within the statute. *Carth.* 164.

But it hath been held, that this statute doth not restrain a man from using several trades, so as he had been an apprentice to all; whereof it indemnifies all petty chapmen in little towns and villages, because their masters kept the same mixed trades there before. *Carth.* 163.

If a coach-maker keeps servants to make his wheels, and workmen to curry his own leather, this is against the statute, because it is he only who receives all the profits of the several trades, and the wheelwright and currier are but his servants. *Carth.* 163, 164.

So in a case upon this statute, prosecuted by the horner's company against a comb-maker in London, for using the trade of a horner, viz. in pressing horn for making combs, which pressing did not belong to their trade; and this was adjudged a breach of the statute, for a horner is a particular trade, and a very ancient company in London. *Carth.* 162.

It hath been resolved, that there is no occasion for any actual binding, but that the following a trade for seven years is a sufficient qualification within the statute. 1 *Salk.* 67. 2 *Salk.* 613.

So where an action was brought on this statute, and upon not guilty pleaded, it appeared that the defendant's father kept the same trade, and that he the defendant for several years had been employed by his father therein; and it was held, that he might lawfully use that trade, for that he had been quasi an apprentice to it, which was sufficient to satisfy the statute. *Carth.* 163.

So if a man lives with another, that uses a trade which the other is not qualified for using, seven years, he may set up the trade as well as if he had lived with one never so well qualified. *Case in Low and Eq.* 71.

Also it hath been held, that the service need not be in any particular country; and therefore an indictment for using the trade of a taylor, not having served an apprenticeship seven years, was quashed, because only said, not having

having served as an *apprenticeship infra regnum Angliæ aut Walliæ*; for it may be he did so beyond-sea; and if it were any where it suffices. 1 *Salk.* 67.

So it hath been held, that serving five years to a trade out of England, and two in England, is sufficient to satisfy the statute; but that there must be a service of a full time, either in England or out of England; and therefore serving five years in any country, where by the law of the country more is not required, will not qualify a man to use the trade in England. *Case in Law and Equity*, 70.

By the statute 31 *Eliz.* cap. 5. sect. 7. it is enacted, "That all suits for using a trade without having been brought up in it, shall be sued and prosecuted in the general quarter-sessions of the peace, or assizes in the same county where the offence shall be committed, or otherwise inquired of, heard and determined in the assizes, or general quarter-sessions of the peace in the same county where such offence shall be committed, or in the leet within which it shall happen, and not in any wise out of the same county where such offence shall happen or be committed."

In the construction of this statute it hath been held, that it restrains not a suit in the King's Bench or Exchequer, for such offence happening in the same county where the courts are sitting; for the negative words of the statute are not, that such suits shall not be brought in any other court, but that they shall not be brought in any other county; and the prerogative of these high courts shall not be restrained without express words. *Cro. Jac.* 178. *Hob.* 184. 1 *Salk.* 373.

But where the offence is in a different county, such suits in these, or any other courts out of the proper county, seem to be within the express words of the statute. *Hob.* 184, 527. *Cro. Jac.* 85.

Yet it hath been doubted, whether an action of debt, or information in the courts of Westminster-hall, were not to be construed to be out of the meaning of the statute; but it seems to be now settled, in the construction of the statute 21 *Jac.* I. cap. 4. which provides, that no action of debt or information, or other suit whatever, can be brought in any court of Westminster-hall on any penal statute, made before the said statute of 21 *Jac.* I. for any offence therein excepted, for which the offender may be prosecuted in the county, unless such offence shall be committed in the same county in which the court shall sit. *Sid.* 303. 1 *Keb.* 584. 2 *Lev.* 204. 1 *Salk.* 372. 5 *Mod.* 425.

But these statutes hinder not the removal of any indictment into the King's-Bench by *certiorari*, after which it may be tried there, or in the county, by *nisi prius*. 1 *Jac.* 193.

It hath been held, that quarter-sessions of boroughs may receive indictments on the 5 *Eliz.* as well as those of the county at large, in that there is no danger of oppression, because a *certiorari* lies. 6 *Mod.* 220. 1 *Salk.* 317.

The plaintiff, in an action on this statute 5 *Eliz.* must alledge in his declaration, that the defendant did not use the trade at the time of making the statute; for though it cannot be presumed that he did, after such a length of time, yet as it is, the statute makes him liable, and subjects him to a penalty; the prosecutor must shew that he has transgressed the law, and that he is intitled to his action. 1 *Sid.* 302.

It has been held, that an indictment against two or more, for following a joint-trade, without having served a seven years *apprenticeship* required by the statute, is naught, in that it would be absurd to charge them jointly: because the offence of each defendant arises from the defect peculiar to himself. 1 *Roll. Abr.* 8. 5 *Mod.* 180. 1 *Salk.* 382.

Of assigning apprentices, making them free, and how to be taken care of if their masters happen to die.

The placing out an *apprentice* to a particular person, arises from an esteem, and a good opinion of the party to whom he is so committed; that he will not only instruct him in his trade or calling, but will also be careful of his health and safety; and therefore the law has made it such a personal trust or confidence, which the master

cannot assign, or transfer over to another, he must also have him under his own care and inspection, and cannot send him abroad, though under the pretence of improvement; unless by express agreement, and unless the nature of his business requires it, and implies such a power as that of a merchant-adventurer, sailor, &c. are said to do; therefore it hath been adjudged, that a surgeon sending his *apprentice* a voyage to the East-Indies, though in company with other surgeons, and the better to instruct him in the art of surgery, was a breach of his covenant, whereby he bound himself to retain, teach, keep, and employ the said *apprentice* in his own house and service, &c. *Hob.* 134.

But by the custom of London, a freeman of London may turn over his *apprentice* to another master, being a freeman; and such second master shall have the same benefit of the *apprentice's* covenants, as shall the *apprentice* of the covenants on the side of the master, as if he had been originally bound to him. *March.* 3. 1 *Keb.* 250.

But it hath been held, that though justices of peace have a jurisdiction of discharging *apprentices*, and may bind them to other masters, that they cannot turn them over; and therefore an order that an *apprentice*, whose master was dead, should serve the remainder of his time with his master's widow's second husband, was quashed; because the justices have nothing to do about turning over an *apprentice*; and that though he applied to them, that could not give them a jurisdiction. *Comb.* 324.

Order returned on a *certiorari*: it is resolved by the justices at the sessions, where a person was bound an *apprentice* to *Barnes* by the parish officers, and *Barnes* had assigned him to another, that the assignment is void, and they directed *Barnes* to take his *apprentice* again. But by the court; the sessions had no power to judge of the validity of a deed, or to hinder a man from assigning his *apprentice*; the covenant to provide for him is well performed, if the person to whom he is bound assigns him to another to provide for him; wherefore the order was quashed. *Foley* 155. *Strange* 48.

The jurisdiction of the justices extends no farther than to compel the master to take care of his *apprentice*; but in what manner he does it, whether in his own house or otherwise, is nothing to them; but if the assignee of the *apprentice* doth not provide for him, the first master may be compelled to do it, and he may take his remedy over. *Seff. Ca.* vol. i. 110.

Wherever by the custom of any town, borough, &c. the serving an *apprenticeship* intitles the party to his freedom, the persons to admit him refusing, without sufficient cause, may be compelled thereto by *mandamus*. 1 *Sid.* 107. 2 *Shov.* 154.

Therefore, where to a *mandamus* to the mayor, &c. of Oxford, to admit a person to be free of that city, who had served seven years *apprenticeship*; to which it was returned, that he put himself *apprentice* seven years according to the custom, and that he covenanted to serve seven years, and not to marry within the time, and that within the first two years he married, and so broke his covenant; and that his master accepted of him to serve for the residue of the time, which he did, but not as an *apprentice*, but rather as a journeyman; and though it was urged, that by his breach of covenant he lost his right of freedom, yet the court held the contrary; and that though an action of covenant might lie, yet that it was no loss of his freedom; and therefore awarded a peremptory *mandamus* to admit him. 1 *Lev.* 91. 1 *Sid.* 107. 1 *Keb.* 458, 470, 659.

So where a *mandamus* to the mayor, &c. of Lincoln, to admit A to his freedom, he having served an *apprenticeship* there; and the mayor returned, that A (being a quaker) refused to take the usual oath, according to the custom of the said city, but offered to take the solemn affirmation and declaration; and the court held this sufficient to intitle him to his freedom, within the statute 7 and 8 *W. III.* cap. 34. 5 *Mod.* 402.

Also it is frequent for masters to bind themselves to make their *apprentices* free at the end of their time, which they perform according to their covenants. 6 *Mod.* 227, 260.

It seems agreed, that if a man be bound to instruct an apprentice in a trade for seven years, and the master dies, that the condition is dispensed with, being a thing personal; but if he be bound further, that in the mean time he will find him in meat, drink, and clothing, and other necessaries, here the death of the master doth not dispense with the condition, but his executors shall be bound to perform it as far as they have assets. *1 Sid. 216. 1 Keb. 761, 820. 1 Lev. 177.*

But if a person is bound apprentice by a justice of peace, and the master happens to die before the term expired, the justices have no power to oblige his executor, by their order, to receive such apprentice and maintain him; for by this method the executor is deprived of the liberty of pleading *plene administravit*, which he may do, in case covenant be brought against him, and must maintain the apprentice, whether he hath assets or not. *Carth. 231, 1 Salk. 66. 1 Show. 405.*

But it is said, that in this case of the master's dying, by the custom of London, the executor must put the apprentice to another master of the same trade. *1 Salk. 66. Per Holt. Ch. J.*

In debt on bond, conditioned for *Matthias Anderson's* performance of the covenants in an indenture of apprenticeship, whereby he was bound to the plaintiff's testator, who was a mariner: the defendant pleaded, that Anderson served faithfully to the death of the testator: the plaintiff replied, that since the death of the testator, Anderson, had absented from her service: to which there was a demurrer. And after argument at bar, *Lee Ch. J.* delivered the resolution of the court, viz. that they were all of opinion, the defendant should have judgement, and that the executrix could maintain no such action; the binding was to the man, to learn his art, and serve him, without any mention of executrix. And as the words are confined, so is the nature of the contract; for it is fiduciary, and the apprentice is bound from a personal knowledge of the integrity and ability of the master. *H. 8 Ann. Horne and Blake.* An award that an apprentice should be assigned, was held void; unless there was a custom, or the concurrence of the apprentice. And they held it was not material, that according to *Cro. Eliz. 553.* the assets were liable on the master's covenant to maintain. Therefore judgment was given for the defendant. *Strange 1266.*

Note, the words in *Cro. Eliz. 553.* are these: A covenant lies against an executor in every case, although he be not named; unless it be such a covenant as is to be performed by the person of the testator, which they cannot perform.

But in the case of *K and East-Bridgford*, in *Trin. 12 George II.* upon a special order it was stated, that an apprentice upon the death of his master, was with his own consent turned over by the widow (who had taken no administration) to another master whom he served. And the court held it a good settlement in the parish, within the reason of those cases, where an apprentice was bound to a person in one parish, but with the consent of his master served with another person in another parish, and there gained a settlement. *Strange 1155.*

Of offences committed by apprentices.

At common law, a servant or apprentice, without any regard to age, may be guilty of felony feloniously taking away the goods of their master, though they were under their charge, as a shepherd, butler, &c. and may this day for any such offence be indicted, as for felony at common law; but at common law, if a man had delivered goods to his servant to keep, or carry for him, and he carried them away *animo furandi*; this was considered only a breach of trust, but not felony. *1 Hale's Hist. P. C. 505, 666.*

But now by the statute of *21 Hen. VIII. cap. 7.* it is enacted, "That all and singular servants, to whom any caskets, jewels, money, goods, or chattles, by his or their masters or mistresses shall from henceforth be delivered to keep, that if any such servant or servants withdraw themselves from their masters and mistresses, and go away with caskets, jewels, money, goods, or chattles, or any part thereof, to the intent to steal the same, and

defraud his or their masters or mistresses thereof, contrary to the trust and confidence to him or them put by his or their masters or mistresses, or else being in the service of his or their masters or mistresses, without any assent or commandment of his master or mistress, imbezzle the same caskets, jewels, money, goods, or chattles, or any part thereof, or otherwise convert the same to his or their own use, with like purpose to steal it; that if the said casket, jewel, money, goods or chattles, that any such servant shall go away with, or which he shall imbezzle, with purpose to steal as aforesaid, be of the value 40 l. or above, that then the same false, fraudulent, or untrue act and demeanor shall from henceforth be deemed and adjudged felony, &c. provided it extend not to apprentices, nor to any person under the age of eighteen years; but every such apprentice, or person within that age doing that act, shall be, and stand in the like case, as they were before the making this act.

By the act of *27 H. VIII. cap. 17.* clergy was taken away in this case, if the indictment were laid specially upon the act of *21 H. VIII.* and pursuant to the same, and by the act *28 H. VIII. cap. 2.* this act of *21 H. VIII.* was made perpetual; but by the act of *1 Edw. 6. cap. 12.* these acts were both repealed; but again, by the act of *5 Eliz. cap. 10.* this act of *27 H. VIII.* was re-enacted and revived; but it did not revive the act of *27 H. VIII.* for taking away clergy. But now by *12 Ann. cap. 7.* clergy in such case is taken from facts committed in any house or out-house, except as to apprentices under the age of fifteen years robbing their masters. *1 Hale's P. C. 666, 667.*

In the construction of this statute the following opinions have been holden.

1. That it extends only to such as were servants to the owner of the goods, both at the time they were delivered, and also at the time when they were stolen. *1 Hawk. P. C. 92.*

2. That it is strictly confined to such goods as are delivered to keep; and therefore that a receiver, who having received his master's rents, runs away with them, or a servant who being intrusted to sell goods, or to receive money due on a bond, sells the goods, &c. and departs with the money, is not within the statute; but that a servant who receives his master's goods from another servant, to keep for his master, is as much guilty as if he had received them from the master's own hands; because such a delivery is looked upon as a delivery by the master. *Dyer 5 pl. 2, 3. 3 Inst. 105. 1 Hawk. P. C. 92.*

3. That it includes not the waiving or consuming of goods, howsoever wilful it may be; nor the taking away of an obligation, or another bare chose in action. *1 Hawk. P. C. 92.*

4. That it extends not to the taking of such things, whereof the actual property is not in the master at the time; and therefore, that if a servant having money or corn, &c. delivered to him, melt down the money of his own head, without the command of his master, into a piece of plate, or turn the corn into malt, and then run away with them, that he is not within the statute; because the property of these things is so far changed, by altering them in such a manner, that they cannot be known again, and the master cannot afterwards take them, without being a trespasser; but it is agreed, that if a servant make a suit of coats of cloth, or a pair of shoes of leather, delivered to him by the master, and then he run away with them, that he is within the statute; because the property is no way altered; and even in the first case *Hawkins* seems to be of opinion, that the taking of the plate and malt is within the statute; and the whole act of the servant, taken together, should be deemed a conversion of the master's goods to his own use, with an intent to steal them, which brings it within the express letter of the statute; and on which foundation it hath been resolved, that a servant who changes his master's money from silver to gold, and then runs away with it, is within the statute. *Crompt. 50. Dalt. c. 102. 1 Hawk. P. C. 92.*

Settlement of apprentices.

By *stat. 13 and 14 Car. II. c. 12.* On the complaint by the church-wardens or overseers within forty days after

after any person shall come to settle in any parish, on any tenement under 10l. a year; two justices, (one of whom to be of the *quorum*) may remove him to the place where he was last legally settled, either as a native, householder, sojourner, apprentice, or servant, for the space of forty days at the least.

By the *stat. 1 Jac. II. c. 17.* the said forty days shall be reckoned not from the time of his coming to inhabit, but from the time of his delivering notice in writing of the house of his abode, and the number of his family, to one of the churchwardens or overseers of the poor of the parish to which they shall remove.

And by the *statute of 3 and 4 W. and M. c. 11. sect. 8.* if any person shall be bound an apprentice by indenture, and inhabit in any town, or parish, such binding and inhabitation shall be adjudged a good settlement, though no such notice in writing be delivered and published.

By statute 12 Ann. *st. 1. c. 18. sect. 2.* if any person shall be an apprentice bound by indenture, to any person residing under a certificate, in any parish, township, or place, and not afterwards having gained a legal settlement in such parish, township or, place; such apprentice, by virtue of such apprenticeship, indenture, or binding, shall not gain any settlement in such parish, township, or place; but every such apprentice shall have his settlement in such parish, township, or place, as if he had not been bound apprentice.

A puts B apprentice to C, but B is no party to the deed; B continued a year with C; adjudged, that this makes no settlement in the parish C is of; because it was no service, and B was no more than a boarder there for his education, which is no service to make a settlement. 2 Salk. 479.

Misselden sent *J. H.* his wife and children to *Panfwick*, and the sessions on the appeal discharged the order; then the same persons were sent by another order to *Brimsfield*, as the place of their birth; *Brimsfield* appealed, and the session's order recited the whole matter of fact; which was, that *J. H.* was an apprentice by deed, to one *J. S.* a butcher, and there was a parol agreement to live one fortnight at his father's house, and another fortnight at his master's. The order took notice, that he did not live forty days at one time in one place; but concluded, that he was settled at *Panfwick*, different to the former session's order. It was moved to quash the session's order, it being on an erroneous notion, and the conclusion will not warrant the premises; for the statute says there must be an inhabitation as well as an apprenticeship for forty days at least; the court was of opinion to quash the session's order, and a rule was made to shew cause to the first day of the next term. *Ca. of settlements* 63. pl. 85.

A poor child being bound apprentice at A, was assigned over to another master that lived in B; held he should gain a settlement at B, where his second master lived. 1 Salk. 68. pl. 7. *Mich. 13 W. III. B. R. Castr. v. Aicles parish.*

The son was bound an apprentice to his father, and the father gave up his indenture to the son, and bound him out to a service into another parish for a year, where he served, but did not cancel the indenture, and becoming poor, the justices ordered him last legally settled in the parish where the father lived, because the indenture being still in force, his apprenticeship continued; *per cur.* The indenture not being cancelled, the obligation of the apprentice continues; and if the father should get the indenture into hands again uncanceled, and sue the son thereupon, the aforesaid agreement would not be a good plea for the son. 6 Mod. 190, 191.

Apprentice may gain a settlement by serving a lodger, though the master has no settlement there. 2 Salk. 553. pl. 21. *Hill. 4 Ann. B. R. parish of St. Bride's, v. St. Saviour's.*

B was bound apprentice for four years to *J. S.* and lived out these four years at *St. Bride's* with him; *J. S.* was only a lodger, and had no settlement there, and the court held the apprentice was well settled at *St. Bride's*; for he was not a person removable, nor does his settlement depend on his master, as that of a wife on her husband for a settlement, but he gains a settlement for himself within 14 Car. II. by forty days inhabitation; and so of a hired servant. 2 Salk. 533.

Where a person is bound apprentice by indenture, wherever this apprentice continues forty days in the service of his master or mistress, there such apprentice gains a settlement; and where any person serves the last forty days of his apprenticeship, that is the place of his last legal settlement; and so it is likewise of an hired servant. *Ca. of settlement.* 58.

A removed his certificate from B to C, takes an apprentice, who serves out his time at C, and lives two years, cannot be removed with his master. 11 Mod. 204.

A gardener took an apprentice, but having no work for him, made an agreement with a man who lived in another parish, that his apprentice should work with him for wages, which he accordingly did, and the master had the wages. *Powis J.* was of opinion at *Dorchester affizes, Lent 1709*, that this apprentice did not gain a settlement by this service in the parish where he worked; this matter coming in question before him upon a case stated. 3 Vin. 29. cites *M. S. Cases.*

A was bound apprentice to one D, who was an inhabitant and settled in *All-Saints*, and there dwelt with him above a year; the man removed to W, and there lived five years, but gained no settlement. The question was upon a special order, whether the apprentice was to be settled where he was bound, and lived the first year with his master, or where he lived the last five years with his master; and *per cur.* whether the master has a settlement or not, the apprentice gains a settlement by his service. 3 Vin. 29. *M. S. Cases. Trin. 9 Ann. B. R.*

If an apprentice be bound to one who has no right to take an apprentice, yet the apprentice will gain a settlement under such an indenture by his service. 3 Vin. 129. *MS. Cases, Trin. 9 Ann. B. R.*

A person was bound apprentice to a cobbler, who lived in one parish, and his stall was in another; the apprentice lived with his father in a third parish; and it was held *per cur.* that he gained no settlement as an apprentice. *Cases of settlements* 80. pl. 106. *Pasch. 1717. the parish of St. Olave Jury's Case.*

One G was an apprentice to *J. S.* a seafaring man, who lived in the parish of *St. Olave Jury*; the apprentice lived with his master three months, but always on ship-board out of the Parish. *Prat J.* said it does not appear that he was sent by his master to watch on ship-board; if it had, it had been on his master's business, and continuing in his service, and doing his duty. The court adjudged he was not settled in the parish; for there must not only be an apprenticeship, but a residency. And a man is deemed to be resident where he lodges. *Cases of settlements* 79. pl. 105.

One born in A is put apprentice in B, where he served two years, and then his master died, when he went back to A, and married, had children, and died; the wife and children shall be sent back to B. 8 Mod. 169. 9 Geo. I. *St. Giles in Reading, v. Everfly Blackwater.*

Where one is bound apprentice by indenture, it cannot be discharged but by deed, or by sessions, and a hiring after he is bound, or any consequences arising upon such hiring, are entirely void while the indenture subsists, and 'till it is defeasanced; for when an apprentice serves forty days, by virtue of the indenture, he cannot gain another settlement, though his master consents, because he had a settlement by the service under the indenture. Admitted *per cur.* 8 Mod. 236. *Pasch. 10 Geo. Buckingham parish, v. Sevington.*

One *J. W.* was bound apprentice to *J. P.* of *St. John's parish*, in the *Devizes*, hofier, the father was to find meat, drink, washing, and lodging, the master allowing 2s. 6d. per week; the apprentice never lodged with his master in *St. John's parish*, but with his father in *Bishop Canning's*. Held that the apprentice gained no settlement in *St. John's parish*, by virtue of the apprenticeship with his master, in regard he never lodged in the parish for the space of forty days. *Cases of settlements* 118. pl. 159. *Trin. 1724. B. R. the chapelry of St. James, in the parish of Bishops Cannings, v. inhabitants of Devizes, in the county of Wilts.*

A, bound apprentice to a butcher in *Cirencester*, lived with his father for the first six years, and then came and lived with his master up and down for three quarters of a year. It was objected, that it did not appear that he lived forty days with his master; *per cur.* It is set forth that he

was up and down three quarters of a year with his master; so there is room to intend he was resident forty days. *Cases of settlements*, 118. pl. 152. *Trin.* 1724. *B. R.* In case of the chapelry of *St. James*, in the parish of *Bishop Canning's*, v. *Inhabitants of St. John's*, in the *Devizes*, in the county of *Wilt*, cites the king, v. *Cirencester* (inhabitants).

A was bound apprentice to B, who lived in *St. Olave's*, afterwards A, by his master's consent, lived with another person in *Allhallows*. And *per cur.* He gained a settlement in the last place; for a person may serve his master in another place or parish; and although he serves another man, yet it is by consent of his master, and the benefit accrues to the master. *Cases of settlement* 114. pl. 153. The parish of *St. Olaves, Southwark*, v. *Allhallows*.

A person was bound apprentice to a gentleman, who made use of him as his huntsman, and lived with him three quarters of a year, and then ran away; *per cur.* Here is a serving for forty days, and so the person gains a settlement. It was objected, that he served a gentleman, and consequently of no trade; but *per cur.* He is put an apprentice, and the master may make use of him in what manner he pleases, and therefore held a settlement accordingly. *Cases of settlements* 122. pl. 166. *Trin.* 1726. The king, v. The inhabitants of *Whitechurch*.

J. S. agreed to be put out apprentice to J. N. and was bound for seven years, and 20 s. was paid J. S.'s master; after J. S. had served three years, his master died. The indentures were not stamped, nor the duty paid; on an order of sessions that it was a settlement, and a reference to the judges of assize, *Fortescue* J. was of the same opinion, but it was moved to quash it, because 3 and 4 *W. and M.* says apprentices bound by indenture shall be intitled to a settlement, and this indenture being not stamped, is no indenture by 8 *Anne*, and so held the court. 4 *Geo.* II. *B. R.* *Fitzgib* 167. *Anon.*

Upon the appeal of *St. George's* against an order of two justices, whereby *Alice Wheeler*, a single woman, who was likely to become chargeable to *St. James's, Westminster*, was removed from thence to *St. George's*, as the place of her last legal settlement; and the sessions state the matter specially, and the said *A. W.* was bound by indenture a parish apprentice in the said parish of *St. George*, to *George Lester*, where she lived and gained a settlement, by serving the space of forty days under the said indenture; and that afterwards, and during the time of her apprenticeship, she was by parol agreement hired out by the said master *G. L.* to one *J. Hall*, in the parish of *St. Mary-le-bone*, and there lived and lodged above forty days, viz. for the space of one year and upwards, the said apprenticeship continuing; that the said *G. L.* her master, received her wages from the said *J. H.* and found clothes; and on debate, the question was, whether the said *A. W.* by her residence above forty days in *St. Mary-le-bone*, gained a settlement in that parish or not? The sessions held, that the last service gained her no settlement, and consequently she was settled at *St. George's*. But the court quashed the order, being of opinion, that there was no difference between the master hiring her out, and her own act; and that it was like the case of a hindling to A, and serving B, where it has been always held to be a settlement in B's parish. So the order of sessions was quashed. *Seff. Ca.* vol. 2. case 138. 2 *Strange* 1001. *Mich.* 8 *Geo.* II.

Upon a special order of sessions the case was stated, that an apprentice was bound to A in one parish, but by agreement served B in another parish, and the sessions settled him with B, and by the court; he gains a settlement in the last place; for a person may serve his master in another parish, or place; and although he serves another man, yet it is by consent of his master, and the benefit accrues to his master. *Strang.* 554. *Cases of S.* 153. *Trin.* 9 *Geo.* I. Between the parishes of *Allhallows on the Wall*, and *St. Olave in Surry*.

Parker, Cb. J. delivered the resolution of the court. This is an order for the removal of one *Ferrer*, from the parish of *Holy Trinity*, to *Shoreditch*; by which it appears that *Ferrer* was bound an apprentice to one *Truby*, with an intent that he should serve *Green*; which he did for three years. And it has been insisted, that he being bound to *Truby*, who lives in *Trinity parish*, his settle-

ment is there, and not in *Shoreditch*, where his service was; but we are of opinion the justices have done right in sending him to *Shoreditch*, where the service actually was. It is the same thing as if *Truby* had turned him over to *Green*, in which case there would have been no question but he had gained a settlement in *Green's* parish. If the master removes out of one parish into another, the apprentice gains a settlement if he lives there forty days; the turning over an apprentice is like the signing any deed; in this case *Truby* was only a trustee. There is a great deal of difference between apprentices and other servants; for apprentices are not presumed to become chargeable, because the trade and mystery they learn is their estate; therefore the order must be confirmed. *Strange* 10. *Mich.* 3 *Geo.* I. *Parishes of Holy Trinity and Shoreditch*.

Upon a special order the case was stated, that A was bound an apprentice, and served and inhabited two years, till a commission of bankruptcy was taken out against the master; at which time the apprentice, without having the indenture delivered up, or any discharge at the sessions, hires himself as a common servant into another parish, and served a year. The sessions adjudge this to be no dissolution of the apprenticeship, and consequently, that the settlement of the apprentice was in the first parish where he was bound. And by the court their judgment is right. There could be no dissolution of the contract, unless the indenture had been delivered up, or the sessions had discharged him; as no doubt they would have done, if they had been applied to: and then, as as the first contract had continuance, the apprentice had no power to hire himself; and the service afterwards for a year was void, as to any pretence of giving him a settlement. That service must be taken as a service to the master, who by law was intitled to the wages, and therefore the order must be confirmed. *Strange* 582. *East.* 10 *Geo.* I.

It was stated, that an apprentice was bound in the parish of A, and lived there, off and on, for three quarters of a year. Exception was taken, that it was no settlement, since he might not inhabit forty days together. But by the court, that is not necessary; and the order for making it a settlement was confirmed. *Strange* 579. *Hill.* 10 *Geo.* I. The king against the inhabitants of *Cirencester*.

Upon a special order of settlement it was stated, that a poor boy was bound out apprentice by indenture, and the master had 20 s. paid him; and he served three years; but the master never paid the duty of 6 d. in the pound, according to 8 *Ann. c. 9. sect.* 39. which says, that if the duty be not paid, the indenture shall be void to all intents and purposes whatsoever. The case was referred to *Fortescue justice*, who went the circuit; and he held it a settlement, because the master had six months to pay the duty in, so that during those six months a settlement was gained; and it should not be in the power of the master to defeat it by matter *ex post facto*; and pursuant to this opinion, the sessions held it a settlement. But upon a debate in *B. R.* the order was quashed; for they said, it was making the indenture good to one purpose, when the act of parliament had made it void to all intents and purposes whatsoever; and though it was a hard case, he could not break through the positive words of the act. *Strange* 903. *East.* 3 *Geo.* II. Between the parishes of *Curenden*, and *Layland*, in *Lancashire*.

Upon a special order of sessions, it was stated, that *James Blyth*, in 1706, was put apprentice to *St. Peter's* for four years by indenture, and that he lived there, and served the time; but inasmuch as he was not bound for seven years, as 5 *Eliz. c. 4.* requires, the sessions adjudged it no settlement; and the forty-first session of the statute was insisted on to support the order, which declares, "That all indentures, covenants, and bargains, of or for the having or taking any apprentice, otherwise to be made or taken, than is by that statute ordained, shall be clearly void in law, to all intents and purposes." And one of the former regulations is, that the binding shall be for seven years. And the case of *Curenden* and *Layland* [the preceding case] was relied on, where the apprenticeship was for seven years; but the indentures never stamped, and held to be no settlement.

But

But notwithstanding this, the court was of opinion, there was a settlement, and quashed the order. It appears, that between the twenty-sixth and forty-first sessions, there are many regulations, what sort of persons shall take apprentices, and what not; which are never regarded; and it would be of mischievous consequence now to refer this last session back to all the rest. They said the word void must be construed voidable; as on the *statute West. 2. finis ipso jure fit nullus*, it is yet a discontinuance. *Hob. 166.* and on *23 H. 6. c. 10.* You must plead specially, and cannot avoid a bail-bond on *non est factum*. Here the indenture has had its effect, and neither master nor servant has taken advantage of the objection; and as to the case of *Curenden and Layland*, on the *8th Ann. c. 9.* there were words prohibiting the giving the indenture in evidence; and admitting improper evidence is always a ground to quash. *Stra. 1066. Mich. 10 Geo. II.* Between the parishes of *St. Nicholas* and *St. Peter*, in *Ipswich*.

A is bound apprentice to a seafaring man, and served him for a quarter of a year in the day-time on land, in the parish of *St. Mary Colechurch*, but lay every night on ship-board in *Radcliff*; but the justices apprehending the settlement to be where the service was, sent him thither. *Corbit* moved to quash this order, and likened it to the case of the cobbler above-mentioned. *Chief-justice*: A man properly inhabits where he lies; as in the case where the house is in two leets, he is to be summoned to that in which his bed is; order quashed. *Strange 60. Trin. 1 Geo. I.* Parishes of *St. Mary Colechurch*, and *Radcliff*.

Upon a special order it was stated, that the pauper was bound to a certificate-man in *Tenterden*; and after living with him there two years, was by him assigned over to a parishioner of *Lidd*, with whom he inhabited and served the remainder of the seven years. And the question arose on *12 Ann. Stat. 1. c. 18.* which says, the apprentice of a certificate-man shall gain no settlement, whether the assignment could give him one; and the court were all of opinion, he had gained a settlement in *Lidd*; for the act had not made the binding void, but has only taken away one of the consequences of such binding, for the sake of the certified parish. It never intended to meddle with the case of a legal parishioner's apprentice, and when once there is an assignment to such an one, it is the same as if it had been an original binding; the true construction of the statute is, that in respect to the certificated parish, such binding and inhabitation shall give no settlement. *Sir. 1147. Mich. 14 Geo. II.* The king against the inhabitants of *Pebham*.

Upon a special order of sessions, the case was stated for the opinion of the court; that in 1702, one *Richard Plower* was bound apprentice to *John Emerton*, who was legally settled in *Ivinghoe*; that he served part of his time there, and then the master went with all his family as a certificate-man to *Stone-bridge*, where he purchased an estate of the value of 60*l.* and after such purchase the apprentice lived with him six months, 'till the apprenticeship expired; and because the *statute 12 Ann. c. 18.* provides that the apprentice of a certificate-man shall gain no settlement in the parish to which the master goes by certificate; therefore the judges adjudge the settlement at *Ivinghoe*, where the binding, and great part of the service was. And by the court, the order must be quashed: for as the apprenticeship expired in 1709, the *statute 12 Ann.* is out of the case, not being made with any retrospect; and then the case is no more, than that an apprentice of a certificate man lives forty days in *Stone-bridge*, which before that statute was enough to gain him a settlement; but if this had been a case since the statute, yet we think the settlement would lie in *Stone-bridge*; for according to the case of *Burdear and East-woodhay. East. 5 Geo. I.* in *B. R.* when a certificate-man makes a purchase, he immediately ceases to be there in nature of a certificate-man, and becomes a settled inhabitant; so that laying the statute out of the case, (as we must do, it being nothing to the purpose) in view here is a service for six months as an apprentice, in a parish where the master was legally settled, which is now more than sufficient to give a settlement to the apprentice. *Stra. 265. Hill. 6 Geo. I.* Between the parishes of *Ivinghoe* and *Stone-bridge*.

Statute 31 Geo. II. c. 11. sect. 11. Whereas by an act made in third year of the reign of king *William* and queen *Mary*, intitled, An act for the better explanation and supplying the defects of the former laws for the settlement of the poor, it is enacted, That if any person shall be bound an apprentice by indenture, and inhabit in any town or parish, such binding and inhabitation shall be adjudged a good settlement; and whereas since the making the said act, great numbers of persons having been unwarily bound apprentice, by certain deeds, writings, or contracts, not indented, by which binding many of them have suffered great loss and damage, on account of their having been refused a settlement in such town or parish, where they have been so bound and resided forty days, and have been removed to the parish or place where their last legal settlement was before such apprenticeship, where they had no encouragement to exercise their trades, or opportunity to gain a livelihood by their said trades to which they were so bound apprentices; for the relief therefore of such apprentices, and for preventing the like mischief for the future; Be it enacted, &c. That no person who shall have been an apprentice, or who shall hereafter be bound an apprentice by any deed, writing, or contract, not indented, being first legally stamped, shall be liable to be removed from the town, parish, or place, where he or she shall have been so bound an apprentice, and resided forty days, by virtue of any order of removal, granted by two justices of the peace of any county, riding, division, city, town-corporate, or place; or by virtue of any order of the justices, at their general or quarter sessions, by reason, or on account of such deed, writing, or contract not being indented only.

Pleadings in action brought by and against masters and apprentices.

Action on the case by A against B, for enticing his apprentice (A being a tradesman in London) to depart from his service for six days, and divers times to take money out of the box of the shop, and play at cards with B, and that B cozened the apprentice: the court thought A might well have an action for the departure, and losing the money is a damage to A, and the cozenage is but an aggravation of the offence, and for that the apprentice himself only shall have an action; but in this case, because the damages were entire with respect to the cozenage as well as to the departure, A could not have judgment by the better opinion of the court. *Noy. 105.*

Indictment for causing an apprentice to absent himself from his master, and keeping and detaining him in that absence. It was moved to quash it, because not a thing of a public nature, being no other than an action on the case; but the court said, it was a great offence, and would not quash it; but left the party to demur, if he would. *12 Mod. 195.*

An indictment was for procuring an apprentice to depart unlawfully from his master, and seducing him to take and carry away his master's goods. The defendant was found guilty; and it was moved, that this was only a private injury, for which case lies, and not in its nature public to maintain an indictment; besides, no fact is laid to be done in pursuance of the enticing; and as to the carrying away the goods, no venue is laid where the goods were taken away; and judgment was arrested. *1 Salt. 380.*

A common action of trespass will not lie for enticing an apprentice or servant from his master; but if one will take away my apprentice or servant with force, trespass will lie for the master, declaring upon the force, *per quod servitium amisit*; *per tot. cur. 6 Mod. 182.*

If a man knows that an apprentice ran away from his master, and he keeps and employs him, the proper remedy is to bring an action for so much money paid to the plaintiff's apprentice in wrong of the plaintiff; *per the Ch. J. Barnard. Rep. in B. R. Pasch. 2 Geo. II.* at the fittings at *Guildhall. Aynsworth, v. Wood.*

One of the age of sixteen years put himself apprentice in London by indenture, with the usual covenants, and afterwards ran away with his master's money, whereupon he brought an action of covenant; the defendant pleaded

pleaded nonage; the plaintiff replied, that by the custom of London an infant may bind himself *apprentice*, and in such covenants as are comprized in this indenture, and that he should be bound, &c. as if he was at full age, &c. and upon demurrer to this replication, it was objected, that this custom is pleadable only in the court of London, and not in the Common Pleas, or elsewhere; but adjudged otherwise. *Moor* 135.

Covenant against the defendant, being an *apprentice*, for imbezzling his master's goods: the defendant pleaded infancy when he became bound; the plaintiff replied, that the custom of London is, that one may bind himself *apprentice* at the age of fourteen years, &c. the defendant rejoined, that the custom is, that if one may bind himself *apprentice* at that age, and the indenture is inrolled in *Guildhall*, then it shall bind, and traversed the custom as alleged by the plaintiff: upon which they were at issue, and the court sent to the lord-mayor and aldermen, who certified by the mouth of their recorder, that the custom was as the plaintiff had declared. *Palm*. 361.

Error of a judgment upon the statute for using a trade, not having served an *apprenticeship*, &c. the action was brought in Newbury, and the error assigned was, that it ought to be brought in one of the courts at Westminster; and for that cause the judgment was reversed. *Style* 383.

Covenant upon an indenture of an *apprentice*, wherein he bound himself to serve the plaintiff for seven years; the plaintiff set forth the custom of London, that any person above fourteen and under twenty-one, and unmarried, might bind himself *apprentice*, &c. according to the custom, and that the master might have *tale remedium* against him, as if he had been twenty-one, and alleges, that the defendant did depart from his service *per quod* he lost his service for that term, which was not yet expired: the defendant pleaded a frivolous plea; and upon a demurrer, it was adjudged, that though such a covenant would not bind an infant, either at common law, or by the statute 5 *Eliz.* yet by custom it shall bind him; it is true, here the plaintiff declared for the loss of the defendant's service for seven years, part of which was yet to come, which had been naught after a verdict, but it is good upon a demurrer; because the plaintiff may take damages for the departure only, and not for the loss of the service during that time. 1 *Mod.* 271.

Covenant by an *apprentice*, for that the defendant's testator had covenanted to instruct him (the plaintiff) in the art of a saddler for seven years, and to find him in meat and drink during that term, and assigned the breach; for that after the death of the testator, the defendant, who was his executor, turned him (the plaintiff) out of doors, and out of his service, *et sic* did not find him meat and drink; and upon demurrer, the court inclined at first, that *et sic* was not a sufficient averment of the breach of covenant; but afterwards they held it *et sic* to be only matter of form, and that the *apprentice* remains to the executor; for though he might not instruct him, he must find him in meat and drink. 1 *Sid.* 216.

The plaintiff declared upon an indenture of *apprenticeship*; the defendant pleaded, that at the time of the executing the said indenture he was an infant; plaintiff replies, that by the custom of the city of London, if one under age binds himself *apprentice*, it shall oblige him; and upon demurrer to this replication, it was objected, that it was ill, because a departure from the declaration, for that is at common law, and by the replication he hath enabled himself by a custom; and so is the *abbot of Bokesfaj's case*, *Keilw.* 75. B. but adjudged no departure, for the action is founded on a covenant, and in the replication he only answers the disability in the plea. *Raym.* 16.

Covenant by an infant *per guardianum*, for he being *apprentice* to the defendant by indenture, he did not keep, maintain, and teach him the trade of a woollen-draper, as he ought by his covenant, but turned him away: the defendant pleaded an order of sessions, by which he was discharged from the plaintiff for his disorderly living, and that the order was inrolled; and upon demurrer to the plea, it was held, that the master might be discharged from his *apprentice* by an order of sessions; but it was a question, whether he ought first to make application to one justice, and not to the sessions *per saltum*. 1 *Vent.* 174.

In covenant, the plaintiff declared on the custom of London, that time out of mind, every freeman *solebat* to take an *apprentice*, who by custom, &c. are bound by their covenants faithfully to serve; and that he (the plaintiff) took the defendant *apprentice* by indenture, in which he covenanted to serve seven years, which he had not done; upon which they were at issue, and the plaintiff had a verdict: it was insisted in arrest of judgment, that the declaration was ill, because it was in the *soleit* alone, when it ought to be in the *debet* and *soleit*; for if he is bound to serve, it must be by the custom, because he is an infant; and if by the custom, then it must be *debet* and *soleit*; but adjudged, that he is bound by the covenant, and that the custom is only inducement. 1 *Lev.* 12.

The testator covenanted to teach an *apprentice* his trade; and in an action of covenant against his executor, it was insisted, after a verdict for the plaintiff, that the covenant was personal, and did not oblige the executor; but adjudged, that it did, and if the executor is not of the same trade, he ought to provide another master, who is. 1 *Lev.* 176.

In *debt on apprentice's bond*, that if *apprentices* should imbezzle, &c. if within twenty days after notice given thereof to defendant and one A, and proof to them made, &c. shewing to defendant and A a confession under hand of the *apprentice* is not proof sufficient, the *apprentice* being not *fide dignus*, and notice and proof ought to be given them both together, and not to one at one time, and the other at another time; plaintiff should shew in what place he became *apprentice*, and that he was such a person as might be *apprentice* by 5 *Eliz.* and though the statute is not pleaded, defendant shall take advantage thereof, because it is a general statute. *Cro. Eliz.* 723. pl. 55.

Bond was given for the truth and honesty of an *apprentice*; the master pretended goods were lost, and got the *apprentice* to sign a note as for particulars of the goods lost, and the value of them, but let the notes sleep for two or three years without acquainting the obligor with it: a bill was exhibited against the master to be relieved against the bond, and an issue was directed on a *quantum damnificatus*, but the note not to be given in evidence; and afterwards the defendant, the master, who was plaintiff in the action at law, being nonsuited upon full evidence, a perpetual injunction was decreed against the bond for all breaches past before the action brought by the master at law. *Finch. Rep.* 47.

A, a father, on putting out his son *apprentice* to B, was bound in a bond of 1000 l. penalty for his son's fidelity; the son imbezzles 203 l. which A paid, but desired B to trust the son no more with cash, or but very sparingly. About a year after, the son imbezzled about 300 l. more, and so it stood for several years, when upon account it appeared he had imbezzled 2750 l. but of this B gave no notice to A, till two years after *apprenticeship* ended. The master of the rolls decreed A to pay 1000 l. over and above the 203 l. before paid; but lord chief justice King decreed the payment of so much as would make it in all 1000 l. and the 203 l. to be as part of it. 2 *P. Williams* 288.

Regulations of apprentices to masters of ships, &c.

Boys above ten years of age chargeable to any parish may, by the justices, mayors, church-wardens, &c. be bound *apprentice* to masters of ships, till the age of twenty-one years: their ages to be inserted in their indentures. 2 and 3 *Ann. c. 6. sect. 1.*

The indentures to be sent to the collector of the customs, at the port to which the master belongs, who is to register and indorse the same, on forfeiture of 5 l. and to transmit certificates of their names, ages, and to what ship belonging, to the admiralty. 2 and 3 *Ann. c. 6. sect. 5, 13, 15.*

Parish-boys bound *apprentices* may, by consent of the justices, &c. be turned over to the sea-service, for the remaining time; but their indentures of assignment must be registered, &c. 2 and 3 *Ann. c. 6. sect. 6.*

The counter-part of their indentures to be sealed and executed in the presence of, and attested by the collector and the officer who brought them; which officer is to transmit

transmit such counter-part to the church-wardens, &c. 2 and 3 *Ann. cap. 6. sect. 11.*

Such boys not to be impressed, nor listed in his majesty's service, till they be eighteen years of age. 2 and 3 *Ann. c. 6. sect. 4, 5.*

Ships from thirty to fifty tons to take one such, from fifty to a hundred tons two such, and one more for every hundred tons they carry above that. Masters refusing to take them accordingly, forfeit 10l. 2 and 3 *Ann. c. 6. sect. 8.*

Masters after their arrival, and before clearing, to certify to the collector, the number of such apprentices aboard. 2 and 3 *Ann. c. 6. sect. 9.*

Collectors to transmit an account of all such apprentices to the quarter-sessions, &c. when required, on forfeiture of 5l. 2 and 3 *Ann. c. 6. sect. 13.*

Collectors to insert at the bottom of the cocket, the number of the men and boys on board each ship, describing such apprentices particularly, their names, ages, and dates of their indentures. 2 and 3 *Ann. cap. 6. sect. 14.*

Persons voluntarily binding themselves to the sea-service, may not be impress for three years, and to have protections accordingly. 2 and 3 *Ann. c. 6. sect. 15.*

An indenture of apprenticeship.

This indenture made the day and year, &c. witnesseth, That A. B. son of, &c. hath of his own free and voluntary will, placed and bound himself apprentice unto C. D. of, &c. to be taught in the trade, science, or occupation of, &c. which he the said C. D. now useth, and with him as an apprentice to dwell, continue, and serve him from the day of the date hereof, untill the full end and term of seven years; from thence next ensuing, and fully to be compleat and ended; during all which term of seven years, the said apprentice his said master well and faithfully shall serve, his secrets keep, his lawful commands every where gladly do; hurt to his said master he shall not do, nor wilfully suffer to be done by others, but of the same to his power shall forthwith give notice to his said master; the goods of his said master he shall not embezzle or waste, nor them lend without his consent to any; at cards, dice, or any other unlawful games, he shall not play; taverns or alehouses he shall not frequent; fornication he shall not commit; matrimony he shall not contract; from the service of his said master he shall not at any time depart or absent himself, without his said master's leave; but in all things, as a good and faithful apprentice, shall and will demean and behave himself towards his said master, and all his, during the said term. And the master his said apprentice the said trade, science, or occupation of, &c. which he now useth, with all things thereunto belonging, shall and will teach and instruct, or cause to be well and sufficiently taught and instructed, after the best way and manner that he can; and shall and will also find and allow unto his said apprentice, meat, drink, washing, lodging, and apparel, both linen and woollen, and all other necessities fit and convenient for such an apprentice, during the term aforesaid; and at the end of the said term, shall and will give to the said apprentice, one new suit of apparel, &c. In witness, &c.

APPURTENANCES, signify things both corporeal and incorporeal appertaining unto another thing as principal: as hamlets to a chief manor; and common of pasture, piscary, &c. also liberties and services of tenants. *Brit. c. 39.* If a man grant common of estovers to be burnt in his manor, these are *appurtenant* to the manor; for things *appurtenant* may be granted at this day. *Co. Litt. 121.* Common *appurtenant* may be to a house, pasture, &c. out-houses, yards, orchards, and gardens are *appurtenances* to a messuage; but lands cannot properly be said to be *appurtenant* to a messuage. 1 *Lill. Abr. 91.* And the messuage cannot be *appurtenant* to another. *Ibid.* Lands cannot, according to the right sense of the words *cum pertinentiis*, be *appurtenant* to the house; but the word *pertinens* may be taken in the sense of usually lett or occupied with the house. *Plowd. 170.* Lands shall pass in a lease, or devise of a house, with the *appurtenances*, as pertaining to the same, when it hath been used and

occupied with it ten years or more; which is judged a sufficient time to make it appertaining to the house. *Cro. El. 704.* Lands, a common, &c. may be *appurtenant* to a house, though not away. 3 *Salk. 40.* Grant of a manor, with the words *cum pertinentiis*, it is said will pass all things belonging to the manor. *Owen's Rep. 31.*

Adjudged that where a man hath a thing appertaining to a house or mill, the most durable thing is the land, being the foundation on which it is built, therefore though the house or mill falls by the act of the owner or another, yet because the most durable part remains, he may build it again without the loss of the appendancy or *appurtenance*, but then it must be built upon the old foundation. 4 *Rep. 86.* *Lutterell's case.*

So a devise of an house, with the *appurtenances*, and the devisee claimed some land in the field by virtue of this devise; and adjudged that he might have it, if it had been used with the house for the space of ten years, or more, for that should be sufficient time to make it appertaining to the house. *Cro. Eliz. 704.* *Yates versus Clanrickard.* *Moor 221.* *Higham versus Horwood, S. P. 1 Leon. 34.* *S. C. Godbolt 40. S. C. Cro. Eliz. 16.* 6 *Rep. 64. a. contra.* 3 *Leon. 214.* *Chard versus Tuck, S. P. Cro. Eliz. 89. S. P.*

Three *coparceners* of a manor to which a leet did appertain; the king purchased two parts of the manor with the *appurtenances*: adjudged, that the leet is not extinguished, but remains appendant to the other third part; for the king had not all the leet by the alienation of the two sisters, but shall hold court with the third. 1 *Aud. 26.*

Trespas for entering his close, and taking and carrying away his hay; the defendant justified under a title to the land where the hay did grow; for that there was a chapel dissolved in the reign of Edward VI. and the possessions thereof (of which this land was parcel) descended to the queen, who in the thirty-second year of her reign, made a lease thereof by the name of all that chapel *de A. fundatum in ecclesia de B. cum pertinentiis*, under which lease the defendant claimed the tithes; and upon a demurrer to this plea, it was objected, that it was ill, because it is not said, that the tithes did grow on the lands belonging to the chapel: *sed per curiam*, By the grant of the chapel *cum pertinentiis* all the tithes belonging to it shall pass. 2 *Roll. Rep. 150.* *Grubham versus Grate.*

A copyholder for life, who had right of common in the lord's waste, purchased the freehold, which was granted to him with the *appurtenances*; adjudged, that by making it a freehold, the common which was annexed to the customary estate was destroyed, and that by his own act, and that it shall not be revived by those general words in the grant *cum pertinentiis*, without some special words to pass it again. 2 *Cro. 253.* *Marshall v. Hunter. Postea Common. (E. 2) S. C. Cro. Eliz. 794. contra.*

In replevin, &c. The defendant avowed, that G. D. was seized of an house in C. in fee, and of several lands, &c. to the same appertaining, whereof the *locus in quo* was parcel; exception was taken to this avowry, because land cannot properly be said to appertain to an house; it is true, it may pass by such words in a deed, but in pleading it ought not to be so alledged; and so it was adjudged. *Cro. Eliz. 919.* *Willmot v. Carne.*

Certain lands came to H. VIII. upon the dissolution of a priory, who demised the same to B. B. for years; the lessee built an house upon these lands, which afterwards came to queen Elizabeth, and she granted all that messuage, and the lands thereunto belonging: adjudged, that though the house was not built on the lands when demised by Henry VIII. but afterwards, and before the queen granted the same, yet the grant is good, and the lands may be properly said to be appertaining to a house, when they have been let and enjoyed with the house a convenient time. *Cro. Car. 120, 168.* *Jennings v. Lake. Postea pl. 8. S. P.*

In ejectment, &c. the case was, a copyholder in fee of a tenement called Heyham's, built a new building on six foot of the waste, which he did by encroachment, and afterwards the lord of the manor made a lease of the six foot, so built on by the copyholder for 100 years; this lease was made anno 33 *Eliz.* and afterwards the copyholder, anno 1 *Jac.* surrendered the said tenement called Heyham's, to the use of B. B. and his heirs, and anno 5 *Jac.* assigned all his term in the said six foot to the said B. B. who by in-

denture, anno 19 *fac.* made a lease of the said tenement called *Heybam's*, with the *appurtenances*, to *E. W.* for seventy years: adjudged, that the new building on the six foot of waste ground did not pass by the word *appurtenances*; for it being built anno 33 *Eliz.* and it being not found that it had been used altogether with the tenement, or reputed as parcel thereof, nothing passed but what was parcel of the tenement at that time; but in a devise it might have been otherwise. *Cro. Car. 12. Brian versus Witherland.*

By the later authorities, lands will not pass by the word *appurtenances*, but only such things which do properly belong to the house; as where a man was seized of two houses and of eighty acres of land belonging to one of them, known by a particular name, and made a feoffment of the house and eighty acres to *B. B.* who made another feoffment to the said feoffor, by which he took back the same house and lands, and forty acres more by another name; and about ten years afterwards he devised this house and all the lands thereunto appertaining, to his youngest son; adjudged, that though he used the forty acres with the house for ten years and more, yet it would not pass by these words thereunto appertaining, because they were conveyed to him by a new name. *Palm. 375. Loftus versus Baker. Godb. 352. S. C. reported by the name of Knight's case. Cro. Car. 57. Hearn v. Allen, S. P. Hull 85. S. C. Litt. Rep. 8. S. C.*

Upon a demurrer to an English bill, in the Exchequer, it was held by Hale chief baron, that return of writs may be claimed by prescription as appertaining to a manor, but more especially it may as appertaining to an honour; because those have larger incidents than manors, and that where the pernor of the profits is sued, the plaintiff need not shew how he claims this privilege; but in a *quo warranto*, where the defendant must make a title, he must shew how he claims it. *Hardres 423. Countess of Pembroke v. Lord Burlington.*

The testator had a house and a kiln built upon distant parts of a close, and also two mills to make oatmeal, adjoining to the said close, which were used with the house for several years, but were lately divided; then he sold the house with the *appurtenances*, and part of the close to one, and devised the mills with the *appurtenances* to another: adjudged, that the kiln did not pass; for by the grant of the house with the *appurtenances*, nothing passed but what properly belonged to the house. *1 Lev. 131. Archer v. Bennet.*

Trespass for digging turfs in his soil, the defendant justified by a grant of the lord of the manor to *T. S.* and his heirs, to dig turfs there to be burned in his house, and that *T. S.* granted the house *cum pertinentiis* to the defendant and his heirs: adjudged, that the *turbary* passed by these words, without being especially named, as *common appurtenant* may, because it passed with the lands to which it is *appurtenant*. *3 Lev. 165. Solmes v. Bullock.*

In a special verdict in ejectment the case was, That 1 *August*, 1606. King James was seized in fee, in right of the crown, of a pool of water and three gardens, in the parish of *St. Margaret, Westminster*, and that a water-work was then erected in the said gardens, and that the pool was used with the water-work, till 12 *March*, 11 *fac.* and then the king by letters patent did grant the gardens with the water-works and *appurtenances*, & *omnia stagna, gurgites*, &c. to the premises appertaining; the question, whether the soil passed by the words *stagnum* or *gurgites*, or either of them; if it did, then whether it passed as appertaining to the water-work, built anno 6 *fac.* and passed away with the pool as appertaining to it, anno 11 *fac.* or as appertaining to the gardens; which seems in a short time to gain a reputation, as appertaining, &c. adjudged, that by the word *stagnum*, the water and soil passeth; and as to the word *appertaining*, a thing may be said to be appertaining in relation to the extent of the grant, as where an ancient messuage is granted with the lands thereunto belonging; now, if some lands were of late years occupied with that messuage, it may be a question, whether those lands pass by the word *appertaining*; but it is a question only what was intended to pass, and that relates to the extent of the grant; but in the principal case the word *appertaining* relates to the thing granted, and without which it could not be used, and in such case it is *appertaining*

immediately, and as soon as it is annexed to it; and therefore the jury having found that the water-work could not work *sine stagno prædicto*; they find that the water and soil, which is comprehended by the word *stagnum*, was necessary for the work, and it could not work without it. *Vaugh. 107, 110. Price v. Braham.*

AQUA FORTIS, and the spirit of nitre are the same, and differ only in the manner of making. The former is distilled with vitriol and colcothar, the other with clay, bole, oil of vitriol, brick dust, &c.

The generality of assay-masters use *aqua fortis*, as being more easily prepared, by reason that a quantity of vitriol, much less than the terrestrial mixture before-mentioned, and with less fire, separates the spirit out of the same quantity of nitre.

The distillation of *aqua fortis* is performed as follows; viz.

Put vitriol into an earthen, or iron pot: if you make a fire under it, the vitriol begins to melt and smoke; by encreasing the fire gradually, it thickens and assumes an ash-colour. Let it be stirrid with a rod just before it becomes solid, till it be perfectly dry; but let it be taken as yet boiling out of the pot, for, if it grows cold therein, it will stick so fast that you will hardly be able to get it out. Pound to a subtle powder three pounds weight of this calcined vitriol, and mix them well with four pounds of nitre well dried, and pulverized very fine. Put these together in a cucurbit, or retort, or an iron pot, and then put it in a furnace.

At first let the fire be made not much greater than is necessary to boil water. When the receiver grows warm, continue the same degree of fire, till all the phlegm is expelled, which you will know from the diminution of the heat of the receiver: encrease the fire gradually, till you see a few yellow vapours arise. Keep up the same fire for an hour or two, and make it so strong as to warm the vessels moderately. Continue this for some hours, and, letting the vessels cool, pour the liquor, now emitting reddish fumes, out of the receiver into a glass vessel, having a glass stopple: this liquor, thus prepared, is your *aqua fortis*.

Use and application of aqua fortis in divers cases.

1. In this operation you must always proportion the duration of the degrees of your fire to the quantity of the matter to be distilled.

2. For security's sake you must leave within the receiver and vessel that contains the matter to be distilled, a hole, which may be stopped and opened with a wooden peg; for, if you happen to exceed the just degree of fire, especially in the beginning of the operation, the first and more subtle spirits, which are very elastic, come forth; the opening, therefore, of the hole may give them a passage, lest the vessels burst, which would be very dangerous.

3. The better your nitre is refined, the better will the *aqua fortis* be. Avoid carefully the mixture of sea-salt therewith, for the reason we shall give, when we treat of *aqua regia*.

4. There are many ingredients used in the making of *aqua fortis*, such as burnt allum, sand, and the like; the reason whereof is, to hinder the species, which may happen not to be sufficiently calcined, from foaming, and from breaking the vessel with great violence. But, when these species are duly calcined and dried, these additions are quite needless; and indeed, by overfilling the mass to be distilled, requires vessels of a size proportionable.

5. There are many other needless and noxious ingredients used by some in the making of *aqua fortis*. These are blood-stones, unslaked lime, allum plumosum, &c. all which should be avoided, as they make a much worse, as well as a more expensive *aqua fortis*. Water thus made, therefore, should never be used in doctrinal operations, before it has been accurately tried: for *aqua fortis* being tainted with these heterogeneous matters, the major part of it consumes away, and becomes frequently so fixed, that the strongest fire is hardly able to take off any of it. Nothing should be used besides calcined vitriol, intimately mixed with nitre, there being no need of any thing else.

6. However, bole, clay, and brick-dust, do expel *aqua fortis* out of nitre, which then is called the *spiritus nitri*; but you must add four times as much of these, in proportion

tion to the nitre; consequently, this method, requiring larger vessels and more fire, cannot be so profitable as without these ingredients.

7. As the extracted spirits of nitre are with difficulty condensed into drops, especially in sultry weather, it will be proper, by reason of the calcined ingredients, to pour into the receiver, one quarter part of pure water, or rather of the phlegm, extracted out of the *aqua fortis*; by which means the spirits will be much easier received.

8. *Aqua fortis* dissolves and corrodes all gritty stones, and the several kinds of those that are vitrifiable, and not consumed by fire; but it has no power on flints nor sand.

It also dissolves iron, copper, lead, silver, mercury, regulus of antimony, bismuth, and zink; tin imperfectly; gold not at all.

10. Common *aqua fortis*, when poured on silver, generally grows troubled in the beginning of the dissolution; a little after the dissolution is perfect, a precipitation of a whitish powder being made.

If this powder, taken by itself, melts in the fire with pot-ash, you will find a regulus of silver collected. This sometimes melts with difficulty in the fire, and has all the characteristics of calx of silver precipitated from *aqua fortis*, by oil of vitriol.

This happens, because the *aqua fortis* has been extracted by too great and too lasting a fire, or because too great a quantity of calcined vitriol has been used, or because the mixture of the nitre and vitriol has not been rightly made: for, in these cases, these appear, when the distillation draws to an end, opaque, milky, vitriolic fumes in the receiver; which phenomena sufficiently manifest the cause of the aforesaid precipitation. The above-mentioned calx very seldom proves fluid in the fire; it afterwards turns into horn-silver, and shews that the impure nitre, bought for the distillation of the *aqua fortis*, was intermixed with marine salt, which adulteration should be carefully guarded against.

11. As the dissolution of silver, especially, that by which gold is separated from silver with *aqua fortis*, is considerably hindered, and made very uncertain, by this kind of precipitation before-mentioned; that part of the oil of vitriol, and of the spirit of salt, which spoil the *aqua fortis*, must be separated; which is done in the following manner.

Pour about one thirtieth, or one fortieth part of the *aqua fortis* to be purified, into a small cucurbit, and over a gentle fire dissolve silver in it, to such a quantity as may fully saturate the *aqua fortis*. If in the beginning of the dissolution the troubled *aqua fortis* looks milky, it wants purification: then pass through a filtre the warm dissolution, which, being clear, pour, drop by drop into the rest of the *aqua fortis* that is to be purified: this will become milky, as before; continue to infill the *aqua fortis* till the dropping in of the smallest drop doth not at all disturb it, or render it milky. Let it rest for some hours, that the precipitated calx may subside; which done, again let a drop fall, and repeat it constantly, till at last the milky cloud is no longer produced by the falling of the drop. Decant the pure and limpid *aqua fortis* from the calx which subsided at the bottom, or strain it gently through a four-folded filtering paper, which ought to be small, lest it should break by being overloaded with too much of the *aqua fortis*. The remaining calx is such as we have mentioned in remark 10, and the *aqua fortis* is perfectly purified for use.

12. Some are wont to use common silver mixed with copper, or copper alone, for the precipitation of the spirit of marine, or vitriolic salts, from *aqua fortis*: but this does not succeed, when the spirit of marine salt is to be precipitated, because this being mixed with *aqua fortis* dissolves copper perfectly. The oil of vitriol is, indeed, expelled from *aqua fortis* by means of the copper, in the form of a whitish dust, but not so perfectly as by silver; otherwise it appears in this operation, that the precipitating body adheres to that to be precipitated, and sinks to the bottom together with it, and therefore cannot be a proper precipitator on this occasion.

13. The best *aqua fortis* is often tinged with a greenish colour, occasioned by being exposed for some days to the open air, and thus deprived of its fuming red spirit, by pouring upon it some fresh strong *aqua fortis*, still emitting its fumes; or by being diluted with water.

That you may be certain this colour does not proceed from copper, pour a little of the liquor into a small cucurbit, and add to it as much of an alkaline dissolution, or spirit, as is sufficient to saturate the acid: if there is ever so little copper, the colour becomes of a very dark azure, with a cloudy precipitation; because the nitre has been thereby regenerated, which does not dissolve copper so much as *aqua fortis* does: but, if there is no copper, the colour vanishes entirely.

14. *Aqua fortis*, prepared and corrected according to what has been said, must be concentrated to a certain degree: for, if it is too weak, it either retards the dissolution, or often does not even affect the silver.

If, on the contrary, it is too strong, it vanishes into fumes, which rush violently out of the vessels, though sufficiently deep, hurrying part of the silver along with them; but, if there is any thing of gold in the silver, it is corroded into a dust, the perfect collection of which is afterwards very difficult. The first fault is remedied by pouring the *aqua fortis* into a deeper cucurbit, and by extracting the phlegm out of it, over a gentle fire, till you see yellowish fumes appear; but, to find out whether it is too strong, you are to use the following method:

Melt together one part of gold and four parts of silver, of which make a plate, which you are to cut into three, or more parts: roll up each part, that it may more conveniently be introduced into a small cucurbit: when rolled up, and slightly heated at the fire, put this small plate into the said cucurbit; pour upon it *aqua fortis*, about the triple of the weight of the metal, and put it on a gentle fire: if then the silver is eroded from the gold, so that the gold remaining retains the very same figure of the plate rolled up, and there appears no reddish dust at the bottom of the vessel, then the *aqua fortis* has the proper degree of strength; but, if the dissolution has been made with so much violence that the powder of the gold was eroded, or the plate almost broken, the *aqua fortis* is too strong. In this case you must dilute it with one tenth or eighth part of pure water, or rather of weaker *aqua fortis*, or of the phlegm that was extracted from it: which done, you must repeat the trial of the dissolution of a like small plate, several times over, till the silver be dissolved, without the least diminution in the gold, whereby you may be sure of the requisite degree of strength in your *aqua fortis*.

15. *Aqua fortis* is excellent when it comes again, after having been by fire expelled out of dissolved metal, because it may be almost entirely fetched out of it by distillation. In order to this, you introduce into a middle-sized glass cucurbit, fitted to an alembic, with an hole in it, one pound, or one half pound, of the same dissolution, and distill it into a large receiver, that the drops may fall one after the other, at the interval of some seconds: when the phlegm of what remains shall be drawn off to some ounces, let the like quantity of a fresh dissolution, gently warmed, be put anew into the cucurbit, and be drawn off again; and let the pouring on of the fresh dissolution be reiterated in the same manner, till it is all grown thick.

This must be done in a small cucurbit, several times over; lest a large vessel, being overcharged with too great a quantity of the dissolution, should burst all of a sudden, and the *aqua fortis* and metal be lost at once. When, after the extracting of all the phlegm, yellowish fumes begin to appear by increasing the fire a little, let a drachm, or half a drachm of fuel be added, lest the remaining metal, being dried up, should so strongly adhere to the sides of the vessel as that it could not be taken off: when at last the mass shall be quite dry, let it be put on the fire, till it becomes red hot. The calx of metal which remains at the bottom of the cucurbit must be collected, and melted with pot-ash, or borax.

16. When pure fine silver is dissolved in *proof aqua fortis*, the liquor will be pellucid: but, if any alloy, or copper, remain mixed with it, the solution will have a bluish or greenish cast. If this solution of perfectly pure silver be diluted with fair water, it will still remain pellucid, without letting any thing precipitate. But, if any saline matter be contained in the water, the whole will turn thick, or milky. The solution of pure silver properly

properly weakened with water occasionally, may be commodiously used for staining the skin, or other animal substances, black; and if white, grey, or red hair be moistened with it, the hair will soon become of a beautiful brown, or jet-black colour; for which purpose it may be used with safety, care being taken not to touch the skin therewith, for thus a blackness would be occasioned, that requires many days before it goes off again; but it disappears at length, by the 'scarf-skin scaling off, without causing pain, or leaving any sore behind.

17. The solution of pure silver has an intolerable bitter taste, though by the eye it be not distinguishable from fair water: whence we have an eminent instance how metals may be concealed from the sight, or remain lodged in unsuspected liquors, and thence be introduced invisibly into other substances; whence the greater caution should be used by all pretenders to the melioration and transmutation of metals.

This solution of silver is the foundation of several medicinal and chemical preparations, as the vitriol of silver, the lunar caustic, the silver pill, &c.

19. The silver is recoverable from the solution, barely by suspending a copper-plate therein: for, copper being more easily dissolved by *aqua fortis* than silver, the silver is therefore precipitated to the bottom, in the form of a powder, and being washed and melted, comes into a metalline lump again.

20. *Faschius* says, in treating of the sediment of department waters, that if gold, by quartation, be mixed with silver, and again separated from it by *aqua fortis*, it will constantly be found to have encreased its weight, which encrease he attributes to the silver adhering to the gold; but it still remains for experiment to decide, whether this additional weight be truly owing to the silver, or whether it be an encrease of real gold. For more matter hereon, see the articles *REFINING*, and *GOLD* and *SILVER*.

21. *Aqua fortis* is also used as an instrument in gilding. See the article *GILDING*.

It is applicable to the art of dying likewise. See the article *DYING*.

The spirit of nitre is found to heighten and improve the rich colour of cochineal into the brightness of burning fire; but then its acrimony must be rectified with a proper application of tin, after which it neither hurts wool nor silk, yet retains all its brightness.

Great quantities of *aqua fortis* were annually exported from England to France and Flanders; but within these few years, the demand has been inconsiderable. *Murray*, who fled from a commission of Bankruptcy, and was formerly manager of the *aqua fortis* and copperas-works at *Deptford*, has established very large works near Brussels, under the sanction, and with the assistance of the government at Brussels, and has succeeded so well, that these works will prove greatly detrimental to this branch of commerce in England, *Murray* being enabled to sell his *aqua fortis*, oil of vitriol, and copperas, much cheaper to the Flemings, the French, and the Dutch, than it can be exported from England.

AQUA SECUNDA, is *aqua fortis* which has lost part of its dissolving quality, after being used in the parting of metals.

AQUA REGIA, or *aqua regalis*, or *aqua regis*, as some call it, is a strong corrosive spirit, which dissolves gold. The method of making it is as follows, viz.

When the spirit of nitre is duly prepared, as under the head *aqua fortis*, the spirit of sea-salt must also be prepared. See that article under *SALT*.

When these two spirits are mixed together, the mixture is called *aqua regia*. Or, to have it excellent, put into a glass retort *aqua fortis* of the best kind, well proved, and of the requisite strength, according to what has been said under *aqua fortis*; add to it half the quantity of common salt, perfectly dry, and pulverized; in a sand-bath force up the spirits, first, by a slow, and afterwards by a strong distillation. Or, if you put into *aqua fortis* one quarter-part of salt ammoniac, it immediately assumes a yellow colour, and emits abundantly the white vapours of the spirits of salt, which soon produces true *aqua regia*.

However, you are to take care, in this second method,

that the vessel containing the mixture be not presently shut up close; for in that case it would burst. Besides, this mixture must be made under the chimney, lest the suffocating spirits should spread all over, and fill the laboratory, and prove injurious to the operators.

Aqua regia dissolves perfectly iron, copper, tin, gold, mercury, regulus of antimony, bismuth, and zink; it dissolves even lead more than spirit of salt does; it becomes, however, somewhat troubled in the operation.

If it has its requisite degree of strength, it does not dissolve silver; but, if you put into it a quantity of salt ammoniac, or of marine salt, or of spirit of common salt, it will then corrode silver, nay, even dissolve it in part.

The reason is self-evident why, in the separation of silver and gold by *aqua regia*, it is better to use a quantity of spirit of salt, or of marine salt, or of salt ammoniac, exceeding, than short, of the right measure: nor is it less evident, why an exact separation of silver and gold is better effected with *aqua fortis* than with *aqua regia*; as the former never corrodes gold, whereas the latter corrodes silver frequently.

The solution of gold by *aqua regia* is yellow, or gold-coloured, and tinges the skin purple, and if the solution of gold be precipitated with salt of tartar, and the powder be carefully dried, it makes the *aurum fulminans*, so called from the violent explosion it goes off with, when heated beyond a certain degree. See the article *GOLD*.

If the gold be dissolved in *aqua regia*, made by distillation from equal parts of salt-ammoniac, and nitre, either with or without powdered brick, or calcined flints, and the solution be digested, and several times cohobated, with the addition of fresh liquor, *Becher* assures us, the gold will thus become totally volatile. *Reset. Chymic. exp. 2. p. 192.*

A similar, or still more potent menstruum, is given us by *Cassius*, *Traclat. de Auro*, p. 101. who, mixing pure nitre with oil of vitriol, thence distilled a spirit, and, obtaining another in the same manner from common salt, joined the two spirits together. In this species of *aqua regia* he dissolves gold, then draws off the menstruum, till a melaginous substance remains behind, to which he again adds as much of the *aqua regia* as makes up the former quantity; then again abstracts, and so repeats his cohobation thrice. Lastly, he mixes, along with the remaining melaginous matter, twice its weight of well dephlegmated oil of vitriol, and, by distilling it in a strong heat of sand, there ascended, as he expresses it, most elegant rubies; which expression is not so extravagant as it may appear: for *Kunkel* also tells us, that, by pouring a little oil of vitriol into a solution of gold, and distilling it over with a strong fire at last, a portion of the gold will not only ascend in the form of red drops, but also sublime to the top of the cucurbit, in the appearance of feathers, or flowers, tinged of a most beautiful red: but if these flowers are exposed to the open air, they will again run into a yellow-coloured liquor. *Kunkel, contra non entia Chymic. p. 105.*

The aforesaid *Cassius* proposes likewise a more expeditious method of volatilizing gold, by means of the smoaking spirit, which in the space of an hour, sublimes it into yellow flowers. In order to this, he evaporates a solution of gold made with *aqua regia*, till it leaves only a little purple cake behind; upon this he pours the smoaking spirit: then, clapping the head upon the cucurbit, he distils in hot sand; and, as soon as ever the matter comes to be agitated by the heat, the smoaking spirit very impetuously carries up the particles of the gold, and sublimes along with them into yellow round flowers.

There are certain other powders, or crocuses, prepared from gold, called *croci solis*, being principally of three different colours, and having four different uses.

The first is a black, or dusky powder, that serves for extemporaneous gilding: the second is of a saffron colour, being made with *aqua regia*, by exhalation, commonly called the *calx* of gold, and serving for various purposes of amalgamations and extractions: the third, made with *aqua regia* by precipitation, is of a yellow colour, and called *aurum fulminans*, which is of use in medicine: and the fourth is a purple powder, made of the *aurum fulminans*.

The manner of preparing the first is thus: having made a solution of gold in five or six times its quantity of common *aqua regia*, let clean linen cloths be dipped therein and dried, continuing, or repeating, the operation till all is soaked up. There put the cloths into a little crucible; and burn them with a small and gentle ignition, and keep the remaining matter for use, under the form of a fine black powder; a little of which being taken up with a wet cork, and rubbed upon a plate of silver, will immediately gild over the metal; though it must be observed, that more gold is consumed in this way than in the common of gilding by amalgam. See the article GILDING.

The second, or saffron-coloured *calx* of gold, is made by distilling, or evaporating to dryness, a solution of the metal made in *aqua regia*; the fire being at last encreased, so as gently to ignite the remaining matter.

The third, or yellow *calx* of gold, is prepared by gently pouring oil of tartar, *per deliquium* into a solution of the metal made with such *aqua regia* as contains falt-ammoniac, by which means the gold is precipitated in the form of a yellow powder. After the liquor, therefore, has stood a proper time to subside, the clear part thereof that floats above the powder is decanted, and the sediment several timesedulcorated with hot water, and at last permitted to dry with a very mild and gentle heat.

If a little of this powder be laid upon an iron, or any other metalline plate, placed over a candle, or burning coals, it takes fire, and goes off with a very brisk report, and so strong an impetus, as to strike a remarkable cavity into the plate. From which phenomenon some have imagined that this powder had a tendency, contrary to that of fire, though in reality, the explosion is made *ab aquavivum*, or in all dimensions alike. See Boyle's *Abridgement*, vol. ii. page 519; and *Memoires de l'Acad. de Scienc. ann. 1719*.

The fourth is made by mixing, or gently grinding, common sulphur, or the flowers of it, along with this *aurum fulminans*, and afterwards melting the mixture with a gentle heat, which at last is to be so far encreased, as to set on fire, and burn out the sulphur, whence a purple powder will be left behind.

AQUA SIMPLEX, or simple water, is *aqua fortis* that has been distilled, and has nothing left but phlegm. It is used in the mint, and by silver-smiths, in order to begin to soften the grains of silver.

AQUA EXTINGUATA, or extinguished water, is *aqua fortis* into which some river water has been poured, in order to qualify it, and render it less corrosive. Its use is to get the silver from the *aqua fortis* that served to part gold from it.

AQUA MARINA, a precious stone found on some parts of the coast of the ocean. It is of a pretty beautiful sea-green, which it is thought to acquire by being tossed up and down on the sand by the tide's ebbing and flowing. It is almost as hard as the oriental amethyst. See AMETHYST.

AQUA VITÆ, is commonly understood of what is otherwise called brandy, or spirit of wine, either simple, or prepared with aromatics.

Some, however, distinguish between them, appropriating the term brandy to what is drawn from wine, or the grape, and *aqua vitæ* to that drawn after the same manner, from malt, &c.

Brandy, *aqua vitæ*, spirits, or distilled waters may be imported. 5 and 6 W. and M. cap. 2. *sect. 2*.

Aqua vitæ, single or double, imported in casks not containing sixty gallons at the least, forfeited, or the value. 4 and 5 W. and M. cap. 5. *sect. 8*.

AQUATIC, something belonging to, or that lives in in, or near the water.

Thus animals or plants which live or grow in the water are called aquatic animals and plants.

AQUIFOLIUM, the holly-tree. From the bark of the holly is made bird-lime, and the wood is used by the turners for many of their wares, being very hard and white, and polishing very smooth.

AQUILA, in chemistry, has several significations; as spirit of mercury, arsenic, sulphur, the philosopher's stone; sal ammoniac also is called *aquila*, because of its

levity in sublimation; and Paracelsus often uses it to signify *mercurius præcipitatus*.

ARABIA is a country of very considerable extent, reaching from 13 degrees to 13½ of latitude, and from 43 to 60 of east longitude; that is, 22½ degrees, or 1350 miles from north to south, and 27 degrees, or 1620 miles from east to west. Some modern geographers give it a much greater extent, and others a less; and considering how little we are acquainted with that country, it is no wonder if we find some difference amongst those who have written of it. Whatever its true breadth is, which is computed from Jodda on the west, to cape Rosfelda on the east; it is much contracted in the middle and both ends, especially on the north side, where it runs into a narrow point between Syria and Palestine, and Diarbeck. Arabia lies between the second, third, fourth, and fifth climates; so that their longest day in the south is about fourteen hours and a half, and in the north eighteen hours and a half. This vast difference of climates, joined to the nature of the soil in many parts of it, makes the country to be mostly barren, hot, and dry; to afford but little sustenance to man or beast, and consequently to be thinly inhabited. Such as it is, it is bounded on the east by the Arabian or Persian gulph, and part of the Arabian sea; on the west by the Red-Sea; on the north by Palestine and Syria-Proprie; and on the south by part of the main ocean.

This country has all along preserved its ancient name amongst other nations; but when it had it is not agreed. Some derive it from the Hebrew עֲרָבִי, *Harabi*, which signifies a robber or free-booter, as that nation is known to have always been; others from another signification of that Hebrew word implying mixture, or a mixt multitude, which sense is no less agreeable to their character; for there is no room to doubt but that they have been much intermingled with other nations, and are accordingly styled by the prophet *Jeremiah*, the mixed people that dwell in the wilderness. They were again mingled with the *Saracens*, whose name imports both a thief and an inhabitant of the desert; to say nothing of those *Canaanites*, who likewise incorporated with them on being driven out of their country by the Israelites.

This country, though so very large and remote, is perhaps the best described by ancient geographers of any in Asia, which is the more remarkable, as its inhabitants are not known to have made any figure in the world, till the decline of the Roman empire, when *Heraclius*, then emperor of the East, made use of them against the Persians, and formed them to military discipline, of which they appear to have been quite ignorant till then. The whole country is by both ancients and moderns divided into, 1. *Arabia Deserta*, or *Desert*. 2. *Arabia Petraea*, or *Stony*. 3. *Arabia Felix*, or *Happy*. Joined together, they make the largest peninsula in the known world, and under some of the hottest climates of it; part being under the torrid zone, and the tropic of Cancer passing over *Arabia Felix*. The air on the northern part is vastly hot during the six summer months, the sky being seldom overcast with clouds; but on the southern it is much more temperate, being qualified with refreshing dews, which fall almost every night in great abundance. The very names of the three *Arabias*, as lying between the second and fifth climates, sufficiently declare the nature of their soil; the northern being extremely barren, and incumbered with high formidable rocks, the other overspread with vast mountains of sand; but the southern, deservedly stiled the *Happy*, is blessed with an excellent soil, and is extraordinary fertile in many places. Yet, upon the whole, the country is but poorly watered, having very few fountains, springs, or rivers, and these small and shallow, and very little rain, or any other moistening to the land than the dews just mentioned: and, though a little is sufficient to satisfy nature, yet the far greater part of the country does not yield enough for its support; the best of it is found about the sea-coasts, and along the banks of rivers, which are consequently better inhabited; but here even they are obliged to hold most of their markets in the night, by reason of the excessive heat of the day.

The product of *Arabia* is aloes, cassia, spikenard, frankincense, myrrh, manna, and other valuable gums; cinnamon, pepper, cardamum, dates, oranges, lemons, pomegranates, figs, and other fruits; honey and wax in plenty; and in their seas they have great quantities of the best coral and pearls. Among other domestic animals in this country, the camels, which it breeds in great numbers, are of singular use for carriage, especially for the caravans, and seem purposely created by divine providence for this dry and sultry soil, which affords no water in many days travelling. This creature is so formed and supplied by nature, that it can through up the liquids of its stomach into its throat, so that during three days it requires no water, and can even subsist a whole fortnight without any. The camels usually carry six hundred weight upon their backs, which need never be taken off during the whole journey; for they naturally kneel down to rest, and in due time rise with their load. Here are also horses, and very fleet, but small and ill shaped, used mostly by those *Arabs* who live upon spoil and robbery.

The *Arabs* in general are of a swarthy complexion, mean stature, raw-boned, and very swift of foot; their voices are effeminate as well as their temper; they have no settled habitations, except those that live on the sea-coasts, but rove from place to place, sleeping under tents, which they pitch at night, wherever their convenience or fancy leads them. *Ammianus Marcellinus*, a judicious Roman author, gives us the following character of them. "They are a people whom we are neither to wish for our friends nor our enemies; a martial people half naked, clad as far as the groin with painted caffocks, ranging up and down on camels and swift horses, as well in peace as in troublesome times. They are neither used to plough, plant, nor till the ground, but wander from place to place, without either house or home, or any constant habitation. They neither are governed by any laws, nor can brook any restraint. They cannot even endure to be long confined to the same soil and climate; their manner of living being always fleeting, like ravenous kites, who snatch up their prey in their flight, but never tarry if it requires any time to carry it off. Their food is commonly such venison and fowls as they catch, or milk, or such herbs as fall in their way, knowing nothing either of corn, or wine. Their wives they only hire for a time; who, though for a shew of matrimony, they present their husbands with a spear and tent, yet can easily part with them when they please. Both sexes are excessively addicted to lust; the women as roving as the men, married in one place, and brought-to-bed in another, leave their children where they fall, without any farther care of them." This character exactly tallies with their present, as may appear from the relations of those travellers who have had an occasion to visit this country, or the misfortune to fall into their hands. All are unanimous in representing them as a rude and rapacious crew, strolling about in droves, constantly watching after their prey, catching at all that comes within their reach, fly and silent, falling upon you before you are aware, and fleeing before you can think of pursuing; sparing neither life nor any thing that falls in their way, but plundering whole countries and caravans, and murdering all that make head to resist.

The Turks, however, who have subdued the greater part of them, exert frequently their utmost to keep them in awe. But though *Arabia* is reckoned under their government, it may notwithstanding be more properly said to be under their protection than dependence. The cherif of Mecca, reputed a descendant of Mohammed, is still possessed of very large dominions; and a number of other *Arabian* princes hold themselves independant. Those in *Arabia Felix* are indeed kept under some restraint by the Turkish galleys on the Red-Sea, but the rest are left to range on the mountainous parts; some in the deserts of Lybia and Thebais, others in the frontiers of Idumæa, Syria, and Palestine. These the Turkish bathaws do what they can to suppress, and often cut off such as fall into their hands. But multitudes still subsist there, by retiring into the mountains and deserts, where no army can come at them. Some nearer Syria are a

little more orderly, and seek a livelihood by the making of pot-ash; they are Mohammedans, of the sect of Abul-mazar. The rest, more out of reach, being supplied out of Persia with powder and fire-arms, are the most formidable and mischievous to the Turks. Those on the borders of Egypt are the poorest and most miserable, except some few to whom the Turks give lands, to defend the frontiers against the rest. The grand signior keeps generally 30,000 men in pay to defend the pilgrims that go to Mecca and Medina, and the caravans against the *Arabs*; and for the same purpose, makes very considerable presents to the cherif of Mecca, the greatest of all the *Arabian* independant princes: but notwithstanding all these precautions, they boldly assail the caravans, and it is not long since they cut off one of no less than 7000 pilgrims, who were on their return from performing their devotions at the tombs of their prophets.

Though the far greater number of the *Arabs* are in effect guilty of the immoral practices attributed to them, yet many of them shew the reverse in their conduct of life; especially such as live in towns, and apply themselves to trade and commerce, to arts and sciences, in which they generally excel. This is more particularly true with respect to the ancient *Arabs*, whose extraordinary performances in physics, astronomy, and mathematics, shew them to have been of great genius and application. They are even to this day allowed to be very ingenious, subtle, witty, generous, and great admirers of poetry and eloquence; though, on the other hand, reckoned very superstitious and vindictive. And, as to their living upon plunder, those that reckon themselves the immediate descendants of *Ishmael*, are so far from disowning, or being ashamed of it, that they repute themselves the only nation intitled to that way of living; because *Abraham*, the father of their progenitor, is recorded to have sent him away without any portion, from which they infer that he left him the whole world to range in at pleasure. We must not, however, forget that the figures we use in arithmetic are not only allowed to have been invented by them, but do actually retain their ancient form; and, if we may believe the Portuguese, who traded with them, several of their princes have fine libraries, with many Greek and Latin authors complete, of which we have only fragments.

The barrenness of the adjacent parts of *Arabia* to the neighbouring countries, may be a natural reason why it was never conquered; otherwise the spices, balm, gums, and other valuable products of *Arabia Felix*, which they are all sufficiently acquainted with, must undoubtedly have tempted some of them to have made a conquest of it. Mohammed, by broaching his new religion, laid the foundation for a new monarchy among the *Arabs*, who before had stood under their own government, divided into many kingdoms, states, and tribes; and since this memorable epoch, his religion found so many admirers, that it spread itself over the greatest part of Asia and Africa, and even over some considerable provinces of Europe; for they were his disciples who conquered and founded the four great monarchies or empires of Turkey, Persia, Morocco, and Fez, and the great Mogul, to say nothing of the several countries they hold in India, in all which Mohammedanism is universally professed.

ARABIA Deserta, the first division of *Arabia*, now called *Berri Arabistan*, and *Beriara*, is bounded according to modern geographers, on the east by Diarbec and the Persian territory of Hierack; on the west by Palestine, and *Arabia Petraea*; on the north by the river Euphrates and part of Syria; and on the south by *Arabia Felix*, from which it is divided by a long chain of mountains. This country was anciently the abode of the *Israelites*, after their passage of the Red Sea, during forty years; and was properly enough called by *Moses*, the *Wilderness of Desert*; for such it is in reality, for the greater part, being intersected almost every where by high barren mountains, and many of its plains being nothing but great sands and heaths, through which travellers must not only carry provisions, but steer by the stars and mariner's compass. *Guiland Melchior*, who had gone through some of them, tells us, that there are neither men, beasts, birds, or trees, grafs or pasture to be seen, nor any thing

but vast rolling sands and craggy mountains. The lands, however, that lie to the east along the river Euphrates, afford both plants and food for the inhabitants of some cities and towns seated on that part; and there are some plains and vallies that feed great numbers of sheep, goats, and other cattle, which love to browse upon such dry lands; but larger cattle, except camels, can find here no subsistence.

The method of the inhabitants of the *Desert*, is to seek after fresh pastures near rivers, lakes, or other places where they can find water for themselves and cattle; and when they have cleared that ground to look out for another. They are often forced to shift their places sooner than they otherwise would, because their living upon plunder makes them afraid of being surprized in their abode, if they should tarry too long in it. They entertain so high an opinion of their descent, that they think it beneath them to follow any mechanic employment, or even to cultivate the land; so that their whole exercise is getting on horseback, and feeding of flocks. They acknowledge no other government than that of their own *emirs* or princes; and seldom, if ever, have any commerce, much less alliance, with the Turks and Moors, whom they look upon as bastards, and the usurpers of their inheritance. Their *emirs* have each of them a certain number of *cheikhs* under them, according to the extent of their dominions. The word *cheikh* signifies an *elder*, and is equally applied to governors and men of learning; but the former are lords over a certain number of families, out of which they choose the soldiery they require, both for their plundering expeditions, and to guard their respective camps. In other cases they value themselves much for their fidelity and hospitality to strangers, and especially to those who put themselves under their protection.

The *Arabs*, in general, use no other weapons but the spear, sword, and iron club, and sometimes a hatchet. As for muskets, pistols, much less cannon, they never use them in their warlike, or rather pilfering expeditions, except those on the frontiers of Persia, who are sometimes supplied with small fire-arms to annoy the Turks. The Turks themselves never let them have any, it being death for any of the sultan's subjects to furnish them with any kind of arms or ammunition. The *Arabs* of the *Desert* are so little used to gunpowder, that the very noise and smoke of it throw them into a panic; but they are very expert marksmen with their darts and spears, and are generally well-mounted, and their horses are very swift. It is commonly with the best of these horses that their *emirs* present the Porte, which is all the tribute they pay to it.

Some of these *Arabs*, by the name of *Bedsui*, have spread themselves as far as Egypt, roving from place to place with their wives, children, and cattle. The children go quite naked; the women wear only a blue kind of long shift, and the men a coarse linen jacket reaching down to their knees. They all profess the Mohammedan religion; but give themselves little trouble about the disputed meanings of the Alcoran. They keep the feasts and fasts of the Turkish law with great exactness, and use the same washings and hours of prayer. On the circumcision of a child, which is not performed till old enough to remember what is done to him, they make great rejoicings, and commonly sacrifice an ox or a few sheep, the flesh of which they distribute to the poorer sort. They are reported to be very civil and humane to Christians, whom they suffer to live amongst them with all freedom, insomuch, that to see their hospitable manner of living in these communities, and to meet them in the high-way in their excursions, one would not believe them to be the same people.

They have neither laws, lawyers, nor judges amongst them; the *cheikhs* reconcile all their differences, and the *emir* is the only person to whom they appeal from their sentence. They affect an extraordinary gravity in their discourse and behaviour, and look upon the beard to be such a distinguishing gift of providence, that no greater punishment can be inflicted upon them than cutting it off. Wives shew their respect to their husbands, children to their parents, and friends to each other, by often kissing their beards. They commonly are more

careful for the genealogies of their horses than for their own, especially those of an extraordinary breed. The dropping of every colt, extraction, colour, marks, are all attested by a witness, and registered by the *cheikh*, or man of letters, of which a faithful copy is produced and authenticated when the creature comes to be sold. Some of them bear a price from 1000 to 2000 crowns.

Arabia Deserta is divided into three principalities.

1. *Anna*, whose chief cities are, Anna, on the Euphrates, the capital; Mescheid-Urfin, Sumifcabac, Thema, Anna on the Aftan, Balsora, and Tangia.

2. *Argia*, whose chief towns are Argia, the capital, Tarea, Maaden, Thaalabah, Aladi Dhath-Aliantaba.

3. *Chavabeda*, whose chief towns are, Chavabeda, Tangia, Merah, Megiarah. The principalities of Argia and Chavabeda are in all respects unknown to us, except in the *Arabian tables*; and of the first principality, only *Anna* and *Balsora* are of any note.

Anna was formerly a famed mart-town, but now not much frequented. It stands in latitude 33 deg. 57 min. east longitude, 42 deg. 10 min. on the river Euphrates, in a fruitful and pleasant soil, and has but two streets, which are divided by the river. That on the Mesopotamian side is about two miles long, but thinly peopled, and by none but tradesmen; that on the opposite side is about six miles in length, and it is there that the principal inhabitants of the city dwell. Every house has some ground belonging to it, and these grounds are loaded with noble fruit-trees, as lemons, oranges, citrons, quinces, figs, dates, pomegranates, olives, all very large, and in great plenty. Some of the flat grounds are sown with corn and other grain, which yield likewise a considerable crop. This city is the common rendezvous of all the robbers that infest the country, and from which they disperse themselves into all parts of the *Desert*. Here they meet to consult; here they hold their grand council, and deliberate where to rob next with success. It is with great difficulty that the Turkish aga, and the janissaries, who are kept here, can levy tribute imposed by the Turks on all the commodities carried through this city; which is one of the great thorough-fares for the passing of the caravans that go to and from Aleppo, Tripoli, Damascus, Bagdad, and some other parts of the Turkish empire.

Balsora, or *Bassora*, is situate in latitude 30 deg. 17 min. east longitude, 49 deg. 10 min. on the confluence of the Euphrates and Tigris into the Persian gulph. It was once famed for a market-place, still standing, to which all the *Arabian* merchants for a good way about used to resort, as to an exchange, which made trade to flourish. The prince of *Balsora* gives full liberty to all nations to come and trade to his capital, where they are so civilly used, and such good order kept, that one may go safe through the streets at all hours of the night. He is tributary to the Turk, and has his chief revenue from the exchange of money, for the horses and camels sold there; but chiefly from his palm-trees, of which he has a plantation reaching almost ninety miles in length, and none dare touch a date till they have paid him a certain custom. The horses which are bred here are in request, and sell at a vast price. The income of the prince from these articles of money, horses, camels, and dates, is so great, that he is able to lay up a very considerable sum every year, all the other charges of his tribute and government defrayed.

Balsora has been under the Turks ever since the year 1668, and like all other cities, tributary to that dominion, is governed by a *cadi*, appointed by the prince. Ships from all the maritime parts of Asia and Europe resort to it. The English and Dutch have their factories here, which are very considerable, and maintained by their East-India company to carry on their commerce with China, Japan, and other parts of India, and for dispatch of their letters from all parts into England and Holland, by way of Damascus and Aleppo, which are carried by *Arabs* for that purpose, who are very swift of foot. What still encreases the opulence of *Balsora* is, that the Persians, in their caravans or pilgrimages to Mecca, take this city in their way, and not only pay considerable duties to the government, but exchange many rich commodities. The baseness of the coin hav-

ing a greater alloy than that of other nations, and being exchanged by the merchants at a great disadvantage, is one great abuse here, which is yet winked at both by the Porte and prince, because it brings in a considerable profit.

This city, though pretty large, has nothing extraordinary in its buildings, either public or private, being built after the Turkish manner. The whole country about it lies so low, that if it was not for a stout dyke or bank, which extends all along the coast, it would be in danger of being laid under water. This bank is between three and four miles long, and built of large square stones, so well cemented together, that the water cannot affect it, though the sea runs strong, it being the very end of the Persian gulph.

ARABIA *Petræa*, the second division of *Arabia*, is the most western of all the three *Arabias*, and is now called *Das-lik Arabistan* by the Turks, and *Barraab Arabistan* by the natives, and by others *Bathalabah*; but most commonly the beglebergate of *Bofra*, so named from that capital. It is bounded on the north by Syria and Palestine; on the east by *Arabia Deserta* and part of *Arabia Felix*, which likewise bounds it on the south; and on the west by the Red-Sea and the isthmus of Suez or Egypt. Its extent from north to south is computed to be 180 miles, and from east to west 150. It includes part of ancient Idumea on the north, and some extend it a good way into the territory of Mecca on the south. The northern part, abounding with barren mountains, is thinly inhabited, and is under the Turks in the beglebergate of Cairo; but the southern is both fertile and well-peopled, and governed by its own princes, except some places along the coast. It is called *Petræa*, or *Stony*, from its rocks, though some rather derive it from *Petra*, its ancient capital, now commonly supposed to be *Horach*, or *Horac*, lying on the isthmus near the frontiers of Egypt. Though in most respects it much resembles *Arabia Deserta* for its stony, sandy, and barren grounds, yet it yields in some parts sufficient nourishment for cattle, whose milk, and camels flesh, is the chief food of its inhabitants. There are some other parts which are quite uninhabited and impassible.

The chief places of *Arabia Petræa* are *Bofra*, *Tabuc*, *Acra*, *Horac*, *Sur*, *Madian*, *Rephaim*, *Kadesh Barneah*, the mountains *Horeb* and *Sinai*, the wilderness of *Pihahiroth*, *Elim*, and some others mentioned in Scripture.

Bofra, the capital, seated in the midland, on the back of Palestine, on the other side Jordan, and about 150 miles from the lake, or sea of Galilee, has neither buildings nor any thing worth mentioning in it. *Horac*, built near or upon the ruins of the ancient *Petra*, is now but a small place; but formerly was a very strong fortress, situate on a rock. It made a long and stout resistance against the Romans, and was for its impregnable strength, used by the foldans of Egypt for the repository of all their riches. All the other just-mentioned places are of no consideration, except *Sur*, now called *El Torre* and *Tor*, which has a good harbour, with some trade, and about 400 houses, inhabited by some Christian merchants, Jews, and Moors. Goods are here unladen to be carried by land to Suez, on the isthmus, 120 miles north-west at the end of the west gulph, which is not navigable for large vessels any farther than this town, by reason of the rocks. Near *Tor* is the garden which Moses is said to call *Elim*. It is planted with palm-trees, and some Greek monks, who have a monastery here, make some tolerable profit of the dates, which are the best in the country. Near the castle of *Tor* the Israelites are generally supposed to have crossed the Red-Sea. In the way from *Tor* to mount *Sinai*, the vallies abound with Cassia-trees, which produce the frankincense; and among other trees that grow on these mountains, there is a sort which bears a kind of wool like cotton, though neither so fine nor white.

The desert of *Sinai* exceeds all the rest of the country in height, and is encompassed with hills and high rocks for ten or twelve miles. However, the road or ascent to it is easy, having been cut into the solid rock, like stairs, quite to the top, by order of the empress *Helena*; but most passengers choose to go it on foot, being uneasy to the camels. It is called by the *Arabs* *Gibel Mouja*, or *Moses's*

Mountain; and at the foot of the ascent is a well-built convent. The monks pretend to shew the very place where Moses fasted forty days, and received the two tables of stone. Towards the north side of the plain lie the mountains *Horeb* and *Sinai*; the latter is the higher, and is called *St. Catherine*. Both are very steep and high, but not proportionably broad, and though a road is all the way cut up to them, yet the ascent is very difficult.

At the foot of *Mount Horeb* is a Greek monastery, called *St. Saviour's*, where pilgrims lodge. It stands at the end of a large green plain, where it is said Moses kept Jethro's flocks, and saw the burning bush. The building is large, but irregular, and consists of several courts; but the church is a noble edifice of fine workmanship, both within and without. The pavement is of marble, curiously laid in form of roses, and the ornaments, plate, altars, and other utensils, are very rich and exquisitely fine. The monastery is well supplied with water from a spring that descends from *Mount Horeb*. On the top of the mountain, and all about, there is a considerable number of cells and chapels, the former abode of many monks and hermits; but they are now mostly empty, the religious people having been driven away by the *Arabs*; and the steps, of which there were 14,000, that now lead to the mount, are in many places broken and shattered, though in others still very good and of easy ascent. On *Mount Horeb* is likewise shewn the very place where the Israelites worshipped the golden calf.

At a considerable distance on the same plain, and near another monastery, called the convent of the forty martyrs, stands the rock which Moses smote with his rod, and brought forth from it a miraculous supply of water. It has a great many holes at which the water flowed out on both sides. There are no other rocks nor stones near it. The tops of those mountains command a noble prospect to the Red-Sea, and all the adjacent country. Several other places are here shewn, which are not so easily credited by those who are acquainted with the Scriptures; as the place where *Corah*, *Dathan*, &c. were swallowed up; the stone on which the brazen serpent was erected; the hillocks where the idolaters were buried by Moses's order; the two hollow stones in which Aaron cast the golden calf, &c. for *Corah* and his rebellious crew perished near *Mount Hormah*, and not in *Horeb*; the brazen serpent was set up at *Mount Hor*, and the rock out of which Moses fetched the water, is said to have been in the wilderness of *Zin*, all of them far enough from *Sinai* and *Horeb*. To these might be added the city of *Midian* or *Madian*, where Jethro, Moses's father-in-law, dwelt, and where he staid with him forty years; *Rephidim*, the place where the Amalekites fell foul upon the rear of Israel at their first coming out of Egypt; *Kadesh Barneah*, the station of the Israelites, whence Moses sent the spies to examine the promised land, and several others, all in this province; but whose true situation it is impossible to know with any tolerable certainty. As for the mountains of *Sinai* and *Horeb*, they stand in latitude 28 deg. and 29 min. and east longitude 34 deg. on the southern verge of this province, near the northern coasts of the Red-Sea.

ARABIA *Felix*, the third division of *Arabia*, by far the largest and most considerable of the three *Arabias*, is called by the inhabitants *Yeman*, *Yaman*, and *Hyaman*, from one of the largest districts in it, which has given name to all the rest. It has had the title of *Felix*, or *Happy*, from its extraordinary fertility, and constant verdure; but was anciently called *Saba*, *Sabea*, and *Seba*, by the sacred writers, by Josephus, and St. Jerom, from *Seba* the son of *Cush*, the grandson of *Ham*, who was properly the founder of a city of the same name, anciently celebrated for its opulence, and more particularly for its plenty of gold and silver. This *Arabia* is situate on the south of *Petræa* and *Deserta*, and surrounded on all the other three sides by the sea, as by the Red-Sea on the west, the gulph of Persia and *Ormuz* on the east, and the ocean, or Arabian sea, on the South. The ancients were not content to give it the title of *Happy*, but added that of *Sacred* to it, on account of its fine aromatic gums and fragrant woods, which were used in sacrifices, such as frankincense, myrrh, aloes, nard, cinnamon, cassia, cedar, and other

other odoriferous woods, which are in such plenty that the natives use them for common fuel. And, indeed, if we were to judge of this *Arabia* by what the ancients have launched out in its praise, we should imagine it the richest and most delightful land in the whole world. It was reckoned the most populous province in all Asia, and was in such esteem among the Romans, even so late as *Ammianus Marcellinus's* time, that he gives this delicious character of, or rather panegyric upon it. "The *Happy Arabians* are so called, because abounding in corn, cattle, vines, and odoriferous spices of all kinds. They are well furnished with roads and quiet harbours for fishing, with trading towns standing very thick. Besides most wholesome springs of medicinal waters, they enjoy the benefit of many brooks and rivers very clear and pure, and a temperature of air exceeding healthful." If we were to judge of this character by the last part of it, what this author says must go for nothing; for the air and climate cannot be different from what they were in his time; and how he can extol the temperature of a country which lies two parts in three within the tropics, cannot be well conceived. What he says of trading towns and commodious havens might indeed be true then, but is since quite altered. The Red-Sea was very much frequented by merchant-ships, before the Cape of Good Hope, and the passage by it to the Indies, was found out; and *Arabia* was the market where all the commodities brought from India, China, and all the eastern islands, were sold to the merchants of Egypt and Barbary, and brought by them over land to Cairo and other ports in the Mediterranean, whither the English, Italians, and other European nations, came to take them off their hands: but now the goods from India and Persia are brought to us directly by sea, the commodities of *Arabia* are become less useful, and our commerce with it consequently is considerably decreased. However, if the accounts of the ancients concerning this *Arabia* were really true, and not taken upon trust, they sufficiently shew how surprisingly it must have been altered since they wrote; for at this time, nothing like that so much exaggerated fecundity, much less that great number of cities and inhabitants appears, except in some few spots here and there, which bear but a very small proportion with the rest; the midland being either sandy or mountainous, and consequently all dry and barren: so that the sea-coasts and the lands along the banks of rivers, are the only places that deserve the name of *fertile* or *happy*. But it may well enough deserve those titles by its fine spices and odoriferous plants, more especially for its frankincense, which is peculiar to it. To this we may add the coffee-trees, but which are found only in three or four districts of the province of *Yemen*, properly so called, and grow in the mountainous part of it. It likewise produces abundance of other exquisite fruits, is watered with fine springs, refreshed with agreeable breezes, and enjoys a constant verdure all the year round; but even in this noble province some parts of it are almost as barren as the *Petraea*, or *Deserta*, and produce nothing for thirty or forty miles together, especially where it runs contiguous to the Red-Sea.

Arabia Felix is commodiously divided into the following maritime and inland districts.

On the sea-coasts are, 1. The kingdom or principality of *Mecca*, whose chief towns are *Mecca*, *Medina*, *Egra* or *Hagiar*, *Giedda*, *Yambo*, and *Zebith*. 2. The maritime *Tebamah* al *Dhafar*, in which are the cities *Dhafar*, *Tazu*, *Adiud*, and *Traza*. 3. The principality of *Zebith*, *Zebeth*, *Zaba* or *Saba*, with the towns of *Zebeth*, *Gilan*, and *Chalafea*. 4. The kingdom of *Mocha*, or *Aden*, with the towns of *Mocha*, *Aden*, and *Laghi*. 5. The kingdom of *Xael*, or *Hadrarnut*, in which are the towns of *Xael* and *Dolfar*. 6. The kingdom of *Seger* or *Alibani*, and *Guehelhamen*. 7. The principality of *Yemen*, with the towns of *Calhat* at *Quelhat*, and *Mafcate*. 8. *Vodane*, with the towns of *Soher* and *Boricen*. 9. *Mascat*, with the city of its name, *Nuban*, and *Suchula*. 10. *Barbaim*, with the towns of *Elcatif*, *Labfah* or *Laffack*, *Abfa*, and *Bisfa*.

In the inland are the principalities or kingdoms of, 1. *Jemaman*, with the capital of its name, *Chadoia*, and *Tima*. 2. *Higiaz* or *Hagiaz*, with the towns of *Casailo*,

Bain, *Nabel*, *Carn*, and *Almanfel*. 3. *Thabama*, with the towns of *Zaana* and *Saada*. 4. *Fartach*, with the capital of its name, *Marhi*, and *Negram*. 5. *Oman*, with the towns of *Ziriffdin*, and *Marair*. To these we may add *Ormus*, formerly a considerable *Arabian* kingdom, which though denominated so only from a small rocky island of a few miles extent, yet had some large territories on the *terra firma*; but the Persians having conquered them in 1622, the kingdom was wholly destroyed, and the island is now become quite inconsiderable. The English assisted the Persians in the reduction of *Ormus*, and dispossessed the Portuguese, who held it for near one hundred years, and grew so wealthy in it, that they had built them most magnificent houses, inasmuch that the city of *Ormus* was esteemed in their time one of the finest in Asia.

The most celebrated places of *Arabia Felix*, are *Mecca* and *Medina*, and particularly on account of the pilgrimages of the Mohammedans to them. A caravan goes every year from *Damascus*, or *Aleppo*, to the tomb of Mohammed, and generally sets forward in July, about which time shoals of pilgrims arrive from Persia, the Mogul's territories, Tartary, and from all other countries, where Mohammedanism is professed.

Some days before the caravan sets out, the pilgrims make a general procession, called the procession of Mohammed, in order, as they say, to obtain a happy journey, through the prophet's intercession. Those most distinguished by birth or riches appear in the finest habits, mounted on horses sumptuously caparisoned, and followed by slaves, with led horses, and camels covered with costly ornaments. The pilgrims, called the issue of the race of Mohammed, begin the march, clothed in long robes, with green bonnets on their heads: they walk four in a rank, and are followed by several musicians, after whom come the camels, with two kettle-drums in their front, and many trumpets, the noise of which inspires these creatures with a kind of fierce air. Next to these come on horseback the other pilgrims, six in rank, followed by carriages full of children, whom their parents intend to present to the prophet. These are surrounded with crowds of singers, who at the same time use a thousand extravagant gestures. Then succeed two hundred cavaliers, clothed in bears skins. They have the management of small pieces of cannon, mounted on their carriages, which they discharge every hour. These cannon are escorted by another company, who wear tigers skins, in the form of cuirasses. Their long moustaches, Tartar bonnets, and huge scymitars, give them a very warlike appearance. Before the mufti walk four hundred men, clothed in green, with yellow mitres on their heads. He himself is accompanied by the doctors of the law, and a number of singers. Mohammed's standard is carried immediately behind him, made of green satin, embroidered with gold. It is guarded by twelve horsemen, in coats of mail, with silver maces in their hands, accompanied with trumpets, and men who strike continually in concert on plates of silver. Next follows the pavilion to be presented before the tomb of Mohammed, borne by three camels adorned with green feathers and plates of silver. It is of crimson velvet, embroidered with gold, and set with jewels of all colours. Lastly, the *basha* of Jerusalem, preceded by drums, trumpets, and other instruments, brings up the rear.

The procession being ended, every pilgrim thinks of nothing but his departure for *Mecca*, to which indeed all Mohammedans are under a strict obligation to make a pilgrimage, either in person or by proxy, once at least in their life. In their progress they pray frequently every day, always with their faces turned to that city, on which they bestow the epithets of *magnificent*, the *mother of cities*, and the *house of God*.

Mecca is situate in latitude 21 deg. 58 min. east longitude 40 deg. 30 min. about forty-two miles east from the Red-Sea, on the river *Eda*; but in such a barren territory, that it affords no kind of sustenance, either to man or beast. The greatest supply the inhabitants have of necessaries, is from the pilgrims and caravans they come with. No Christian is allowed to come nearer it than five miles, and the punishment for so doing, is to be burnt alive. They are also extremely careful concern-

ing those they let into it, for fear of having the place surprized or prophaned, or the treasure rifled, which is said to amount to an immense value. The grand mosque is in the middle of the city, and is the largest, finest built, and best frequented of any in the world. Its roof, high and bold, rises in a stately cupola, with two lofty towers at the end, all which are seen a great way off, and yield a noble prospect, being also finely carved, and the cupola covered with gold. It is said to have a hundred gates, with as many windows, one over each gate; but the ground of the building being low, there is a descent to it by ten or twelve steps. They pretend it is situated on the very spot on which Abraham built his first dwelling-house, and where Mohammed was born. This house of Abraham, which they call *Kiaba*, or small square house, is fifteen feet long, twelve broad, and about thirty high. It is girt round with two belts of gold, one near the bottom and the other near the top; the door is of silver, and a golden spout carries off the water which lies on the roof; and the walls are constantly covered with hangings of fine silk and rich workmanship, and the court that incloses it, is surrounded with stately walls, beautified with columns and arches. The house itself is reckoned a place of the greatest devotion, and is never opened but on their feast called *Ramadan*, and some other solemn festivals. Near the door is a black stone of the bigness of a man's head, which is pretended to have been brought from heaven by an angel to Abraham, and to have turned black for the sins of mankind: the first man that can kiss it on a certain day is esteemed a saint, but commonly pays dear for his faintship, the people crowding so fast about him to kiss his feet, that he is often stifled by the throng. In the same inclosure is a kind of chapel, built about a well much celebrated throughout the East. They say that the water of that well flows from a spring which God discovered to Agar and Ishmael, when being expelled by Abraham his house, they were forced to retire into *Arabia*. Mohammed availed himself of this well to render the city of his nativity respected by all his followers. He declared, that the water had the virtue, not only of curing all bodily diseases, but also of purifying souls stained with the blackest crimes.

The pilgrims that come hither are obliged to perform many ridiculous ceremonies; the chief of which are, to strip themselves naked at a place called *Rabbak*, two days before they enter the city, having only a napkin tied about their necks, and another about their middle: in this state of nudity they continue eight days, during which, they neither shave, buy, sell, or kill any thing, nor are allowed to speak harshly to their servants or slaves, on pain of giving some money to the poor, or sheep for sacrifice. When they are admitted into the city, they go seven times round the temple; the three first times with a very quick pace, to shew their readiness to fight for the true worship, as they fancy, of God. They accompany their prayers with antic postures, in imitation of a priest that goes before them, and is their chief posture-master. They next sacrifice some sheep, the greatest part of whose flesh is given to the poor, and then go to the valley of *Mina*, where they shave and pair their nails. From thence they go to *Mount Arafat*, a short day's journey from *Mina*, every man carrying forty-two stones to throw at the *devil's head*, who, they say, tempted Abraham there, when he was going to sacrifice his son, not Isaac, but Ishmael. On the tenth day, the most solemn of all, the priests preach to them from this mount, after which they go down into the valley, where they sacrifice a prodigious number of sheep, mostly given to the poor. On the twelfth day, the *che-riff* having sent them his blessing, they are at liberty to depart.

The concourse of pilgrims on these festivals to this city is such, some making their number amount commonly to 200,000, that the wealth of it encreases daily. The temple being entered only four times a year, the people from all parts have sufficient notice of it, and time to join the caravans. They commonly offer some considerable presents, and buy up some of the reliques of the place at a dear rate. Those reliques are for the most part the old coverings of the *Kiaba*, which are yearly presented to it by the grand signior on the feast of *Beyram*,

or Turkish Easter: at which time the old ones are taken off, and being cut into small pieces, are either made presents of, or sold to the pilgrims. People of quality may, for the sum of an hundred shequins, have the doors of the holy place opened to them at any time, which they choose to do, to avoid the vast crowds that flock thither on the four seasons. Besides this religious traffic, a great fair is kept during the solemnity, in which the richest merchandizes are exposed to sale. The vaults of the mosques, and the shops round them, are filled with prodigious quantities of most sorts of commodities, particularly with precious stones, and scented and other aromatic powders; even the caves in the adjacent mountains are turned into shops.

This is but a sketch of the transactions of this superstitious pilgrimage, in which *Thevenot* assures us upwards of six thousand of one single caravan have died by hot winds, and other difficulties, between Cairo and Mecca, when he was there. He adds, that the effects of all that die fall to the *hamirag*, who is the person they choose for their leader; so that these poor people are cheated out of their lives and substance, to enrich the priests and officers who conduct them.

It is a vulgar error, that Mohammed was the original author of those pilgrimages to this city. The *Arabs*, from time immemorial, used to frequent it in the same manner; and, out of veneration for this place, which they held to have been the house of their progenitor, made it the center of their religion. According to the doctrine of the Mohammedans, Adam being yet in Paradise, which they place in one of the heavens above us, worshipped God in a temple raised by the angels; but, upon his expulsion, having prayed to God to grant him such another upon earth, he obtained a model of it, drawn upon some curtains of light, and the building was placed just where the *kiaba*, or holy house, now stands, that is, perpendicularly under that which the angels resorted to in heaven. Here the faithful paid their worship till the flood; but it being then destroyed by the waters, Abraham was at length directed by God to build another, which became the place of worship for Ishmael and his descendants, till having quite polluted it by their idolatry, Mohammed was ordered to purify it, by consecrating it anew to the worship of the true God. All which fables, together with its being given out to be the very house in which himself was born, being once swallowed down by the Mussulmen, that impostor concluded rightly, it would not fail of bringing as great, if not a greater concourse of devotees to Mecca, than it had lost by the abolition of its idols.

Between the cities of Mecca and Medina, there is an extensive sandy desert, where the dry sands blown up and down by the winds often overwhelm whole caravans. To prevent this as much as possible, they are not only obliged to observe how the wind blows, to encamp on the opposite side, but likewise to steer by the mariner's compass, as at sea. The length of the caravan's journey from Mecca to Medina is about 224 miles, which are performed in about forty days.

Medina is situate in latitude 25 deg. east longitude 39 deg. 12 min. seventy-six miles from the Red-Sea, in a plain, watered with the river Larick, and covered with stately palm-trees. Mohammed's repentment against his fellow-citizens of Mecca, who were for banishing him from the place of his nativity, inspired him with a resolution of being revenged upon them. He declared, that Medina should be his city, and the seat of empire for him and his successors; whence, by way of excellency, it is so called by the *Arabs*, *Medina* signifying a city in general; and it is sometimes stiled *Medina al Nabi*, or, the city of the prophet. Mohammed also ordered, that his sepulchre should be built here; and accordingly, his coffin rests in the great mosque, a structure of vast magnificence, supported by four hundred stately columns, and illuminated by three hundred fine lamps, which hang on them, and are kept continually burning. It has a small cupola covered with plates of silver, and the floor covered with cloth of gold. It stands almost in the center of the city, and is the most resorted to in the whole world, except that of Mecca. Mohammed's coffin lies under the cupola, and the tomb is exposed to view from the middle

to the top of the dome, round about which is a little wall pierced with windows, which are fenced with silver grates. The inside is enriched with stones of immense value, of great size and beauty, especially on that part of the cupola which is over the head of the prophet, and where there is a diamond, one inch thick, and two long, presented by sultan Osman, the son of Achmet. At the feet of the coffin is a rich golden crescent, so curiously wrought, and adorned with such precious stones, that it is esteemed a master-piece, and of very great value. The coffin is kept covered under a rich pall of gold and silver tissue, and under a canopy of the same precious cloth, both which are annually sent hither by the basha of Egypt, by order of the grand signior, and with the greatest magnificence. It is commonly carried upon and displayed over the back of some stately camel, in company with the rest of the caravan; and when the precious gift is taken off, the beast is no longer to be used in servile drudgery. When laid upon the coffin, the old one is cut into innumerable threads, and either fold or given away, as one of the most valuable presents. The place where the coffin lies, is supported by black marble pillars, and encompassed with a balustrade of silver, hung with such a number of burning lamps, that the smoke darkens the place. The cupola, which is hung with red and white damask, has the epitome of the Mussulman faith embroidered on it in golden Arabic characters, *God is God, and Mohammed is his prophet*. The crowd of pilgrims is so great at the time of their resorting to this mosque, that they can only see the outside of the dome, and some of the treasures that glitter within through the silver grates, as the large diamond and crescent, which are indeed the most valuable curiosities of all; but those who make any long abode in the city, may take a convenient time when there is no crowd, and for a certain sum see every particular of the inside at leisure. All true Mussulmen are bound by their religion to visit this tomb at least once in their life; and after performing that ceremony, they are looked upon as saints ever after. The rich and great, whose ambition lies another way, are dispensed with for a considerable sum, and by sending some other person in their stead. Christians of all denominations are forbid to come within fifteen miles of this city, under pain of being burnt alive, as at Mecca.

As soon as the caravan, which brings the presents from the grand signior, arrives, the dervises, who have the care of the mosque, appear to receive it. Then the pilgrims, in conjunction with those that came in other caravans, make the whole edifice resound with their shouts of joy, and songs in honour of their prophet; after which, there is nothing but feasting and open rejoicing, till the departure of the caravans.

The day of departing, the pilgrims assemble again, and set out, singing some verses of the Alcoran with a loud voice. Every one thinks it an honour to supply them with provisions for the whole journey, and they are sure upon their return to meet the congratulations of all the towns from whence they set out. They are honoured every where, and from that time they begin to enter into the possession of all the privileges which their religion grants to those who go to visit the prophet's tomb. Their pilgrimage screens them from all pursuits on former delinquencies, and, if criminals, renders them perfectly guiltless. The camels also, as above hinted, which have had the honour to bear the presents to Mecca and Medina, are not to be treated afterwards like common animals; they are considered as consecrated to Mohammed, which exempts them from all labour and service. They have cottages built for their abodes, where they live at ease, and are well fed and taken care of.

The most powerful Mohammedan princes pay the deepest veneration to the *cheriffs* of Mecca and Medina, considering them as of the race and successors of Mohammed: they also frequently send them offerings and valuable presents; and, among his other pompous titles, the grand signior in particular styles himself the servant of the two sacred towns of Mecca and Medina.

ARABICUM GUMMI, *gum arabic*, is a concrete gummy juice, which drops from the tree that yields the *true acacia*. It is of a bright, pale yellow, or yellow colour, brittle, without any smell or taste, some-

what wrinkled on the outside, and shining within like glass. It grows soft in the mouth, sticks to the teeth, and readily dissolves in water, but not in spirit of wine, or in oils. In the fire it burns to a coal, but does not flame. The best sort of this gum is dry, transparent, of a white or pale yellow colour, and free from dirt. The true *gum arabic* is rarely to be met with in the shops: *gum senega*, which is brought from the coasts of Guinea, is usually sold for it. This greatly resembles the other; and probably, as *Dale* conjectures, exudes from a tree of the same kind: it is generally in large pieces, rough on the outside, and in these circumstances possibly consists the only difference between the two; although the former is held to be the purer and finer gum, and therefore chose for medicine; and the latter the strongest, most substantial, and cheapest, and consequently more employed in certain trades and businesses.

The *gum* heats and moistens, inspissates, stops the pores of the skin, and blunts the acrimony of medicines. From its soft, glutinous quality, it is serviceable against coughs, hoarseness, and disorders of the *aspera arteria*; is a good ingredient in applications to the eyes and arteries, and is of great efficacy in the *dysuria*, or heat of urine, and the *diabetes*.

ARAC. See ARRAC.

ARACAN. This kingdom, with that of *Pegu*, which follow that of *Bengal*, and whereof the latter's coast joins those of *Malacca*, are better known in India by the piratical courses of the one, and the lasting wars of the other with the king of *Siam* for the famous white elephant, than for the largeness of their commerce with the Europeans: the English and Dutch, however, preserve some correspondence with *Aracan*, on account of the refreshments which their ships are sometimes obliged to take there, yet without having any settlements, although the king has often invited those two nations to an establishment in his country.

In respect to the kingdom of *Pegu*, the Dutch send some ships here yearly from their settlements on the coast of Coromandel and Bengal, laden with linens of this last kingdom, from Masulipatnam and Meliapour, better known under the name of St. Thomas. The proper linens for this commerce are Lagias, or Alegias, Topites, and Corpi Pintadi; the Peguans preferring the linens of Meliapour to all others, and it is with these that they clothe themselves, without the tailor's assistance, each piece making a complete habit, in turning it many times, and in many manners, about their body; the women cut them in four, and cover themselves to their knees. There is also brought thence opium, pepper, cinnamon, nutmegs, sanders, and wood of Paradise.

The exports from hence are ginger, gold, silver, precious stones, and pearls, which two last are contraband; and there must be a permission from the king, for either buying or selling. This kingdom also produces a quantity of rice, and it is from hence that the Dutch carry it to Malacca; besides which, the exports are elephants teeth, pewter, honey, wax, cardamoms, long pepper, cashew, &c.

ARACI, a fine town seated on the Aar in *Switzerland*, has some manufactures of worsted, fatins, and camblets, knit stockings, cotton handkerchiefs, cutlery ware, and horn combs. Hides and skins are also prepared here for various uses; and its neighbourhood furnishes a quantity of hempen and cotton-cloth.

ARAINS, striped or checked armorines or taffeties, which come from the Indies.

ARANEA, a silver ore found only in the mines of Potosi, or in the single mine there of Catamito. It owes its name to some resemblance it bears to a *cobweb* (a spider being called *aranea* in Latin) being composed of threads of pure silver, which to the sight appear like a silver lace, when burned to separate the silk from it. It is the richest of all kinds of silver ore.

ARARES, a name given by the Indians to that kind of fruit, which is called, in Europe, *citrine mirobolans*. This sort of mirobolans is thought proper to purge the gall.

ARATE, a weight in Portugal. See AROBE.

ARBITRAMENT and ARBITRATION, is the sentence or determination, pronounced by *arbitrators*, and published

ished when they have heard all parties. And this is either general of all actions, demands, quarrels, &c. or special, of some certain matters in controversy; it may be also absolute or conditional.

To every *arbitrament*, five things are incident, viz. First, *matter of controversy*. Secondly, *submission*. Thirdly, *parties to the submission*. Fourthly, *arbitrators*. And, fifthly, *giving up the arbitrament*.

Arbitrators cannot refer *arbitraments* to others, if the submission be not so; but an *arbitrament* that one shall re-lease to another, by advice of a certain person, this is good, because it is a reference only for the execution of it.

Submission to *arbitraments* are usually by bond, and the parties who bind themselves, are obliged to take notice of the *award*, at their peril; but things relating to a freehold, debts due on bond, or on certain contract, criminal offences, &c. are not *arbitrable*.

For ending suits by *arbitrament*, the following act is the only one made in any late reign, viz.

After the 11th of May, 1698, all merchants, and traders, and others, desiring to end any controversy, suit, or quarrel, (for which there is no other remedy, but by personal action or suit in equity) by *arbitrament*, may agree, that their submission of the suit to the *award*, or *umpirage* of any person or persons, shall be made a rule of any of his majesty's courts of record, which the parties shall choose, and may insert such their agreement in their submission, or the condition of the bond of promise; and upon producing an affidavit of such agreement, and upon reading and filing such affidavit in the court so chosen, the same may be entered of record in such court, and a rule of court shall be thereupon made that the parties shall submit to, and finally be concluded by such *arbitration* or *umpirage*: and in case of disobedience thereto, the party neglecting or refusing, shall be subject to all the penalties of contemning a rule of court, and process shall issue accordingly, which shall not be stopped or delayed by any order, &c. of any other court, either of law or of equity, unless it appear on oath, that the *arbitrators* or *umpires* misbehaved themselves, and that such *award* was corruptly or unduly procured.

Any *arbitration* or *umpirage*, procured by corruption or undue means, shall be void, and set aside by any court of law or equity, so as such corruption or undue practice be complained of, in the court where the rule is made for such *arbitration*, before the last day of the next term, after such *arbitration* made and published to the parties.

Form of an arbitration bond.

Know all men by these presents, that I A. B. of the parish, &c. in the county, &c. merchant, am field and firmly obliged to C. D. of &c. in the county aforesaid, £sq; in pounds, of good and lawful money of Great-Britain, to be paid to the said C. D. or his certain attorney, his executors, administrators, or assigns, to which payment, well and truly to be made, I oblige myself, my heirs, executors, and administrators, firmly by these presents, sealed with my seal, dated at on the day of in the sixth year of the reign of our sovereign lord king George III. and in the year of our Lord God, one thousand seven hundred and sixty-six.

The condition of this obligation is such, that if the above bound A. B. his heirs, executors, and administrators, for his and their parts and behalfs, do in all things well and truly stand to, obey, abide by, perform, fulfil, and keep the award, order, arbitrament, final end and determination of E. F. and G. H. arbitrators, indifferently named, elected, and chosen, as well on the part and behalf of the above bounden A. B. as of the above-named C. D. to arbitrate, award, order, judge, and determine of, and concerning all, and all manner of action and actions, cause and causes of actions, suits, bills, bonds, specialties, judgments, executions, extents, quarrels, controversies, trespasses, damages, and demand whatsoever, at any time or times, heretofore had, made, moved, brought, commenced, sued, prosecuted, done, suffered, committed, or depending, by or between the said parties, so as the said award be made, and given up in writing, under their hands and seals, ready to be delivered to the said parties, on or before the next ensuing the date above-mentioned: but if the said arbitrators do not make such their award of, and concerning the premises, by the

time aforesaid, that then if the said A. B. his heirs, executors, and administrators, for his and their part and behalf, do in all things well, and truly stand to, obey, abide by, perform, fulfil, and keep the award, order, arbitrament, umpirage, final end, and determination of J. K. umpire, indifferently chosen between the said parties, of, and concerning the premises, and deliver the same in writing, under his hand and seal, to the said parties, on or before the next ensuing the date aforesaid, then this obligation to be void, or otherwise to be, and remain in full force and virtue.

Signed, sealed, and delivered

in the presence of

L. M.

N. O.

A. B.

Note. If there is no umpire, the latter part must be omitted, viz. from, "but if the said arbitrators, &c." Though it is now customary to choose three arbitrators, and have them nominated in the bonds.

The aforesaid bond must be mutual between the parties, and the following clause may be added at the end of the condition, as the agreement mentioned in the preceding act of parliament, viz.

And the above-mentioned A. B. doth agree and desire, that this his submission to the award above-mentioned, be made a rule of his majesty's court of King's-Bench, (or any other court of record) pursuant to the act of parliament for this purpose provided, and the like for the other party submitting to such award. See ARBITRATOR and AWARD.

ARBITRATION, in exchanges, has been variously defined by the several authors who have treated of it.

One says it is a combination or conjunction made of many exchanges, to find out what place is the most advantageous to remit or draw on.

Another describes it, by saying it is only the foresight of a considerable advantage, which a merchant shall receive from a remiss or draught, made on one place preferably to another.

A third construes it to be a truck which two bankers mutually make of their bills upon different parts, at a conditional price and course of exchange.

According to a fourth, it is the negotiation of a sum in exchanges, once or oftener repeated, on which a person does not determine, till after having examined by several rules which method will turn best to account.

And though these several distinctions are couched in different terms, they seem (if rightly considered) to have the same meaning, whereof some may be counted the text on which the others serve as comments or expositions.

Arbitrations are divided by the writers on them into *simple* and *compound*, of which we shall succinctly give some examples, and endeavour, as plainly as we can, to illustrate such rules for their operation as may render them easy, both to the operation and performance; our predecessors having consigned us this task by their unanimously leaving the solution of their questions too much in the dark to be comprehended by most of their readers, contenting themselves with replying to the queries, without shewing their method of performing, and thereby rendering abortive their pretended design of conveying instruction; which could no otherwise be done than by a delivery of their ideas and conceptions in such a manner as might leave them open, and easy to be followed and practised.

A *simple* (or *single*) *arbitration*, is to be wrought by the direct, or inverted rule of three; and to distinguish which of these rules is to be used in working any question relative thereto, it must be observed:

1. That an *arbitration* must be cyphered by the direct rule of three, when the first term of the stating is more than the third, and that the quotient is less than the middle term. And,

2. This rule must be used when the first term is less than the third, and the quotient is more than the middle one.

And the two following remarks will shew when the indirect, or inverted rule, is to be followed.

1st. The question must be worked by the inverted rule of three, when the first term is less than the third, and the quotient less than the middle number.

2d. The

21. The operation must be by this rule, when the first term is more than the third, and the quotient more than the middle term.

And whether the *arbitrations* be simple or compound, a price of exchange must always be supposed, when a reimbursement is ordered on any other place than that from whence it is directed.

Whatever number of figures enter in a compound *arbitration* question, the first and last must be of the same species, and the rules must be commenced by the species sought for.

These maxims being well understood, and applied to the examples, will facilitate the operation of the rules of *arbitration* to those who pay any attention to them.

And as the use of some characters instead of words will considerably abbreviate the work in the solution of the subsequent examples, we have employed them to this purpose, and shall here explain them.

× signifies multiplied by, as 10×54 , is 10 multiplied by 54.

A number above a line, with another under it, signifies that the uppermost must be divided by that beneath, or the numerator by the denominator, from whence

$\frac{24 \times 67 \times 19}{15 \times 28 \times 12}$ signifies, that 24 multiplied by 67, multiplied by 19, must be divided by 15 multiplied by 28,

multiplied by 12; and $\frac{54}{234\frac{1}{2}}$ denotes, that 54 is to be divided by 234, increased by $\frac{1}{2}$.

= signifies, equal to, as $10 = 5 \times 2 = 8 \times \frac{5}{4}$.

This premised, we proceed to our proposed

First EXAMPLE.

A of Lyons orders B of Cadiz to draw upon him at 76 fols *per* dollar, provided at the same time he can remit him on London, at 42 d. sterling also *per* dollar, but as B drew at $75\frac{1}{2}$, it is demanded at what exchange he may remit on London to compleat this order; and this is answered by the direct rule of three as follows:

If 76 fols give 42 d. sterl. what shall $75\frac{1}{2}$ fols give?

$$\begin{array}{r} 42 \\ 150 \\ 300 \\ 21 \\ \hline 76)3171(41\frac{7}{8}\text{d. sterl. anf.} \\ 304 \\ \hline 131 \\ 76 \\ \hline 55 \end{array}$$

Second EXAMPLE.

A of Oporto had orders to draw on Rouen, at 490 rees *per* crown of 60 fols, provided he could at the same time remit on Leghorn at 770 rees *per* dollar; but as on receipt of the said order he could get no more for his bill than 488 rees, it is demanded at what price he ought to remit on Leghorn, to recompence the said diminution in his draughts; which is solved by the inverted rule of three, in the following manner,

If 488 rees — 770 — 490

$$\begin{array}{r} 770 \\ 34160 \\ 3416 \\ \hline 490)375760(766\frac{2}{3}\text{ or } \frac{6}{7}, \text{ the answer.} \\ 343 \\ \hline 327 \\ 294 \\ \hline 336 \\ 294 \\ \hline 42 \end{array}$$

Third EXAMPLE.

To be answered by the double rule of three.

A of Amsterdam orders his friend of Madrid to remit him upon Lyons, at 64 fols Tournois for a new dollar of 340 maravadis, and to draw upon him at 100 d. de gros *per* ducat of 375 maravadis. It is demanded at what price the exchange turns out to him between Amsterdam and Lyons.

The common way of working it.

$$\begin{array}{r} 64 \text{ fols} \text{ ————— } 340 \text{ marav.} \\ 375 \text{ marav.} \text{ ————— } 100 \text{ d.} \text{ ————— } 60 \text{ s.} \\ \hline 320 \qquad \qquad \qquad 34000 \\ 448 \qquad \qquad \qquad 60 \\ 192 \qquad \qquad \qquad \hline 2040000 \\ 24000 \text{ Divisor.} \end{array}$$

$$\text{Dividend, therefore } \frac{2040000}{24000} = \frac{2040}{24} = 85 \text{ groots.}$$

And the most compendious method by abridging the numbers we shall thus shew.

If $\left. \begin{array}{l} 64 \\ 375 \end{array} \right\}$ are equal to $\left\{ \begin{array}{l} 340 \text{ mar.} \\ 100 \text{ groots} \end{array} \right\}$ | $\left. \begin{array}{l} 16 \text{ fols} \\ 15 \text{ mar.} \end{array} \right\}$ must be equal to $\left\{ \begin{array}{l} 85 \text{ maravadis,} \\ 4 \text{ groots, then} \end{array} \right\}$
Quere, 60 fols as before. But to reduce the work lower still, it appears that you may divide a member on each side of the last equation by 4, and another on each side also by 5, therefore you will have 4 fols 17 mar.

3 mar. 1 groot, where 4 multiplied by 3 is in the same *ratio*, or proportion, to 17 × by 1 or 17, as 64×375 is to 340×100 . But as the answer was found by multiplying 60 into the last *ratio*

(or $\frac{340 \times 100}{64 \times 375}$) so it may be likewise had by multiplying the 60 into the foregoing *ratio*, viz. $\frac{17}{2}$, whence we

have the work brought into this small compass $\frac{60 \times 17}{12}$, which may yet be more contracted, as 60 and 12 are commensurable by 6, and will become $\frac{10 \times 17}{2} = 85$, the

same as before. This well observed, fully explains the method for contracting the most extensive compound *arbitrations*, as well as these simple ones. The manner of stating the compound ones we shall give in another place.

Fourth EXAMPLE.

B of Amsterdam gives an order to E at Cadiz, to remit on Hamburg at 124 gros lubs for 1 ducat of 375 maravadis, and to draw for him at 126 groots de gros for the said ducat. It is demanded at what price the exchange will be between Amsterdam and Hamburg? Answer at $32\frac{1}{4}$ stivers *per* daalder of 32 s. lubs.

$$\begin{array}{r} 31 \\ \text{For } 124 \text{ gros lubs} = 1 \text{ ducat.} \\ 1 \text{ ducat} = 126 \text{ groots of Amsterdam} \text{ — } 375 \text{ s. lubs.} \\ 8 \\ \hline 31(1008(32\frac{1}{4} \text{ answer.} \\ 93 \\ \hline 78 \\ 62 \\ \hline 16 \end{array}$$

The four preceding examples may suffice to shew the different methods of working by the direct, inverted, and double rule of three; but those that follow being more complex, and their operations more difficult to be reduced into as small a cyphering as what has been just now done, and the common practice shews, we have borrowed the assistance of the following tables from Mr. Samuel Ricard, as he did the principles of them from another, of which he himself gives the subsequent account.

TABLE II.

TABLE IV.

Amsterdam, Antwerp, Paris, &c.

Amsterdam and Antwerp. | *Antwerp and Paris.*
Amsterdam and Paris. | Number fixed 6489.

If you take for Paris, London, Cadiz, or Venice, this makes no alteration, and the fixed number shall be the same.

Amsterdam, Venice, and Lyons.

Amsterdam and Venice. | *Amsterdam and Lyons.*
Venice and Lyons. | Number fixed 6489.

Amsterdam, Paris, and Hamburg.

FIRST CASE.

From Amsterdam on Hamburg and Paris.
 From Hamburg on Paris and Amsterdam.
 From Paris on Amsterdam and Hamburg.

Amsterdam and Hamburg. | *Amsterdam and Paris.*
Hamburg and Paris. | Number fixed 1470.

This may serve likewise for Amsterdam, Hamburg, and Venice; but you must take half of the deniers lubs, which are given at Hamburg for a ducat, and instead of Paris, you must read from Venice.

SECOND CASE.

From Amsterdam on Paris and Hamburg.
 From Hamburg on Amsterdam and Paris.
 From Paris on Hamburg and Amsterdam.

Amsterdam and Paris. | *Amsterdam and Hamburg.*
 $\frac{1}{2}$ *Paris and Hamburg.* | Number fixed 8250.

Amsterdam, London, Paris, &c.

Amsterdam and London. | Number fixed 291.
 London and { Paris, Venice, Genoa, Leghorn. } and Amsterdam.

Amsterdam, London, and Spain.

Amsterdam and London. | *Amsterdam and Spain.*
London and Spain. | Number fixed 1104.

Amsterdam, London, and Lisbon.

Amsterdam and London. | *Amsterdam and Lisbon.*
London and Lisbon. | Number fixed 4270.

Amsterdam, Genoa, and Venice.

Amsterdam and Genoa. | *Venice and Amsterdam.*
Genoa and Venice. | Number fixed 6454.

Amsterdam, Dantzick, and Hamburg.

Amsterdam and $\frac{1}{2}$ Dantzick. | *Dantzick and Hamburg.*
Amsterdam and Hamburg. | Number fixed 2510.

Amsterdam, Lisbon, and Lyons.

Amsterdam and Lisbon. | *Lyons and Amsterdam.*
 $\frac{1}{2}$ *Lisbon and Lyons.* | Number fixed 6489.

But if the change from Lisbon on Lyons exceed 567 reis, take $\frac{1}{8}$ instead of $\frac{1}{2}$, and the fixed number will be 3479.

Amsterdam, Paris, and Spain.

Amsterdam and Paris. | *Spain and Amsterdam.*
 $\frac{1}{4}$ *from Paris and Spain.* | Number fixed 2876.

That is, whatever French livres are given or received for a pistole of Spain, must be reduced into fols, and the quarter part taken.

There might be chosen many other places, but to be short, we have taken no more than two particular cafes, which we have in the seventh and eighth propositions.

Berlin, Amsterdam, Genoa, Turin, Geneva, Frankfort, and London.

Berlin and Amsterdam. | *Turin and Genoa.*
Amsterdam and Genoa. | *Geneva and Frankfort.*
Turin and Geneva. | *London and 10 times Berlin.*
Frankfort and London. | Fixed number 8193.
 Provision.

11	506	511	516	521	526	531	535	540	545

An Explanation of the Table.

N^o II. is for London. N^o III. is for Hamburgh, if the exchange is found in the eighths and sixteenths. N^o I. is for all other places; and for Hamburgh when the exchange is in shillings, $\frac{1}{2}$ shillings, and $\frac{1}{4}$ shillings. N^o IV. serves to shew the numbers that must be added together, viz. all those that must be added together on the same side.

The fifth and sixth are for profit and loss. If it is found that the sum of the addition of the side in which to find that given is less than the other sum of the side where what is received is, it must be sought for in the table of profit, N^o V. and when there is a loss, in that of N^o VI. And that the use which may be made of these tables may the easier be comprehended, we shall here add some examples.

First EXAMPLE.

A of Amsterdam remits on London to B at 34 s. $5\frac{1}{2}$ groots, what B remits for the account of A to Cadiz at $49\frac{3}{4}$ d. sterling per dollar. If the merchant at Cadiz remits the produce on Amsterdam at $121\frac{1}{2}$ groots of Holland per ducat of 375 maravadis; it is demanded how much A hath gained or lost, exclusive of the charges.

Solution by the Tables.

He gives	He receives
34 s. $5\frac{1}{2}$ grs. 2654	$121\frac{1}{2}$ 7335
49 $\frac{3}{4}$ d. 3457	7215
Fixed number 1104	
	120
7215	

$2\frac{1}{2}$ per cent. gained.

A R B

The Operation.

d.	Maravadis.	d.
If $49\frac{3}{4}$ Mar.	272	240 will give $1312\frac{3}{4}$ mar.
If 375	$121\frac{1}{2}$ grs.	$1312\frac{3}{4}$
	2	199
	243	11810
		11811
	2	1312
		261120

199

Now the 2d and 3d terms multiplied, and divided by the first in the order they now stand, will be expressed as follows;

$$\frac{243 \times 261120}{2 \times 199 \times 375}, \text{ which gives 425 groots.}$$

Now the difference between 34 s. 5 grs. $\frac{1}{2}$ and 425 grs. is $11\frac{1}{2}$ grs. therefore $\frac{11\frac{1}{2} \text{ grs.}}{34 \text{ s. } 5\frac{1}{2} \text{ grs.}} \times 100 = \frac{23}{827} \times 100 = 2\frac{8}{10}$ nearly.

By the double rule of three.

d.	Mar.	d.	grts.	Mar.
$49\frac{3}{4}$	375	240	$121\frac{1}{2}$	272
4			2	
199			243	

You may express the last three terms divided by the first two, thus, $\frac{240 \times 243 \times 272 \times 4}{199 \times 375 \times 2} = 425$, as before.

Second EXAMPLE.

A of Amsterdam remits to B of Dantzick, at 276 grofs of Poland, for one livre of grofs, the which B remits on Hamburgh at $115\frac{1}{2}$ grofs for 48 shillings lubs; if Hamburgh remits what it amounts to, to A at $33\frac{3}{8}$ stivers per daalder of two marks lubs; it is demanded how much per cent. A has gained or lost, omitting the charges.

Solution by the Tables.

A gives	N ^o fixed	A receives
$115\frac{1}{2}$ 7115	2510	$\frac{1}{2}$ 276 is 138 7888
	9625	$33\frac{3}{8}$ 1699
	9587	9587

38 or $\frac{9}{10}$ per cent.

By the rule of three.

grofs.	shil. lubs.	grofs.
If $115\frac{1}{2}$	48	276 will give $114\frac{5}{7}$, then
shil. lubs.	stiv. of Amster.	shil. lubs.
If 32	$33\frac{3}{8}$	$114\frac{5}{7}$

This ordered according to the foregoing example, will produce $118\frac{9}{10}$ stivers, which taken from the 120 stivers first given, there remains $1\frac{1}{10}$ stivers, therefore

$$\text{as } 120 \text{ --- } 1\frac{1}{10} \text{ --- } 100 \text{ to } \frac{1}{10}, \text{ the loss per cent.}$$

By the double rule of three.

grofs.	s.l.	grofs.	stiv. of Amst.	s.l.
$115\frac{1}{2}$	32	276	$33\frac{3}{8}$	48
The fractional terms being reduced into improper fractions, as these in the first example, the operation then will be entirely similar to the last in the said example, and $118\frac{9}{10}$ stivers, as before.				

Third EXAMPLE.

Two persons, A and B at Paris, have occasion for money at Cadiz; A remits directly, and gives 18 livres 3 sols per Spanish pistole; B chofes the way of Holland, and orders to be remitted him from Amsterdam at $121\frac{1}{4}$ groots for a ducat of 375 maravadis; Amsterdam reckons

$\frac{1}{2}$ per

$\frac{1}{2}$ per cent. charges, and draws for his reimbursement at the rate of $56\frac{1}{4}$ groots per French crown of 60 sols; it is demanded which of the two methods proved must advantageous?

Answer; his who remitted directly.

Operation by the Tables.

A gave $56\frac{1}{4}$ 3990 B gave $121\frac{1}{4}$ grts. 7326
 $\frac{1}{4}$ of 36 sols is $9\frac{3}{4}$ 6067 $\frac{1}{2}$ per cent. 22
 Fixed number 2876
 10057

10224
 10057

Seek in Number VI. 167

$3\frac{1}{3}$ per cent.

OTHERWISE.

By reflecting on the nature of the question, it appears, that what Amsterdam reckons for charges may be considered to encrease the number of sols so much more than B would otherwise have paid for the 375 maravadis; therefore first say, if $100\frac{1}{2}$ — $\frac{1}{2}$ — 60, or if $10\frac{1}{2}$ — $\frac{1}{2}$ — 6, or if $5\frac{1}{2}$ — $\frac{1}{2}$ — 3 must give $\frac{3}{10}$, which B must pay at Amsterdam for his charges for every 60 sols in the value of the 375 maravadis. But instead of finding the sols B must pay, excluding the charges, and then computing the charges, and adding them to the sols last found for B's whole payment, you may by parity of reason say,

groots. sols. groots.
 As $56\frac{1}{4}$ — $60\frac{3}{4}$ — $121\frac{1}{4}$ to $129\frac{3}{4}$ sols paid by B for a ducat. Lastly, to compare whether A or B has succeeded best, say,

l. s. the maravadis in a pistole. sols.
 If 18 — 3 — 1088 — $129\frac{3}{4}$ will give 389 maravadis, which B would have had got instead of 375, had he exchanged as A did; therefore it is manifest, that in receiving only 375, he had less than A for the same sum of Paris money by 14 maravadis; and to make a calculation per cent. it will be

mar. mar.
 As 375 — to 14 — 100 to $3\frac{1}{3}$, the answer.

Fourth EXAMPLE.

A merchant of Hamburgh orders us to draw for his account on Dantzick, at 270 grofs of Poland for 1 livre de grofs, and to remit the amount on London at 35 schillings per pound sterling, or at other rates, which may be more advantageous for him, provided he can draw on Dantzick at 261 grofs of Poland; it is demanded at how much he ought to remit to follow the last order. Answer, at 36 schillings $2\frac{1}{2}$ groots.

Solution by the Tables.

Take the half of the grofs of Poland according to the order, and the exchange will be 135 and $130\frac{1}{2}$.

Order { 135 7793
 35 schil. 2721

10514
 $130\frac{1}{2}$ 7645

2869 this must be sought for in the table for London; and the schillings and groots of grofs which correspond to this number, will be found to be 36 schillings $2\frac{1}{2}$ groots.

By the rule of three.

In this question it is obvious, that as the grofs of Poland given for a livre de grofs decrease, the schillings given for a pound sterling must proportionably encrease, to follow the condition of the last order; hence the question is an inverted one in the rule of three, and thus stated:

grofs of Poland. schillings. grofs of Poland.
 If 270 ————— 35 261, where
 $\frac{270 \times 35}{261}$ gives 36 schillings, and the remainder multi-
 16.

plied by 12 for groots, and the next by 2, for half groots, at each time dividing by 261, brings out $2\frac{1}{2}$ groots nearly.

Fifth EXAMPLE.

There is an order to A of Amsterdam to draw on Paris at $53\frac{3}{4}$ groots per crown, and remit on London at 34 schillings 1 groot per pound sterling, or at other prices which might be as profitable to him who gave the order. If they can draw at $56\frac{1}{4}$ and remit at 34 schillings $7\frac{1}{2}$ groots; it is demanded whether he can comply with this commission, how much this differs per cent? Answer, Our correspondent receives more than he first ordered about 3 per cent.

Solution by the Tables.

	s.	groots.	
34 schilling 1 groot	2606	34	$7\frac{1}{2}$ 2675
$56\frac{1}{4}$ pence	3990	53	$\frac{1}{4}$ 3793

A receives by the exchange 6196 and by the order 6468
 6468

128 seek in the table of profit, and you will find about 3 per cent.

By the rule of three.

groots.	s.	groot.	groots. fch.	groots.
As $53\frac{3}{4}$ — 34	1 —	$56\frac{1}{4}$ to 35	8 the	

rate at which A might remit per pound sterling to London, when he drew on Paris at $56\frac{1}{4}$ groots per French crown; but he only remitted at 34 s. $7\frac{1}{2}$ grs. therefore in remitting this last sum he gained 1 schil. $\frac{1}{2}$ grt. the difference between 35 schil. 8 grs. and 34 schil. $7\frac{1}{2}$ grs. and to find what that comes to per cent. say,

fch.	grts.	grts.	grts.
If 34	$7\frac{1}{2}$	$12\frac{1}{2}$	100 will bring out the answer.

Sixth EXAMPLE.

There is an order to draw on Frankfort 100 rixdollars current money of Amsterdam for $128\frac{1}{2}$ rixdollars of Frankfort, and to remit on London at 35 schillings bank money per pound sterling, on condition that the agio shall be 5 per cent. If after this our correspondent writes to us, to omit executing this order, if not already done, unless he receive 2 per cent. more from London than he had ordered: if they can only draw on Frankfort at 135 rixdollars that money for 100 rixdollars of Amsterdam, it is demanded at how many schillings the remits must be made to follow the last order? Answer, 34 schillings $4\frac{1}{2}$ groots.

Solution by the Tables.

$128\frac{1}{2}$ 7586	135 7793
5 per C. 212	2 per C. 86
35 fch. 2721	
	7879

10519
 7879

2640. This number seek in the table for London, and you will find 34 schillings $4\frac{1}{2}$ groots correspond thereto.

For a different solution, it is easy to conceive that when the agio is high the less Frankfort money is given for current money of Amsterdam (the exchange being by banco money) consequently the less banco money must be remitted to London per pound sterling; whence it is clear, that the way to get 2 per cent. from London by remitting at the same rate as before, you must consider the agio as so much less; therefore instead of 95, we have 97 rixdollars banco money of Amsterdam for $128\frac{1}{2}$ rixdollars of Frankfort, at which rate I find the bank money of Amsterdam equal to 135 rixdollars of Frankfort; thus,

rixd. of Frank.	rixd. banco of Amsterd.	rix. Frank.
-----------------	-------------------------	-------------

If $128\frac{1}{2}$	97	135 will
---------------------	----	----------

give $101\frac{1}{2}$ But by the question there are only 100; therefore the remits on London must be made accordingly less, by saying,

A R B

Seventh EXAMPLE.

Solution by the Tables.

there will be found $60\frac{1}{10}$, and it shall be your answer, 4286. This sought in Tab. I.

OTHERWISE.

how much = 1 pound sterling at *London*.

But

A R B

A R B

But to know how many rixdollars must be remitted *per* pound sterling to T, so that he may gain 3 *per cent.* say by the rule of three direct,

If 100	$5\frac{6}{10}$	103
103		$5\frac{6}{10}$
65		
515		515
618		66 $\frac{2}{3}$
100	66195	100
		8195

Eighth Example.

C of Genoa remits for his own account to D of Venice, a certain sum at 104 Marchetti for 4 livres of Genoa, ordering him to remit the net produce to E at Florence; D effects it at 75 crowns d'or of Florence for 100 ducats of Venice. E takes bills on Leghorn at 119 fols 6 livres of Florence, which he remits to F who takes others on Novi, at 175 dollars for 100 crowns de marc of Novi, who remits them to G who in his turn remits them to H of Milan at 180 foldi imp. for a crown de Marc, who makes a remiss at Amsterdam to I of 52 fols of Milan (whereof 140 are worth 106 foldi imp.) for a guilder of Amsterdam, who finally takes bills on London at 34 sch. *per* pound sterling, which he remits to C himself, for whose account all these negotiations were made. If fix of the correspondents deduct each $\frac{1}{2}$ *per cent.* for charges, it is demanded at what price the exchange was between Genoa and London, if C finds that the money he has been in disburse for six months has brought him in an interest after the rate of 8 *per cent.* *per annum.* Answer, 55 $\frac{8}{10}$ d. sterling *per* dollar of 5 livres.

Solution by the Tables.

After having found the exchange, which is here between London and Genoa $58 \frac{13}{100}$ d. sterling for a dollar, it must be seen how much *per cent.* ought to be gained by the exchange, which the example tells us is 8 *per cent. per annum.* We see besides this, that C has been in disburse 6 months; for it ought to be worked by the direct rule of Three; and say,

If 12 months gain 8, how much shall 6 gain?

The answer will be 4, that is to say, 4 *per cent.*

Afterwards there is to be observed, what has been said before of the certain and uncertain price, and of the direct and indirect rule in our example. Genoa gives the price certain; then it must give to London 4 *per cent.* less than it has received; and consequently it must be wrought by the indirect rule of Three; and say,

If 100 — give $58 \frac{13}{100}$ d. — how much shall 104 give?

104) 5813 (Answer, $55 \frac{89}{100}$ d. sterling for a Genoa dollar.

Having solved the two preceding problems in the most concise method that we believe is possible, except by tables, we shall now demonstrate, in their explanation, how to perform (in the same manner) all questions relative to *Arbitrations.* And first, we shall deduce the rule for stating them from the second example of the double rule of Three preceding the tables, when the first term is fixed; the second, shewing what different money was given for it; the third, how much of the same specie as the second is given for the fourth, then what quantity of the specie of the fourth, for a fifth term given, which is of the same name as the first term. Now as all such questions, exceeding five given numbers, may, according to that excess, be called questions of the treble, quadruple, quintuple, &c. rule of Three, for whose stating we derive the rule from the foregoing, which will be exactly similar or agreeable to it; only we shall, for brevity's sake, call the first term, the first antecedent; the second term, the first consequent; the third term, the second antecedent; the fourth term, the second consequent, &c. and now express the rule.

The first antecedent must be a fixed exchange, and of the same denomination with the last consequent; the third antecedent of the same specie as the second consequent; and so on, always making the antecedents of the same name and specie as their preceding consequents, which you cannot but do if you follow the conditions of a given question; and if you have so done, you will find your last term of the same specie as the first, and then the demand or answer will be of the same name as the last consequent but one; if you find your work stand otherwise, most likely you have mistaken the first term. The question being thus prepared, it is plain, that the sum of the antecedents must be regarded as equal to the sum of their consequents, as each antecedent is supposed equal to its respective consequent, therefore their products must be accordingly so; for instance, if

5 = 2 more 3, and
 6 more 4 = 10, and
 7 more 5 = 8 more 4
 then 5 × by both 6 and 4, × by both 7 and 5 = 600
 = 10 × by both 2 and 3, × by both 8 and 4,
 but as one of the antecedents in every question is unknown, whilst all the consequents are otherwise, we have an unknown (though supposed) quantity multiplied by the known antecedents, = to the product of the consequents, therefore the unknown quantity (or answer) is found by dividing the product of the consequents (multiplied by one another) by that of the antecedents (multiplied in the same manner.) For example; suppose the case were, what unknown quantity × by 59 would be equal to 472; then I say, 472 divided by 59 gives the sought quantity, viz. 8. Now, in order to contract the work, it is plain, that it is the same thing whether you divide a product, which had divers multiplicators, or you divide one of the multiplicators, (which will admit it) by that number, and then multiply by the rest (for instance $\frac{2 \times 3 \times 12}{6} = 12 = \frac{12}{6} \times 2 \times 3$.) It is likewise evident, that if any two numbers be divided by the same number, their quotients will be in the same proportion as the numbers were. (Instance, 12 divided by 4 is 3, and 20 divided by 4 is 5; wherefore as 3 is to 5, so is 12 to 20; which was to be shewn.) Hence it follows, that, if when a question is stated, you can divide any antecedent and consequent (though they are not opposites) by the same number, the equality is still kept up; and thus you must continue so to do, till you can find no antecedent and consequent commensurable by the same number, then ordering this last equation as above directed, you will have the solution: and *note*, that the last consequent, to which the answer is sought, is subject to the division as the rest; for the product of the last, multiplied by the other consequents, is still the same, whether the last or any other is divided by the same number; this may be seen by the last instance but one, if you call 12 the last consequent; and from what has been said, I infer, that every antecedent after the first must be of the same denomination, as well as of the same species, as its preceding consequent; and that if any antecedent or consequent consists of different denominations, you must (to retain the equality) either reduce both them and their respective consequents and antecedents into the same denomination, or otherwise make the lower denomination an aliquot part or parts of the higher (as 3 l. 3 s. sterling would be $3 \frac{3}{4}$ l.) and then the others remain unaltered; and *note*, that in the second given examples, where the antecedents and consequents are scratched, they have been divided, and the quotients stand towards the left, separated from them by a point, thus, 4. $\frac{1}{2}$ s.; and what has been here said in regard to the questions of money, holds good also for those concerning weights and measures, which may be wrought exactly by the foregoing rules.

E X A M P L E.

If 100 lb. at London be equal to 106 lb. at Lyons, and 30 lb. at Lyons are worth 32 lb. at Paris, and 113 lb. at Paris make 90 lb. at Frankfort; and 12 lb. at Frankfort are given for 18 lb. at Venice, and 152 lb. at Venice are the value of 97 lb. at Cadiz; then how many lb. at Cadiz are equal to 60 lb. at London? Answer $51 \frac{7}{10}$

Being stated and contracted according to the preceding rules the work will stand thus:

$\frac{1}{2}$ s. lb. at London = 106 lb. at Lyons.
 5. 30 lb. at Lyons = 4. 32 lb. at Paris.
 113 lb. at Paris = 3. 90 lb. at Frankfort.
 1. $\frac{1}{2}$ s. at Frankfort = 3. 18 lb. at Venice.
 19. 152 lb. at Venice = 97 at Cadiz, then
 How many at Cadiz = 60 lb. at London.

If 100 ells at Amsterdam are equal to 120 ells at Hamburg, and 30 ells at Hamburg make $21\frac{1}{2}$ ells at St. Gall, and 86 ells at St. Gall are equal to 60 ells at Geneva, and 15 ells at Geneva are worth 28 ells at Dantzick; quere, how many ells at Dantzick are equal to 45 ells at Amsterdam? Answer 50 $\frac{1}{2}$

5. 100 ells at Amsterdam = 2. 4. 120 ells at Hamb.
 30 ells at Hamburg = $21\frac{1}{2}$ ells at St. Gall.
 43. 86 ells at St. Gall = 3. 60 ells at Geneva.
 15 ells at Geneva = 28 ells at Dantzick.
 How many ells at Dantzick = 3. 45 ells at Amsterdam.

With the preceding we finish this article of *Arbitration*, and have therein given an instance of every case that can happen in this curious branch of arithmetick; so that any addition would be superfluous, and unnecessarily encroach on our reader's time, without adding any thing to his instruction, which we believe he will find more truly promoted in this short tract, than he would by consulting the many volumes published on the subject; as he has here the reasons for all the operations proposed added to the solutions, which other authors have contented themselves with giving alone.

ARBITRATOR is an extraordinary private judge, between party and party, chosen by their mutual consents, to determine controversies between them. *West. Symb. sect. 21.*

And he is so called from *arbitrium*, (free-will) as some derive it; or because he has an *arbitrary* power, as is supposed by others; for if *arbitrators* observe the submission, and keep within due bounds, their sentences are definitive, from which there lies no appeal. *1 Roll. Abr. 251.*

The *award* of *arbitrators* is definitive, and being chosen by the parties, they are not tied to such formalities of law, as judges in other cases are, and yet they have as great power as other judges to determine the matters in variance; but their determination must be certain, and it is to be according to the express condition of the bond

by which the parties submit themselves to their judgment. *1 Nels. Abr. 234. Dyer 356.*

It has been a custom to chuse two, one by each of the contending parties, with a liberty for them to chuse an *umpire*, in case of disagreement; but as this method has, on many occasions, exposed the *arbitrators* to some disfigurements, from those whose differences they were labouring to reconcile, it has been a practice, for some time past, to nominate three in the bonds, by which means their different opinions remain secret, and consequently unknown to the concerned, who are too apt ungenerously to reflect on a determination, which will naturally differ from the opinion, at least, of one of the parties, and excite, in an uncandid manner, a censure, where, at least, their thanks are due.

The chancery will not give relief against the *award* of the *arbitrators*, except it be for corruption, &c. and where their *award* is not strictly binding by the rules of law, the court of equity can decree a performance. *Chanc. Rep. 279. 1 Vern. 24.*

When the *arbitrators* make an *award* upon one day, they cannot make another between the parties, on any other day; nor can they do it part at one time and part at another, although the times are within the submission. *26 Hen. VI. 52. 39 Hen. VI. 12.*

Though the *arbitrators* may agree upon a thing one day, and on another thing at another time, and at last make an *award* of the whole. *47 Edw. III. 21.*

Arbitrators are to *award* what is equal between the parties, and not on one side only, and the performance of it must be lawful and possible, also the *award* must be final. *2 Mod. Entr. Engl. 262. 1 Inst. 201. 1 Roll. Abr. 242.*

If the *arbitrators* make an *award* of money, to be paid to a stranger, &c. unless the parties have benefit by it, it will be void. *2 Saund. 122. 2 Lill. 169.*

And a party is not to be made a judge in his own cause by *award*. *1 Salk. 71.*

Where a thing is to be done on payment of money, a tender of the money is as much as an actual payment. *Mod. Caf. 33.*

Action of debt may be brought for money adjudged to be paid by *arbitrators*, declaring on the *award*; and also action of debt upon the bond; for not performing the *award*. *Brownl. 55.*

When there is but one *arbitrator*, which happens when the matter is referred to two, and they cannot agree, but leave it to be determined by a third person, it is called an *umpirage*. *8 Rep. 98.*

But the *arbitrators* are to refuse, and declare they will make no *award* before the *umpire* shall proceed, though an *umpire's award* shall be good, where the *arbitrators* make a void *award*, which is no *award*. *1 Lill. Abr. 170.*

It is said an *umpirage* cannot be made till the *arbitrator's* time is out; and if any other power be given to the *umpire*, it is not good; for two persons cannot have a several jurisdiction at one time. *1 Mod. Rep. 15.*

But this seems to be contradicted by the practice aforementioned, of nominating three *arbitrators* in the bond, except the distinction consists in bounds only, as neither of the three is termed an *umpire*.

An *arbitration* is generally an effect of moderation in the contending parties, who think it more safe to refer the matter in dispute to the determination of friends, than to venture a trial at law, more especially as the one is costly, and the other transacted gratis; and the civilians make a difference between *arbitrator* and *arbitrator*; an *arbitrator* being tied to proceed and judge according to law, mingled with equity; but an *arbitrator* is wholly at his own discretion, without solemnity of process, or course of judgment, to hear and determine the controversy referred to him, so as it be *juxta arbitrium boni viri*. *Cowel.*

Arbitrators should give their *award* without entering into particulars, or assigning their reasons for it, as this might expose them to a chancery suit from a dissatisfied party, and it should be in writing, and within the time limited by the *arbitration* bonds.

There should be appointed by the *award*, some reciprocal act, to be done by each party to the other, which the law requireth to be *quid pro quo*, although it be never so small; and reciprocal acquittances should be directed, either general or particular ones, according as the nature of the decision shall require. *Lex. Mer.*

The *arbitrators* are not to award any thing, whereby any matter, already determined by a decree in chancery, or a judgment at common law, or any sentence judicially given in the cause, be infringed or meddled with; for sentence of judicial courts of record are always of a higher nature than *arbitrators awards*, and justly challenge both obedience and respect; though civilians themselves do frequently call merchants in to their assistance, when the matter in dispute is relative to trade, and sometimes recommend the decision of a mercantile point to a trader, after they have long and curiously debated it, without bringing it to a conclusion. See **AWARD** and **UMPIRE**.

ARBOR, in botany, a tree. See the article **TREE**.

ARBOR, in mechanics, the principal part of a machine, which serves to sustain the rest; also a spindle or axis on which a machine turns.

ARBOR VITÆ, in botany, the tree of life.

This tree receives the name of *arbor vitæ*, or the *tree of life*, because it flourishes with a perpetual greenness, and breathes a fragrant and delicious odour. It never grows to any bigness with us in England, being a stranger, and only planted in gardens. The younger branches are flat-tish and tough, bearing on each side several winged leaves, which grow thick together, scaly, somewhat like cypresses, but smooth, and not prickly at the end, and very flat. It bears little small, scaly, white cones at the extremity of the branches. It came originally from Canada.

It is an opening and warming plant, provokes the menses, and is good against the chlorosis; bruised with honey, it dissolves tumours. The oil is commended against the gout, being rubbed on the part; for it acts like fire, by stimulating and opening. It cleanses beds from lice and fleas. *Boerhaave*.

ARBUTUS, the *Strawberry-Tree*. This genus of plants is ranged, by Dr. Tournefort, in his twentieth class, intitled, 'Trees and Shrubs with a monopetalous flower, whose pointal becomes a soft fruit, filled with hard seeds.' Mr. Ray places it among 'the trees bearing berries, including several seeds;' and Dr. Linnæus ranges it in his tenth class of plants; intitled 'Decandria Monogynia;' the flower having ten stamina, and one germen. These trees grow naturally upon the hills; in Italy and Spain, as also in the western part of Ireland. They rise to the height of twenty of thirty feet, but do rarely life with an upright stem, usually dividing into many stems near the ground, which put out, on every side, branches, which are garnished with oblong sawed leaves, of a bright green, and are stiff. These abide all the winter, and are thrust off in the spring by the new ones; so that it is always clothed with leaves. The flowers appear in September and October; soon after which time, the fruit, which succeeded the flowers of the former year, are ripe; for they are at least a year from the flowering to the ripening of the fruit. *Miller*.

ARCANUM, a remedy, whose manner of preparation is industriously concealed, in order to enhance its value. The word is Latin, and literally signifies a *secret*.

At present there are three remarkable remedies, which pass under the specious name of *arcana*, viz. *arcanum corallinum*; *arcanum duplex*, *sive duplicatum*; and *arcanum joviale*; but they are rarely used in the present practice of physic. The method of preparing these medicines may be seen in Quincy's Dispensatory.

ARCHANGEL. The English, in 1553, seeking a passage through the north and east seas to the East-Indies, discovered the port of Archangel in the White Sea. In this desert, there was only a convent, with the little church of St. Michael the Archangel. From this port, having ascended the river Duina, they arrived in the midst of the country, and at last at the city of Moscow. They easily made themselves masters of the commerce of Russia, which, from the city of Novogorod, where it was carried on by land, was transferred to this sea-port. It is, indeed, inaccessible seven months of the year; however, it was of much greater utility than the fairs of the great Novogorod, which sensibly decayed by the wars against Sweden.

The English obtained the privilege of trading there, without paying any duty, and it is so all nations ought, perhaps, to trade together. The English factory in Rus-

sia was first established in *Archangel*, in virtue of a charter granted by king Philip and queen Mary, at the same time that the czar Ivan Wafflowitz swayed the Russian scepter.

This charter is of too extensive a nature, either in regard to the crown, the Russia company, or the British subjects at large, to be fully complied with, and is consequently become in certain respects obsolete: it reserves however in full force such necessary authority as excludes all foreigners, except Russians, from a participation of the Russia trade to Great Britain; and, in virtue of the by-laws to which the traders acquiesce, the good government of the company is supported; a small tax is levied for extraordinary occasions, and for the charitable purpose of relieving poor seamen, and the widows of deceased mariners. This exclusive privilege of trade to Russia still continued in the reign of queen Elizabeth; but the factors employed in the name of the Russia company removed from *Archangel* to St. Peterburgh, soon after Peter the Great founded that city, which he made the seat of the Russian commerce. Peter the Great always shewed a distinguished regard to the English merchants, and even at the time that the politics of the two nations did not entirely coincide, he gave them his royal word, that at all events they might consider themselves as under his peculiar care and protection.

The trade of *Archangel* comprehends that which may be transacted in a part of Russia, and even as far as Moscow, by means of the Duina, on which this city is built, or other rivers with which this vast empire abounds. Besides the English and Dutch, who alone carry on more trade here than all other nations put together, the French, Swedes, Danes, Hamburgers, and those of Bremen, have their magazines and correspondents at *Archangel*. The commodities for this place are silk and woollen stuffs, linnens, castors, (from Canada) paper, mercery, hardware; cannons, and other arms, powder, brimstone, copper, lead, pewter, brandy, wine, oil, vinegar, sweetmeats, dried fruit, saffron, sugar, spice, pepper, herrings, incense, copperas, white lead, indigo; woods for dyeing the Russia hides; laces, gold and silver wire, and of this latter metal in specie. To which may be added Bourdeaux and Anjou wines, (three quarters red, and one quarter white.) Syrops, whitened linnens, fustians, coarse cloth, and other light woollen stuffs, ribbons, hats, jewels, household stuffs, and artificers tools.

But of all the merchandize, there is none whose sale is so sure, or that turns to better account than the castor from Canada, which often sells for ready money, though this is seldom the case with any others.

Furs are (as one may say) the foundation of the trade carried on with Muscovy, and the chief; and although they do not differ in quality from those of Lapland, Bora-dai, and Siberia, yet they are to be found here in greater quantities, on better terms, and with less risque. The Russia leather, dry or salted hides, goat, bear, or wolf-skins; hemp, flax, hogs-bristles, fish-oil, caviar, tallow, tar, wax, salted salmon, &c. are commodities that Muscovy yields, and of which the general staple is established at *Archangel*, which since its being frequented by the English, and afterwards by other nations, has carried away a great part of this trade from the Baltic, and particularly from Revel.

Of all these products and goods, the most esteemed are the hides of Jerossaw, the honey and wax of Pleskou, the tallow of Vologda, the oil in the neighbourhood of Volga, the flax and hemp of the great Novogorod, the pitch of Duina, and the fables and other furs of Siberia.

ARCHETYPE, the original or model from whence any performance is taken.

ARCHETYPE, the name given at the mint to the original weight, or standard, which is kept there, and by which all other weights ought to be examined and adjusted.

ARCHEUS, a term introduced by Paracelsus, and defined by his interpreter to be an invisible species, vague, and separating itself from bodies, the physician's power, and nature's virtue.

Van Helmont makes very frequent use of this word, and informs us, that the *archeus* consists in a connexion of the vital air, as matter with the seminal form, which

is the interior spiritual *nucleus*, containing the fecundity of the seed, and of which the visible seed is but the pod.

This *archeus* is the contriver and director of generation, investing itself with bodily clothing. In animate beings, it perambulates all the recesses of the seed, and transforms the matter, according to the *entelechiæ* of its own image, placing here the heart, and there the brain; and to every part assigning, out of its universal monarchy, a governor, according to its exigency and final use, which remains in its office till death; but the *archeus* is always fluctuating, and never fixed to any member, but keeps a watchful eye over every particular governor of a part, and is always clear and lively, but never idle.

From what has been said, we may perceive that these philosophers only meant nature by their *archeus*.

ARCHIFOU. See *ARQUIFOU*.

ARCHIPELAGO. By the word *Archipelago* is to be understood a cluster of small islands, of which there are many in different seas; but that we are now going to treat of is most necessary for the European merchants to know, being, as one may say, at their doors.

This *Archipelago* (being the only one that was known to the ancients) lies in the Egean sea; and the principal islands are, Argentiëre, Milo, Siphanto, Serpho, Antiparos, Paros, Naxia, Stenofa, Nicouria, Amorgos, Caloyero, Cheiro, Skinofa, Raelia, Nio, Sikino, Policandro, Santorin, Nanfio, Mycone, Delos, Syra, Thermia, Zio, Macronisi, Joura, Andros, Tinos, Scio, Metelen, Tenedos, Nicaria, Samos, Patmos, Fourni, and Skyros, which produce oil and olives, wine, corn, a sort of lichen for dying red, some ordinary, and some good silk, cotton, figs, masts, and planks, salt (at Milo) in vast plenty and very cheap, brimstone, great quantities of millstones (at Milo) flax, cheese, oxen, sheep, mules, cinny, laudanum, wool, goats hair, marble, cotton cloth, a small quantity of pitch, vallowea, honey, wax, scammony, several sorts of earth, capers, &c. which the natives sell to the several Europeans, who go here to purchase them.

Candia is a large island situated at the entrance of the aforementioned *Archipelago*, formerly known under the name of *Crete*; it carries on a considerable trade, and all the Christian nations, who traffic to the Levant, have consuls settled here. The chief towns of the isle are, Canea, Retino, Candia, and Girapetra; the neighbourhood of the principal place, as well indeed as all the rest of the island, are covered with almost an infinite number of olive trees, yielding very good oil, which is the principal product of it, and in such quantities, that in a common year are gathered at least three hundred thousand measures, of eight octues and a half, and the octues of three pounds two ounces: here are likewise purchased, wine, gum adraganth, laudanum, wool, silk, honey, wax, cheese, cotton, and wheat.

Salonica (the ancient *Thessalonica*) is a sea-port, seated at the bottom of the gulph, bearing the same name in the *Archipelago*. All the European nations trade here, but the greatest commerce is from Italy. This place is very fertile in corn. The other merchandize of *Salonica*, are tobacco (of which whole ship-loads are exported at a time) hides, cotton in wool, (better than that of Smyrna) yellow wax, brought here in large quantities from Turkish Valachia, unwashed wool, and some coarse woollen stuffs, for the cloathing of the poor people and soldiers.

The goods carried there are indigo, cochineal, ginger, pepper, cinnamon, mace, nutmegs dying woods, sugar, lead, pewter, block and single tin, cloths from England, France and Holland, paper, almonds, verdigrease, and sometimes coffee from the isles.

ARCHITECT, a person skilful in *architecture*, who designs and draws plans of structures, and directs the artificers in the execution.

Whenever a youth is destined for this business, he ought to have a peculiar taste for architecture, and from the force of genius be able to discover, not only the magnificence of buildings richly decorated with ornaments, but that beautiful simplicity, in some edifices, which only strikes the man of true taste. He should also have a lively and bold imagination. To such a genius ought to be added a liberal education; he should learn at least

Latin, French, and Italian; be acquainted with the mathematics, and in particular be skilled in geometry and surveying land. He should early acquire the art of drawing to great perfection; and having studied the works of Palladio, Vitruvius, and the other celebrated authors on this subject, should view the most celebrated buildings in England, improve and perfect his knowledge by travelling abroad, every where taking draughts with his own hand of those buildings that are most worthy of his notice, and making proper observations on their beauties and defects. On his return to England, he should make himself a perfect master in the theory of all the arts employed in building, and be acquainted with the secrets of the mason, statuary, carver, brick-layer, carpenter, and joiner; be a judge of the materials used by each, and know where the best hands are to be found.

With these qualifications, and an acquaintance with the great, he may be enabled to make a handsome fortune. This acquaintance is not however easily obtained by a professor in any art or science. But the English architect, while taking the tour of Europe, may have frequent opportunities of contracting some degree of intimacy with those placed by their birth in a rank much above him; by their being related as fellow countrymen, and connected as fellow travellers in a foreign nation: a relationship that is drawn closer in proportion to their distance from hence.

The profits of the *architect* are very considerable. He draws the plan of a palace, church, bridge, or other structure; in which he exhibits the whole building, with all its ornaments, formed upon a scale, with ground-plats of the several apartments, closes, &c. Besides these, he generally causes a model to be formed in wood also upon an exact scale: by which the employer has a distinct view of the design. When the gentleman has fixed upon a plan, they agree upon the price; and the *architect* either undertakes the whole work for a certain sum, or is only paid for superintending it. In either case, all the master workmen are generally of his own choosing, and such as he thinks capable of properly executing their several branches.

ARCHITECTURE, the art of building or erecting proper structures, either for habitation or defence.

This art, with regard to its objects, is generally divided into three branches, *civil*, *military*, and *naval*.

Civil architecture, is the art of designing and building useful and spacious structures for the various uses of civil life. And this is what is usually implied by the word *architecture*.

The time when this beautiful art was first invented is very uncertain: but as nature must necessarily direct mankind to secure themselves from the inclemencies of the seasons, and the incursions of enemies, *architecture* is presumed to be one of the first inventions human reason was capable of. Necessity occasioned the invention of *architecture*, and the vanity of men embellished it. The good and bad taste of people have successively spoiled and recovered it. In the earliest ages of the world, we are informed, that a city was built by Enoch in order (as is supposed by some) to defend himself and his family against the posterity of Abel, whom Cain, the father of Enoch, had murdered. The materials that were made use of in these ancient times, or the manner in which they were put together, is not easy to be determined at this juncture. Immediately after the flood, we find the Babel projectors making use of brick, and slime instead of mortar; what rules or orders were observed by these early builders, whether they embellished their works with any considerable ornaments, or whether they chiefly consulted bulk, grandeur, or convenience, are enquiries perhaps more curious than useful, and therefore need not be insisted upon.

The public structures among the Hebrews, if we consider either the magnificence of the temple, or the stateliness of their buildings in Jerusalem and other cities, are undeniable testimonies of their great skill in *architecture*.

With regard to the greatness or bulk of structures, we find the ancients, especially among the eastern nations of the world, infinitely superior to the moderns; for not to mention the tower of Babel, of which, an author says, the

foundations were to be seen in his time, which looked like a spacious mountain; what could be more noble than the walls of Babylon, its hanging gardens, and its temple to Jupiter Belus, which rose a mile high by eight several stories, each story a furlong in height, and at the top of which was the Babylonian observatory? The beautiful manner of building, which afterwards prevailed amongst the ancients, consisting of certain orders and rules laid down by the great masters of *architecture*, is supposed by some to have owed its origin to hints taken from the most simple materials, which are employed in building. The patrons of this opinion discover, or at least imagine they discover, a resemblance between the parts of a structure in its utmost simplicity, and the most elegant ornaments of *architecture*: they say, that the pieces of timber, of which the roofs and floors of houses are made, were the original of stone and marble pillars, of architraves, friezes, triglyphs, cornices, and other parts which constitute a fine piece of *architecture*. This is one account given of the original of *architecture*, which however is too plausible to be rejected as chimerical. The Greeks, to whom we owe several useful inventions, are thought to be the authors of this art, at least of those beautiful orders, which now make an essential part of it, viz. the *Doric*, *Ionic*, and *Corinthian*: these, we are told, were first practised in Greece, and from thence communicated to the rest of the world.

The Egyptians were the first who brought *architecture* to perfection; their *architecture* resembled their own character; it displayed over all a noble simplicity, agreeable to nature, and a greatness which filled the mind and charmed it. One reads with astonishment, in Herodotus and Diodorus, the description of the labyrinth, that is to say, of 1200 palaces composed of 1500 chambers, mixed with terraces, which communicated together around twelve halls, and left no outlet to those who entered.

Egypt always aimed at what was great. It raised monuments for posterity; its pyramids are still subsisting; the greatest has a base of 704 feet on every side, and its perpendicular height is 630; it ends in a platform of forty-eight feet in circumference; and its four sides are exposed exactly to the four regions of the world. As for the Persian *architecture*, it was very much ornamented; but these ornaments, though neatly wrought, want taste, and have nothing natural.

When the Goths and other barbarous nations broke in upon the Roman empire, and arts and sciences became a sacrifice to ignorance and barbarity, *architecture* was lost in the general confusion.

Instead of the beautiful order recommended and explained by that great artist, Vitruvius, an odd, fanciful, disproportioned way of building took place, which was afterwards called the *Gothic*, from the barbarous people who introduced it. Most of the ancient structures in England, and other parts of Europe, are of this kind, which is the reason that some of our largest and most magnificent churches are vastly inferior to the heathen temples, that were much less in bulk. "Let any one reflect (says Mr. Addison) on the disposition of mind he finds in himself at his first entrance into the Pantheon at Rome, and how his imagination is filled with something great and amazing; and at the same time consider how little in proportion he is affected with the inside of a Gothic cathedral, though it be five times larger than the other." The moderns have long since laid aside the Gothic way of building, and are returned to the ancient taste; they have found the rules and maxims, laid down by the Greek and Roman architects, to be the only rules that are perfectly consistent with beauty and true greatness. The usefulness and excellence of *architecture* will appear, if we consider how much it contributes to the convenience and satisfaction of life in general. As most civilized nations have owed their security to their skill in this art, so, where this kind of knowledge has been wanting, mankind has been continually exposed to the insults of neighbours, and perhaps been obliged to wander from place to place, for want of a proper defence to secure them in their possessions.

Architecture, therefore, well deserves the care of every well regulated state, it being an art that assists us in build-

ing, not only magnificent houses and places of worship, but ships, castles, and other structures necessary for the defence and ornament of society.

Architecture is a science which ought to be accompanied with the knowledge of a great many other arts and sciences; as optics, arithmetic, geometry, designing, gilding, painting, natural philosophy, medicine, law, &c. It was necessary among the ancients, that an architect should have skill in music, to string their catapults, and other warlike instruments; and to place musical vessels of brass in the theatres.

Another particular necessary to be acquired by an architect, is such a knowledge of the orders and proportions observed by the ancient Greek and Roman architects, as shall help to give him some notion of the beauty or excellency of a fine pile of building. Without some acquaintance with the orders and proportions of *architecture*, it is impossible to make a proper judgment of the beauty or excellence of any fabric whatsoever. A person, it is granted, without any extraordinary skill of this kind, may be sensibly affected at the sight of a magnificent structure, and conclude it to be the work of some great master. However, was he asked the reason of his opinion, he would be at a loss to defend it.

It is a regular disposition of the several orders of *architecture*, and an exact observance of the proportion of their respective parts, which gives that force, beauty, and greatness of manner, which is so much admired in good buildings. The Greeks and Romans were so happy in adjusting the height, breadth, and bulk of the several parts of an edifice, that any great neglect of their rules has been found to be a deviation from proportion and beauty itself. In short, wherever the rules of the ancients have been disregarded, and little fanciful ornaments introduced, as in Gothic buildings, there is nothing of that magnificence or grandeur, which appear in structures built after the Greek and Roman models.

A small building, where the ancient greatness of manner is observed, has such a force upon the imagination, that it shall give the mind nobler ideas than one twenty times the bulk, where the manner is ordinary and little. Mr. Addison has a good observation to this purpose, quoted from Mons. Freart's Parallel of the Ancient and Modern *Architecture*, which serves to let us see what is meant by greatness of manner. See his *Spectator*, N°415. In short, nothing is truly great or beautiful in *architecture*, but what is formed upon the ancient models, and agreeable to those rules and maxims laid down by the Greek and Roman architects. A number of little trifling ornaments in building are like puns in an epic poem, rather blemishes than beauties, and take off from the magnificence of the principal design.

The manner of the ancients, being then the standard of beauty and grandeur in building, we shall here give the reader a short view of the writings of the best authors upon this subject.

We have no Greek authors extant on *architecture*.

The first who wrote of it was Agatharcus the Athenian, who was succeeded by Democritus, Archimedes, and Theophrastus.

Among the Latins, were Fuscus, Terentius Varro, Publius Septimius, Rufus, and Epaphroditus. Pliny the Younger has likewise wrote a good treatise upon this art.

But of all the ancients Vitruvius is the only entire author, though Vegetius relates that there were seven hundred architects in Rome in his time. Vitruvius lived under Augustus, and composed a Complete System of *Architecture* in ten books, which he dedicated to that prince. He has divided his work into three parts, viz. building, dialling, and mechanics.

His rules for *architecture* were highly esteemed among the ancients, and are still the standard for practice among the moderns. He has been commented upon by Philander and Daniel Barbaro, and translated into many languages.

There are two things censured by the moderns in this excellent work, viz. want of method, and obscurity. The mixture of Latin and Greek, in Vitruvius, is such, that Leon Baptista Alberti has observed, he wrote Latin to the Greeks, and Greek to the Latins; he adds, that

the work contains abundance of things superfluous and foreign to the purpose. For this reason, M. Perrault has extracted all the rules out of Vitruvius's prolix work, and methodized and published them in a little abridgement.

Several authors have also endeavoured to explain the text of Vitruvius, particularly Philander, Barbaro, and Salmasius, in notes added to their several Latin editions; Rivius and Perrault in the notes to their German and French versions; and Baldus in his *Lexicon Vitruvianum*, enlarged by de Laet. The same M. Perrault has also composed an excellent treatise of the five orders, which may be esteemed a supplement to Vitruvius, who left the doctrine of the orders defective.

The authors upon *architecture*, since Vitruvius, are Leon Baptista Alberti, who, in 1512, published ten books of the art of building, in Latin, designed to outvie Vitruvius; in which, however, he has not succeeded: his work has abundance of good things, but is deficient in the doctrine of the orders. Seb. Serlio, who wrote seven books of *architecture*; five of which, concerning the five orders, were made public in 1602; throughout all which, he exactly keeps to Vitruvius's rules: the seventh was since published in 1675; but the sixth, concerning private buildings, has not yet appeared. And Palladio, who wrote four books of *architecture*, containing the fundamental rules of the art, with various instances of all the kinds of works, published in Italian in 1575; the two first books are rendered into High-Dutch, and enlarged with annotations, by Boeckler. Phil. de Lorme, who published nine books of *architecture* in French, in 1567. I. Barozzi de Vignola, who, in 1631, made public his rules of the five orders in Italian, since translated, with large editions, by Daviler, under the title of *Cours d'Architecture*, &c. and since also into High-Dutch, with notes.

To these may be added Vincent Scamozzi, his idea of Universal *Architecture*, published in 1615, in Italian. Car. Phil. Dieussart, in his *Theatre of Civil Architecture*, published in High-Dutch in 1697; wherein he not only delivers the rules of *architecture*, but explains and compares the five orders, as laid down by Palladio, Vignoli, Scamozzi, &c. which same design was also executed in French by R. Freart de Cambray, in a parallel of the ancient *architecture* with the modern, published in French in 1650, and since translated into English, with additions, by Mr. Evelyn. Fr. Blondel, director of the Royal Academy of Painting, &c. in 1698, gave a course of *architecture*, in French; being a collection from all the celebrated writers upon the subject of the orders, &c. Nic. Goldman, in a treatise of *Stylometris*, published in Latin and High-Dutch, in the year 1661, has done good service, by reducing the rules and orders of *architecture* to further degrees of perfection, and shewing how they may be easily delineated by means of certain instruments invented by him.

Lastly, the elements of *architecture* are very ingeniously laid down by Sir H. Wotton. The same are reduced by Sturmius and Wolfius, to certain rules and demonstrations; and thus was *architecture* brought into the form of a mathematical art; by the first, in his *Mathesis Juven.* and the second, in his *Elem. Matheseos*, tom. ii. an. 1715.

Military ARCHITECTURE, is the art of fortifying places, or strengthening them with walls, ramparts, ditches, &c. so as to enable the inhabitants to oppose the insults of their enemies.

Marine, or Naval ARCHITECTURE, or the art of ship-building, is not only founded upon the due application of geometrical principles with great judgment and delicacy, but on those of hydrostatics, as the honourable Mr. Boyle observes. A person to be thoroughly skilled in this useful art, requires to be well informed in all the curious problems, theorems, and paradoxes, with which that great man, and others, have favoured the world upon that subject.

In order to complete the art of ship-building, it has been observed by some ingenious practical artists in this branch, that hydrostatical experiments for this purpose should be made upon salt water, and not fresh, as the chief of them have been.

It has been said by others also, that the shipwright should be as good a mariner, as marine architect, and

know as well how to sail, as build a ship; the reason given for this is, that, in practical navigation, the ingenious shipwright, skilled therein, will remark variety of particulars, which will guide him in his *architecture*, which the mere shipwright can form no idea of.

It is not for want of genius in shipwrights, that the practical part of ship-building is not carried to a greater perfection: but for want of their not being so regularly bred in these kingdoms, as might be desired, considering that our whole commerce and navigation so greatly depend upon that art; for the qualifications requisite to render a person a complete master of this art are really so many, as well in regard to the theory as practice, that it is very rare, indeed, that such qualifications are united in one man. It has been observed, therefore, by some wise and great persons, that our successes by sea have been more owing to the strength of natural genius in our mere practical shipwrights, or rather to chance, than to any competent knowledge in those parts of the mathematics and philosophy, which are indispensibly necessary to excel in that art.

From the year 1617 to 1656, ships of three decks were from thirty-eight to forty feet broad; the St. Michael, by Sir John Tippets, but forty-one feet eight inches; the London, by Jonas Shiff, but forty-four feet, and carried a hundred guns: since that, several ships, of forty-eight feet broad, have been obliged to be girdled.

The Monk, by Sir John Tippets; the Rupert, by Sir Anthony Deane; the Mary, by Mr. Pett; the Dreadnought, by Sir Henry Johnson, all third-rate men of war, belonging to the royal navy of England, and but thirty-six feet six inches broad; the Cambridge, by Mr. Shiff, but thirty-eight feet; and the Royal Oak, no more than forty, and each of them carrying seventy guns; and, since then, two deck ships of forty-two feet broad have miscarried.

The Royal Catharine was contrived by the Royal Society, and yet was girdled; the double-keeled experiment was also made by that society.

Since miscarriages in our ship-building are often attended with very prejudicial, and sometimes with very fatal consequences to the nation, this art cannot be too judiciously cultivated, nor too zealously promoted.

It has been observed by some, that a ship ought to be considered three principal ways. First, by trying her body below the deepest draught of water, whether the shape be truly circular or not, according to the course of the water, and not by horizontal parallels, which will enable us to form a true judgment, whether she will sail swift or not. Secondly, by observing the shape or frame of the ribs, which will inform us whether she is well contrived to bear the sail that is designed, or in the shipwright's phrase, whether she be stiff, or tender sided. Thirdly, by considering the due connection of such a machine: which three observations being skilfully made, will form, as some say, the hull of any ship perfect and complete.

Others are of opinion, that the resistance in the water is according to that cross section, which is made by the midship, or the largest part of the ship, considering only the angle of incidence; that every ship principally resists the medium at her broadest part; also that the mass of water which resists a ship, is not resisted by her till it has passed by her biggest part; and that, if two ships were formed ever so different, the one ever so acute, and the other as obtuse as possible, yet, if their cubic inches under the surface of the water, and the power driving them were equal, the trim indifferently considered, their velocities would be equal.

Upon the whole of this article of *architecture*, it may be said, that it is certain that those nations, which have no stately and magnificent buildings in general, are always poor and uncivilized. Land structures and edifices of every kind, by giving employment to prodigious numbers of people, whatever has a tendency to improve the art of building, should be duly encouraged by those whose fortunes and distinction will admit of it; and this not only for the splendor and magnificence of the state, but for the promoting of useful arts, and benefit of landed estates: for this art gives birth to the immense consumption of timber, bricks, stone, mortar, iron-work, &c. all which tend to the private advantage of

the landed interest; as does likewise the well furnishing of those sumptuous edifices, whereby daily bread is acquired for an infinite number of other mechanics and artificers. Add to this, these mechanic arts give strength, wealth, and grandeur, to a nation, and gradually train up and support a constant race of practical artists and manufacturers, who thereby become the great instruments of bringing treasures into the state, by the vent of our native commodities to foreign nations.

Besides *civil architecture*, it may not be for the interest of England wholly to neglect the *military*, as we have experienced upon some late occasions, more especially while other nations are assiduous in the improvement of the art of fortification: but, as to *marine architecture*, or the admirable art of ship-building, it should be thought needless, by every true friend to the interest of the trade and navigation of Great Britain, to urge a word in favour of the study and improvement of an art, upon which our all seems to depend, both as a free and a trading people. See SHIP-BUILDING.

ARCHITRAVE, in architecture, is the lowest member of the whole entablature, being that which lies immediately upon the capital. Authors are very different in their dimensions of *architraves*, and even as to the number of members it is composed of.

The Tuscan *architrave*, according to Vitruvius, should consist of two fasciæ and a cymatium, and be half a module in height. The Doric should be of the same height as the Tuscan, and consist of a tænia, and five fasciæ. The Ionic should be composed of three fasciæ and a cymatium, and of the same height as before. The Corinthian *architrave* should be allowed a greater altitude than the former, and consist of a cymatium and five fasciæ. The composite *architrave*, frieze, and cornish, he makes of an equal height, and each equal to the diameter of the column just under the capital, which is ten twelfths of a module.

ARCHITRAVE doors, are those which have an *architrave* on the arch, if the top be curved; but, if strait, upon the cap-piece.

ARCHIVAULT, in architecture, is the inner contour of an arch, or a band or frame adorned with mouldings, running over the faces of the arch-stones, and bearing upon the impost. It is different in different orders. In the Tuscan it has only a single face; two faces crowned in the Doric and Ionic; and the same mouldings with the *architrave* in the Corinthian and composite.

ARCHIVES, the rolls, or any place where ancient records, and charters, and evidences are kept; also the *Chancery*, or *Exchequer-office*, also the private repository in libraries. Couvel.

ARTIC Pole, in astronomy, the north pole, or that elevated above the horizon in north latitude.

ARTIC Circle, a lesser circle of the sphere parallel to the equinoctial, and $66^{\circ} 30'$ distant from it towards the north pole. See POLAR Circle.

ARCUATION, the raising of trees by layers. The first thing that is to be done, is to procure strong mother plants, which are usually called stools. It is no matter whether the trees be crooked, or otherwise deformed; and the larger they are, the better they are to cut down close to the ground. They are to be planted in a border six feet wide, and in a strait line six feet asunder.

The border must be well trenched or dug, and cleared from all roots, clods, stones, or any other obstructions. These trunks, or stools, being planted in this trench, will throw out twenty, thirty, forty, or fifty shoots, which may be laid about the Michaelmas following; at which time, if the stools have been carefully managed, they will have shot five, six, or more main branches out of the root; and on every one of these, as many side, or collateral branches.

These main branches must be bent down to the ground; and some cut them half through, that they may bend the easier. When the main branches are thus laid round the stool, and pegged fast down, then the small ones may be pegged down too, if you please, and thus the main branches, or shoots, will be covered all over, except the very top, and all the small and fine branches must be covered three inches thick upon the

joints; some persons give the branches a twist, in order to make them take root the sooner. If they be mulched, or some straw dung laid over them, it will be of use to keep them moist; they ought also to have a large basin of earth made round them to hold the water, in order to water them the ensuing summer; which they will require sometimes, if the weather be hot and dry.

About the middle of September following, they may be opened and examined, to see if they have taken root or not, which it is very probable they will have done; but if not, they must be let alone, to lie till the next autumn; when they are to be taken up, and planted in the nursery.

This may be done to the Dutch witch, and English elm; the abeel, lime, alder, platanus, and all sorts of fallows and willows, as also many sorts of ever-green trees, and flowering shrubs. Miller.

ARDASSINE. See SILK.

ARDRES. See AFRICAN COASTS.

AREB, a nominal money used in accounts in the dominions of the Grand Mogul, equal to five shillings sterling.

ARECA, *Indian nut*; the inspissated juice called *catechu*, and *terra Japonica*, or Japan earth. The Japan earth of the shops is a hard, pulverable, gummy-resinous juice, outwardly of a reddish colour, almost black, with a cast of red, of a bitterish astringent taste, followed by a sweet and more grateful one. It is brought from Malabar, Surat, Pegu, and other parts of India, but is not the produce of Japan; nor is it an earth; for when pure, it communicates a dark brown colour to water, and dissolves in it, so as to pass a strainer, without leaving any feces: great part of it likewise proves soluble in spirit of wine, to which it gives a somewhat brighter tincture, than to water. Powdered and thrown on a red hot iron, it emits a copious fume, melts, takes fire, sometimes flames, and leaves behind a small portion of greyish ashes. Some authors are of opinion, that this is not the juice of any one particular tree, but is drawn indifferently from any, or all of the species of acacia, and from the fruit of a kind of palm, which is very like a date. It is said that the Indians prepare this juice from the *areca nut*, before it is quite ripe, by boiling the nut in water, impregnated with some oyster-shell lime, till the liquor has acquired a dull red colour; the decoction is then decanted from the feces, and inspissated to a proper consistence.

The chief use that is made of the *areca* is to chew it with the leaves of *betle*. The Europeans who live at Batavia, Malacca, and in the Sunda and Molucca islands, use it as much as the Indians do. Some pretend that the mastication of *areca* strengthens the stomach, when the juice of it is swallowed, as most of the Indians do. Another property ascribed to it is, its curing, or carrying off, all that might be unwholesome or corrupt in the gums. The Dutch East-India company send a great deal of it in their ships into the kingdom of Bengal. There grows, or is prepared in Malabar, a sort of red *areca*, which is very proper for dyeing in that colour. The same company send some of it from time to time to Surat and Amadabat, for the use of the dyers in the dominions of the Grand Mogul.

ARGEMONE, *Tourn. Instit. R. H. 239. Tab. 121. Lin. Gen. Plant. 574. The Prickly Poppy*. The seeds of this plant were brought from America, by the title of "Figo del Inferno," or "Ficus Infernalis," the Infernal Fig; supposed to be so called from a resemblance between the seed-vessel of this plant and the fig; but being closely beset with prickles, it may have endangered the lives of some ignorant persons, who have attempted to eat it. The whole plant abounds with a yellow juice, like thecelandine, which flows out on the plant's being broken or wounded. The seeds of this plant are used in the West-Indies to purge; and the juice of it is esteemed good for sore eyes. It is also there used for many other disorders, but in Europe, I believe, it is not used in medicine. Miller.

ARGENTUM Dei, God's money; that is money given in earnest upon the making any bargain. It is still called God's penny in the North: I have met with this only in one authority of taking such money in hand as

an earnest of a remaining sum. *Placit. apud Castr. 2. Ed. III.* Hence *arles*, earnest; and *arles-penny*, now used in Yorkshire, where they likewise call servants vails *arles*. *Couvel.*

ARGYLESIRE. This shire is generally fitter for pasture than tillage, though it produces corn in great plenty; its rivers afford abundance of salmon, as its coasts do of herring, cod, and whittings. *Lorn* is the pleafantest and most fruitful part of it, and the inhabitants are more given to fishing and hunting than to any manufactures.

ARICA, though it is the least considerable city of Peru, for the number of its inhabitants, and beauty of its buildings, there is scarce any place, which in so small a time, transacts so rich a commerce; its warehouses being, for fifteen days, the depositories of all the treasures from Potosi; and of the silver fleet, which yearly fails with the king's revenue, and the produce of the mines for Lima, to be afterwards forwarded by the way of Panama to Porto Bello, in the North Sea, for the galleons. This treasure is brought from Potosi to *Arica* in March; and in June the Lima ships come to load it. The city is situated 18 deg. 40 min. of latitude, seventy leagues from the city of Potosi, to which it, however, serves for a loading place, as before-mentioned.

The merchandizes which are brought from Lima, and other parts of Peru, to *Arica* for Potosi, are European cloths and ferges, with others from Quito, where the best woollen manufactures are of all Peru. Gold, silver, silk, and cotton stuffs; these here made in the country, and the others coming from Spain by the galleons; flour, wheat, maiz or Indian wheat; *acicoca*, an herb serving instead of Paraguay; *Ariquipa* wines, the best of Peru, where the king of Spain permits the planting vineyards; oil, olives, butter, cheese, sugar, salt, quicksilver, sweet-meats, syrups, and all sorts of hard-ware, and iron utensils for the service of families and the mines; all which are paid for in the latter's argentine produce, because the city of Potosi, called also an imperial city, being seated in a country so barren and unfruitful, would furnish nothing to trade, if its mountains did not cover those inexhaustible silver mines they do.

ARISH, a measure of length in use among the Persians, which, Dr. Arbuthnot says, is equal to 3197 English feet.

ARISTOLOCHIA, *birthwort*, in botany, the name of a plant, whose root is of considerable use in medicine. There are several species of this plant, but those generally used in physic are the *aristolochia longa* and *rotunda*, long and round birthwort. The first is of a sub-acrid aromatic taste, and by all accounted a cleanser of the womb, both as a provoker of the menstrual discharges, and a forwarder of delivery. It has ascribed to it also some alexipharmic qualities, and is therefore an ingredient in the composition of the theriaca, and some others of the same tribe. It is reckoned detergent externally, and suppurative; for which reason it has a place in the styptic plaister, both of Crollius and Paracelsus. Johannes Faber made from this an extract and an essence.

The round birthwort differs not from the former but in shape, has the same virtues ascribed to it, and enters into the same composition as the former. This grows chiefly in France, as the former does in some parts of Italy. There is also described by botanists a creeping birthwort, intitled *saracenia* by Gerhard, and *clematitis vulgaris* by John Bauhine; but this seldom comes into the shops, or is used in medicine.

ARITHMETIC, the art of computing by numbers, or that by which we discover what number of quantities there are, either real or imaginary, of any kind, contained in another quantity of the same species.

Proclus in his Commentary upon the first book of Euclid, says, that the Phœnicians, by reason of their traffic and commerce, were thought to be the first inventors of arithmetic, which Pythagoras and his followers, as also the Egyptians, Greeks, and Arabians afterwards much improved, as Clavius and others tell us. But if we are to judge of the knowledge of these ancients in arithmetic from their writings upon the subject, which have been transmitted to us, we may safely conclude, that

their advances herein were but very scanty and imperfect. For, setting aside Euclid, who indeed has given several very plain and pretty properties of numbers in his *Elements*, and Archimedes in his *Arenar*, they mostly consist in dry disagreeable distinctions and divisions of numbers; as may be seen in Nichomachus's and Boetius's Arithmetic.

Nor is the Greek manner of numeration, by the letters of the alphabet at all fit for the performance of the practical part of multiplication, division, &c. with the ease and expedition that they are now performed by the Arabian figures, or nine digits.

Dr. Wallis, in his History of Algebra, says, that there are at Oxford two arithmetical manuscripts of Johannes de Sacro Bosco, who died about the year 1250, wherein the operations of addition, subtraction, multiplication, division, and extraction of the square and cube roots, are performed much the same as now.

Boetius's arithmetic was wrote in the sixth century, and in the ninth century, Pselius wrote a Compendium of the Ancient Arithmetic in Greek, which was translated into Latin by Xylander, and published in 1556, at Basil. Such a Compendium too was published by Willichius in 1540. Other writers are Jordan, whose Arithmetic was published in 1480; Barlaam the monk, Frater Lucas de Burgo, Stifel, Nicholas Tortaglia, Maurolycus, Henrichius, Andreas Tacquet, Clavius, Leotaude, Wells, Metius, Gemma Frisius, Wingate, Kersey, Boyer, Hatton, Cunn of Fractions, Weston, with a multitude of others, too many to be enumerated here. But the best and most absolute work of this kind, both as to matter, order, clearness of expression, and even language, is the System of Arithmetic, published in our language not many years since, by the very ingenious Mr. Malcolm.

Theoretical ARITHMETIC, is that science which shews the various properties of numbers, and the reasons and demonstrations on which the several practical operations are founded.

Practical ARITHMETIC, is the art of computing or performing the several operations, and applying them to practice.

Instrumental ARITHMETIC, is the art of performing the several operations by the help of instruments; as Gunter's scale, Napier's bones, &c.

Logarithmetical ARITHMETIC, is the doctrine of logarithms.

Vulgar ARITHMETIC, is the doctrine of integers and vulgar fractions.

Decimal ARITHMETIC, is the doctrine of decimal fractions.

Binary ARITHMETIC, is that wherein an unity, or 1, and 0, are used.

This was invented by Mr. Leibnitz, who has shewn it to be very useful in discovering the properties of numbers; and M. Danicourt, in the *Mem. de l'Acad. Roy. des Scien.* 1703, has given us a specimen of it with regard to arithmetical progression, where he observes, that as in binary arithmetic two characters only are used, the laws of progression may be more exactly discovered by it, than by any other method.

Tetraſtycal ARITHMETIC, is that wherein only 1, 2, 3, and 0, are used. There is a treatise of this arithmetic extant, written by Mr. Echard Weigel, a German: but both this and binary arithmetic are only useless curiosities, especially with regard to the practical part, since the decimal or common arithmetic is received by all nations, and ingrafted in us, whilst children; and also because numbers may be vastly more compendiously expressed by the common methods, than by either of these.

Sexagesimal ARITHMETIC, is the doctrine of sexagesimal fractions.

Specious ARITHMETIC, is the same as algebra, or the art of computing by symbols.

ARITHMETIC of Infinites, is the method of summing up a series or row of numbers, consisting of infinite terms, or of finding the ratios of them. This method is, at present, rarely used, the doctrine of fluxions, which is far more general, and performs the same thing much easier, being commonly practised.

Decadal or Common ARITHMETIC, is that which is performed by nine figures and a cypher. This is generally

rally supposed to be invented by the Arabians, and was, no doubt, taken from the number of our fingers; because, in computations, we use our fingers, before we understand arithmetic.

Political ARITHMETIC, is the art of calculating the power of states, and the profits of their commerce, by estimating the number of their inhabitants, the quantity of provisions and manufactures consumed by them, the quantity and value of their labour, the value of lands, the profit of navigation, &c. From these calculations, a variety of inferences are drawn by experienced statesmen and financiers for the improvement of agriculture and the advancement of trade and navigation.

The calculations of this kind which Sir William Petty attempted, Dr. Davenant gives some good reasons why many of his numbers are not to be entirely depended on; and therefore he advances others of his own, founded on the observations of Mr. Greg. King.

The land of England, he says, is 39 millions of acres; the number of people about 5,545,000, increasing about 9,000 every year, allowance being made for plagues, &c. wars, shipping, plantations. The people in London he reckons at 530,000; those in the other cities and market-towns 870,000; and those in the villages and hamlets at 4,100,000: the yearly rent of the land he accounts to be 10,000,000*l.* that of the houses and buildings, 2,000,000*l.* *per annum*; the produce of all kinds of grain he reckons to be worth 9,075,000*l.* in a moderately plentiful year; the rent of the corn-lands annually 2,000,000*l.* and their net produce above 9,000,000*l.* the rent of the pastures, meadows, woods, forests, commons, heaths, &c. 7,000,000*l.* The annual produce in butter, cheese, and milk, about 2,500,000*l.* The value of the wool, yearly shorn, about 2,000,000*l.* Of horses yearly bred, 250,000*l.* Of the flesh yearly consumed, about 3,350,000*l.* Tallow and hides, about 600,000*l.* Hay yearly consumed by horses, 1,300,000*l.* By other cattle, 1,000,000*l.* The timber yearly felled for building, 500,000*l.* Wood yearly burnt, &c. 500,000*l.* The land of England is now about seven acres one quarter to each inhabitant. The value of the wheat, rye, and barley, necessary for the sustenance of England, at least, 6,000,000*l.* *per annum*. The value of the woollen manufacture made here, is about 8,000,000*l.* *per annum*; and our exports of all kinds of woollen manufactures above 2,000,000*l.* *per annum*. The annual income of England, on which the people live, and out of which taxes of all kinds are paid, is now about 43,000,000*l.* that of France 81,000,000*l.* and Holland 18,250,000*l.*

Major Grant, in his observations on the bills of mortality, computes, that there are 39,000 square miles of land in England; that in England and Wales there are 4,600,000 souls; that the people of London are about 640,000, and one fourteenth part of the people of England. That in England and Wales there are about 25 millions of acres, being about 4 acres to every head. That but 64 out of 100 of the children born are living at 6 years old; but 40 at 16; but 25 at 26; but 16 at 36; but 10 at 46; but 6 at 56; but 3 at 66; but 1 at 76. And that London doubles itself in about 64 years.

Sir William Petty, in his discourse about duplicate proportion, says, that it is found by experience, that there are more persons living between 16 and 26 than of any other age; and thence he infers, that the square roots of every number of men's ages under 16 shew the proportion of the probability of such persons reaching the age of 70.

Thus, it is four times more likely, that one of 16 years of age lives to be 70, than a child of 1 year old; it is thrice as probable, that one of 9 years lives to be 70, as such a new-born child, &c. That the odds is 5 to 4, that one of 25 dies before one of 16; and so on as the square roots of the ages.

Dr. Halley has made a very exact estimate of the degrees of the mortality of mankind from a curious table of the births and burials at the city of Breslaw, the capital of Silesia, with an attempt to ascertain the price of annuities upon lives. From the whole, he makes the two following very good observations: 1. That, in a great measure, we may justly complain of the shortness of our lives; for that

it appears, that one half of those that are born do not live above seventeen years; and, 2. That the growth and increase of mankind is not so much stunted by any thing in the nature of the species, as it is from the curious difficulty most people make of venturing on the state of marriage; and therefore, that celibacy ought to be every way discouraged by all wise governments; and those who have numerous families of children encouraged by good laws, such as the *jus trium liberorum*, &c. among the Romans. See ANNUITIES.

As a necessary inference from the premises, it may be said, that speculations in the closet, which have not been enlightened and assisted by practice and experience, will be very uncertain guides to him who desires to know the state and condition of a country. Any one therefore, and more particularly a statesman, who would compute with any effect, conducive to the public good, must consult variety of men, and men of different talents; and thus by contemplating the universal posture of the nation, its power, strength, trade, wealth, and revenues, in any counsel he is to offer, by fumbling up the difficulties on either side, and by computing upon the whole, he shall be able to form a sound judgment, and to give a right advice; and this is what should be properly meant by *Political Arithmetic*.

He that has such a computing head will seldom enter into ill measures; he will not put the wars of his prince upon a wrong footing; he will not engage him in weak alliances; he will not propose ill digested schemes and funds for revenues that shall not answer. In any new counsel, he will weigh the event beforehand, and consider how far it may disturb his master's affairs; or affect the nation's credit. Happy are those kingdoms which abound in statesmen so qualified; but miserable is that country, where the men of business do not reckon right; and where, in matters very important, and on which the whole welfare of a people depends, they are allowed to say, They are mistaken.

This computing faculty may not only be useful to statesmen in the general and higher affairs, but it will likewise help them in the more subordinate and ministerial parts of government. It will not only contribute to their well guiding and conducting the nation's whole strength and wealth trusted to their care; but if they know rightly how to reason upon things by figures, they will commit very few errors in relation to their prince's revenues, or to the trade of the kingdom.

There are few places which afford better helps for computation than England does at present. The excise, the customs, and land-tax, are criteria, by which we may judge, not only of what the people consume, but, in some sort, they let us into a knowledge how their numbers increase or diminish. Those duties are the very pulse of a nation, from which its health or decays may be observed. And these revenues must be the better guide to computers, because the accounts of them are fairly kept and stated, and because the respective branches have been under so exact a management, that their produce is known and understood.

The wealth of all nations arises from the labour and industry of the people: a right knowledge therefore of their number is necessary to those who will judge of a country's power and strength. And upon this account, undoubtedly, the Romans did so often make the *census*, that a judgment might from thence be formed, how able the commonwealth was to defend itself, or to invade others.

And the son David committed in numbering Israel, might be probably this, that it looked like a second proof of rejecting Theocracy, to be governed by mortal aids and human wisdom. For without doubt, it must very much help any ruler to understand fully that strength which he is to guide and direct; since he may thereby know how many are fit for war; what hands support the commonwealth by their labour and industry; and what sort of men are idle and useless in it.

This is so far from being a matter of mere speculation, that very many conclusions may be thence drawn, useful and reducible to practice. For if the numbers of the people can be truly stated, if they can be divided into proper ranks and classes, if it can be distinguished who are rich,

rich, who are at their ease, who can barely subsist, and who, by reason of poverty, can contribute little in any tax or aid to the public; if all this can be thoroughly understood, in the laying any kind of tax or imposition, a very near computation may be made, what such a duty should produce to the government, supposing it to be duly collected, and under a good management.

When the different ranks and qualifications of men are divided and stated; when there is a right distinction made between the number of solvent and insolvent persons; when it is known how many pay not to church and poor, how many receive alms, and how many are mere vagrants, a very good judgment may be made what any personal or family-tax ought to yield, still supposing it to be well and carefully levied.

The number of the people leads us to know what the yearly income may be from land, and what from mines, houses, and homesteads, rivers, lakes, meers, ponds; and what from trade, labour, industry, arts and sciences; for where a nation contains so many acres of arable land, so many of pasture and meadow, such a quantity of woods and coppices, forests, parks, and commons, heaths, moors, mountains, roads, ways, and barren and waste land; and where the different value of all this is computed, by proper mediums, it is rational to conclude, that such a part of the people's expence is maintained from land, &c. and such a part from mines, houses, &c. and that such a part is maintained from trade, labour, &c. And the poor exceeding so much the rich in numbers, the common people are the medium by which we may judge of this expence.

There is a certain sum requisite to every one for food, raiment, and other necessaries; as for example, about 10*l. per annum*; but some expending less, and some more, it may not be improper to compute, that the mass of mankind in England expend, one with another, near 10*l. per annum*; from whence it may be concluded, that an annual income of so many millions is needful for the nourishment of such and such a number of people.

And if land with its product will not reach this sum, it is rational to infer, that the rest must arise from trade, arts, and manufactures. And further, when a nation contains such a number of people, skilled in husbandry and the improvement of land, when they have such an extent of territory, and when their acres are, one with another, of such a value, it may be from thence concluded, that the land of this country will produce such and such a sum.

So much of the product of the earth will nourish such a number of the people; and a soil, so and so improved, will yield such a product; and if this be above what the people consume, it follows, that there must be such and such a quantity of goods for exportation.

Such a number of men skilled in maritime affairs, versed in traffic, with variety of ports, dealing to many countries, with such and such a native product to export, and such an acquired stock to turn and wind, must gain so and so by trade.

And if land and trade do not reach the expence in question, it follows, that the rest must arise from arts, manufactures, and the other business of a people.

But if land and its product with what is done at home, is sufficient to nourish such a number of inhabitants, and that they are able besides to export many commodities and manufactures, and that their stock is such as to deal in many goods with foreign people; we may infer, that there is superfluous wealth accruing to such a country by their traffic.

Therefore a right distinction to be made between what part of the people's expences arises from land, &c. and what from trade; and what from arts, labour, &c. must be a good guide to princes and states, in laying any kind of taxes or impositions. Expence must arise from income; and suppose the general income of a nation, from land, trade, arts, &c. should be

Suppose of this, land to be	14,000,000	} 44,000,000
Trade, —————	10,000,000	
And arts, labour, &c.	20,000,000	

And where this is the case, can it be reasonable in taxing the people to lay almost the whole weight upon the twenty-four millions, and to let the other twenty milli-

ons in a manner escape; and yet this must happen, for the whole burden is generally put upon land and trade.

So that such a *political arithmetic*, as could distinguish in all the different parts which compose a nation's wealth, must be very useful and of public service.

The eighth penny raised upon the annual income or expence of England, would have maintained the war of king William a great while, on the footing of five millions a year, if the burden had been laid upon all degrees of men alike, with geometrical proportion; for, in all probability, an *equal* land-tax and moderate duties upon the whole consumption, would have produced such a sum; and if this could have been computed, the landed men had undoubtedly been in a better condition than they are at present, and we had avoided the vast debt, which was a weight upon the king's affairs.

This computing faculty consists in comparing the strength of nations, and in considering their number, power, politics, wealth, trade, shipping, naval force, land armies, and alliances.

But there is in this art a sphere for lower capacities to move in, who can presume no further than to find out and prepare materials, to be made use of by abler hands, and who think it praise enough to them, if they can make tools for skilful artists to work withal.

If general computations had been more studied and improved, those errors relating to the revenues must probably have been avoided, which have so entangled the public affairs.

If some of the men of business had consulted *political arithmetic*, the parliament had not been troubled every session, to make good so many deficient funds, which have loaded England with a heavy debt.

Most undoubtedly, a right skill in this art would be of great use in all considerations relating to the public revenue; for though the number of people could not be certainly fixed, and though the consumption of any commodity could not be truly known; yet he who goes by some rule, though not capable of a mathematical proof, shall seldom err, than he who gropes entirely in the dark, and only follows the suggestions of his fancy.

The projectors of most new funds have hitherto been generally mistaken two parts in three: That art is therefore to be praised, the rules of which, if rightly followed, will shew *a priori* with a small difference, what any branch of the revenue shall produce, making allowance for the difference between war and peace, or any other extraordinary occurrences. In all computations, the number of people is the ground-work; yet that knowledge will be but an uncertain guide, without other helps and directions. For in reckoning what any branch may yield, consideration must be had of the present abilities and condition of the kingdom, of the current cash, and of the disposition of the people to pay the duty. The nature of the commodity likewise to be charged must be considered, whether it be the proper object of a duty, and not easily concealed and evaded, and whether its collection is to be ascertained by high or easy penalties; and whether it is to be come at by a few or many officers; and the law itself, which is to give the duty, must principally be weighed; for if it is to be slackly penned, the branch will answer accordingly. By an universal contemplation of these matters, and by making every where proportionable allowance, in all the foregoing and some other instances, a judgment may be formed, what sum the government may reasonably expect from any new revenue.

And, in computing any new duty, the number of the people will be an uncertain guide to those who do not distinguish rightly, between the rich and the poor of a country; for in most computations, men are led into error, by reckoning and concluding, from what is in view, and just before them. But they who will make a true estimate in things of this nature, must consider the mass of the people together, and not measure the riches of the whole by that plenty and pomp which they see among a few.

He who will pretend to compute must draw his conclusions from many premises; he must not argue from single instances, but from a thorough view of many particulars; and that body of *political arithmetic*, which

is to frame schemes reducible to practice, must be composed of a great variety of members.

He who will arrive at this art must look into all the public revenues; he must understand something of their management; he must not be a stranger to the product and manufactures of every country and place; he must know what goods we export, and what foreign commodities are imported to us; and only from this general view, he must frame any scheme that may be useful to the public. A contemplation of one object shall give him light into things, perhaps, quite of a different nature; for as in common arithmetic, one operation proves another, so in this art variety of speculations are helpful and corroborative of each other.

Nor is the faculty of computing less useful in matters relating to trade, than in what concerns the public revenues.

The councils of a country are always inquisitive after truth, but to hide it from them, and to perplex things which have relation to trade, is the interest of so many, that in the greatest deliberations, wise men are often misled by such as in all their actions consult more their private profit than the common welfare.

There is hardly a society of merchants, but would have it thought, that the whole prosperity of the kingdom depends upon their single traffic.

So that at any time, when they come to be consulted, their answers are dark and partial; and when they deliberate themselves in assemblies, it is too frequently with a bias, and a secret eye to their own emolument.

There is hardly a commerce, but the dealers in it will affirm, we lose all by the rest; when, perhaps, in time of established peace, the kingdom gets by trade in general.

A true account of the balance of trade would set all this right, and shew what traffics are hurtful, and what are beneficial to the nation; and the general balance is not to be accurately found out, but by the aid of *political arithmetic*, and a skill of foreign exchange. And perhaps this art alone can shew the links and chains by which one business hangs upon another, and the dependence which all our commercial dealings have each upon the other.

At first appearance, those traffics seem hurtful which export money; but when we come to reason upon things by figures, we find, that such trades are often beneficial, when they bring in one way more bullion than they carry out another.

We may seem to lose by the balance in one place; but perhaps that trade may be the cause of another twice as profitable; so that to object against the motion of one wheel, without knowing and seeing how the whole engine moves, is to no manner of purpose.

He that would therefore compute with any good effect in matters relating to trade, must contemplate the wealth, stock, product, consumptions, shipping, exportations, and importations of his country; and at the same time he must consider the state and condition of other places.

In this art, the most defective point is, to find good materials, and to have a footing probably sure to fix our reasonings upon; for where our premises can be certain, our conclusions shall be almost undeniable.

It is a great guide in concerns of this nature, to have before us an account of all the exportations from London and the out-ports, to every distinct country; and also of all the importations to London and the out-ports, from every distinct country, and of their values at prime cost, and so downwards. Every commodity should be under a separate head, and the drawbacks upon re-exportation taken due notice of, and the value taken into consideration, where the duty on goods is *ad valorem*. These materials are very helpful in our computations of this kind.

But it would be a further light into the general balance of trade, if we could form a good judgment of that beneficial trade of buying goods in one place, to sell in another country, and what we gain by the articles of freight. If the true state of these matters could be obtained, it would greatly contribute to our information in regard to the general loss or profit made by commerce.

The general posture of our traffic, as well in time of

war as peace, is likewise requisite to be taken into consideration; for by contemplating the various charges in our exports and imports in those different junctures, a judgment may be formed, from *political arithmetic*, how the balance of trade formerly stood, and how it is like to stand hereafter, with the several countries wherewith England has commercial negotiations.

These are the out-lines of the art of *political arithmetic*; and how far this work may contribute to give the reader some knowledge of the art itself, can be known only by those who shall peruse the work throughout; wherein they will find multiplicity of matter, tending to information of this kind.

ARITHMETICAL Complement of a Logarithm, is what it wants of 10,000000. Thus, the arithmetical of complement of 3.219063 is 6.780937.

ARITHMETICAL Mean, is the middle term of three quantities in arithmetical progression. Thus, 7, 9, 11; are three terms in arithmetical progression, whose mean is 9.

ARITHMETICAL Progression or Proportion. See PROGRESSION.

ARM of a Magnet. A loadstone or magnet is said to be armed, when it is inclosed, capped, or set in iron or steel, in order to increase its magnetic virtue, and distinguish its poles with the greater facility.

ARM, in geography, a branch of the sea, or of a river.

ARMADA, a Spanish word, which formerly signified a number of ships of war; but of late years, it not only comprehends a navy composed of ships of war, but a fleet of merchant-men under their convoy.

There is a royal *armada*, or navy, to secure the navigation of the galleons from Old Spain to the Spanish West-Indies.

The laws of trade in Spain direct, that, provided there be no special order to the contrary, two flotas set out, the one for the Terra Firma, the other for New Spain, and the *armada* to convoy them; but this name of *armada* was meant of the admiral and vice-admiral only, which were fighting ships; and, at first, there was one man of war to convoy the rest; her burden being 300 tons, and carrying eight brass cannon, and four iron guns; and the merchant-men, till then, carried 100 tons less than their burden, and thirty soldiers each, because they had no convoy of men of war.

The times appointed for these flotas to sail were, for that of New Spain in May, and that of the Terra Firma in August, both of them being ordered to sail with the first spring tides.

The galleons were appointed to be out in January, that they might coast along the Terra Firma, and arrive about April at Porto Bello, where, the fair over, they might take on board the plate, and be at the Havanna about mid June, where the New Spain fleet was to join them, that they might come the safer together to Spain; to which end, the vice-roy of Peru is to take care, that the plate be at Panama by the middle of March. The plate is fifteen days in carrying from Potosi to Arica; eight days generally from thence by sea to Callao, and twenty from Callao to Panama, taking in, by the way, the plate at Paita and Truxillo.

To prevent the fleet being detained by contrary winds, as has sometimes been the case, it was proposed by the court of Spain to fit out the galleons, in the river of Seville, in August and September, and then send them away to Cadiz, where they might go out with any wind, and need not wait for any spring-tides.

The reasons why it was judged absolutely necessary, that the flota from the Terra Firma should sail in September, were, because that was a safe season to ship off the goods; for, they coming to Porto Bello at a healthy season of the year, their merchandize was conveyed over to Panama at a cheaper rate, and with less danger of receiving damage. Moreover, by this means the merchants had leisure to sell their goods; the buyers had a fit season to travel to Peru with safety; and the armadas and flotas to return to Carthage and the Havanna, to get clear of the channel of Bahama, and to return to Spain in the best month for the seas. In fine, it is found by experience, that the month of September is, all circumstances

circumstances being duly weighed and considered, the fittest for the fleets to sail; and, although several accidents retard them till October or November, yet that season is fitter than March.

ARMADILLA, thus they call, in Spanish America, a small squadron, consisting commonly of six or eight men of war, from twenty-four to fifty guns, which the king of Spain keeps, for preventing foreigners from trading with the Spaniards or Indians, both in time of peace and war. This squadron has even power and orders to take all the Spanish trading vessels, which it meets on the coast, and which have no licence from the king of Spain. There is an *armadilla* both for the South and North Sea: the latter keeps commonly at Carthagena, and the former at Callao, which is the port of Lima, the capital of Peru.

ARMAGNAC, a province in France, is bounded by Languedoc on the east; by Agenois and Condomois on the north; by Gascony, properly so called, on the west; and by Comminges on the south. In this province they make brandy, which they send to Bayonne and Bourdeaux. They trade also in wool and flax. There is a mine of salt in the town of Laverdan, and, at Auch and Mauvesin, they make about eighty or a hundred quintals of salt. The country besides is fruitful in corn and wine.

ARMAMENT, a formidable body of forces, completely furnished with arms, &c. either for the sea or land service.

ARMAN, among farriers, a confection of great virtue in preventing a total loss of appetite. It consists principally of white bread, cinnamon, and honey of roses.

ARMARIUM *Unguentum*, weapon-salve. This ointment was formerly in great repute, and said to cure wounds at a distance, by dressing the weapon only; but, since the introduction of mechanics into physic, such ridiculous absurdities have been banished from the art of healing.

ARMENIA, called also *Turcomania*, a province or division of the Eastern Asiatic Turkey, is bounded on the south by Mesopotamia, on the north by Georgia, on the east by Persia, and on the west by Cappadocia and the Lesser Armenia, from which it is parted by the river Euphrates. Its extent is somewhat above two hundred miles, or from about 38 deg. 20 min. to almost 42 deg. of latitude; and from 39 to almost 42 deg. of east longitude, or about three hundred miles from east to west. The country is very healthy, the climate temperate, and the soil rich and fertile, especially in the midland vallies, but is much taken up with mountains, especially about the frontiers; yet these produce very good pasture, and the rest plenty of corn, wine, and fruits of all sorts. The people, at present mostly Christians, are robust, stout, and industrious; their lands are well cultivated, and several mechanic arts and manufactures are carried on by them to good advantage. The only misfortune is, they lie too much out of the way of trade, to reap all the benefit they otherwise would do, if more commodiously situated for it. However, they employ themselves in weaving of tapestry, and several sorts of stuffs, which they vend abroad: the rest follow agriculture; and one may see with pleasure a great difference between this Turkish province, and some others that appear poor, barren, and desolate for want of culture.

The Turkish inhabitants of this country, though inferior in number to the Christians, are possessed of some of the richest and fairest territories on each side of the Euphrates; but with this difference, that instead of being absolute masters, as they formerly were, they are now tributary to the Ottoman Porte, or rather enjoy a shadow of liberty under it; and hence proceeds their innate hatred against it; for they still adhere to their ancient way of leading a pastoral life in tents, and shifting their habitations. Being naturally addicted to plunder, they would do a deal of mischief to commerce, were it not for the care of the Turkish bashas to keep them in order; for as the tribute paid by the caravans, and the number of passengers, make the most considerable branch of their income, it is their interest to preserve the roads as free and safe as they can. In other respects they wink at many irregularities in their way of life, as their frequent inroads upon the Curdes, the Arabs, and other neigh-

bouring nations that own no subjection to the Porte. These Turks, a hardy race, excellent horsemen, courageous and enterprising, spread themselves likewise towards the east, even into Persia. They are computed all together to amount to about one hundred thousand families.

The name of Armenians is also given to those who were transported into several parts of Persia by Shah Abas; and more particularly to that celebrated colony of Armenians who dwell at Zulfa, one of the suburbs of Isfahan. These Armenians, and in general all those of the same denomination, who apply themselves to trade, which they make their chief business, are civil and polite, and have a great deal of good sense and honesty. They are not only, in a great measure, masters of the whole trade of the Levant, but have also a great share in that of the most considerable towns in Europe; for it is very common to meet with some Armenians at Leghorn and Venice, in England and in Holland; whilst on the other side they travel into the dominions of the Grand Mogul, Siam, Java, the Philippine islands, and over all the East, except China. It is not agreed among the learned, under what Abas, king of Persia, the colony of Zulfa was transported to Isfahan, and settled where it now is. But it is very certain, that Shah Abas the Great, in order to secure the conquest of Armenia, which he had taken from the Turks, removed into Persia the first Armenians who ever settled there; and about thirty thousand families of them were transported into the province of Ghilan only, from whence the finest Persian silks come. He also caused all the inhabitants of Zulfa, a large city of Armenia, to settle at Isfahan, whence the new Zulfa of Persia took its name. This Zulfa is now the center of all the commerce of the Armenians; and it is to the same Shah Abas these people owe their genius and capacity for trade, which did but very little appear till their transmigration into Persia. And as Abas the Great had no other view but to enrich his country, and was sensible he could not compass that design but by the means of trade, he cast his eyes upon silk, as the most precious commodity, and upon the Armenians, as the most proper people to dispose of it. In short, the Armenians, who were but husbandmen, were by him turned into merchants, and these merchants are become some of the most able and most celebrated traders in the world. When thus the trade of the Armenians was sufficiently established, the kings of Persia no longer meddled with it; the citizens of Zulfa alone continued to support it; and by the assistance of their brokers or agents, who are of the same nation with themselves, they distribute through the whole world the finest and richest commodities of Asia. These agents undertake, for a very moderate profit, to conduct the merchandizes to the very places they are designed for, to take care of them during the march of the caravans, to dispose of them to the best advantage they can, and to give afterwards a faithful account to those by whom they are intrusted. It cannot be sufficiently expressed how faithful those agents are, what care they take to preserve the merchandizes they conduct, not fearing even to run the danger of perishing themselves, in order to succour the camels, and other beasts of burden that carry them, at the crossing of rivers, or at the difficult passes of mountains. Their charity for each other is unspeakable; and, when those who are settled in some town are acquainted with the coming of a caravan, they do not scruple to undertake a journey of a day or two, in order to go and meet them, and carry refreshments to their brethren. When the caravans make any stay in towns, the Armenians, to live the cheaper, join several together. In Asia, they sell upon the road hard-wares of Venice, France, Germany, and England, in order to get provisions. In Europe they obtain them for musk and some spice. In a word, there is no nation comparable to them for sobriety, good husbandry and honesty. It is true, indeed, that when their affairs prove unprosperous in those foreign countries where they trade, they seldom return home, not daring, they say, to appear before their creditors, whose confidence they have abused. But it must be owned, that this happens very seldom, it being extremely uncommon to see an Armenian become a bankrupt.

rupt. There is nothing more extraordinary, and at the same time more pleasant, than the manner of striking bargains among the Armenians. They begin with putting money upon the table; after which, they cavil or dispute as much as they can about the price, the buyer and the seller presenting and repulsing alternately the pieces of money which they add to the price offered, or which they abate from the price demanded: this is always done with so much noise and ill humour, that one would think they are going to devour each other. All this, however, is nothing but grimace and affectation; and when the broker, who is always present at this comedy, judges that things are pretty near their value, he squeezes the seller's hand with so much violence, that he makes him cry out, but does not leave him till he accepts the buyer's offer. The farce ends with reciprocal jokes, each laughing on his side, thinking that he has the best of the bargain.

The principal towns in Armenia, which are populous and wealthy, are *Erzerum*, the capital, and *Tocat*. *Erzerum* has a very considerable trade, consisting chiefly in copper plates, dishes, &c. furs, galls, caviar, and madder. The English drive a great trade here, and have a consul, who lives in a very handsome manner.

Tocat is regarded as the center of trade for Asia Minor, where caravans are incessantly arriving or departing; those of Diarbeck are eighteen days coming here, and those from *Erzerum* but fifteen. Those from hence to Sinope are but six days going, and those from *Burfa* twenty. The caravans that go directly to *Smyrna*, without passing by *Angora* or *Burfa*, are twenty-seven days on the road, if with mules; but forty, if camels are the bearers: in fine, here are caravans that go only to *Angora*.

The great trade of this city consists in utensils of copper, as kettles, cups, candlesticks, and lanthorns, which the artisans here work very neatly, and these commodities are sent to Constantinople and Egypt; the copper they make use of comes from the mines of *Gumiscana*, three days journey from *Trebisond*, and from that at *Castamboul*, ten days travel from *Tocat* towards *Angora*.

Here is prepared a quantity of yellow Morocco leather, which is carried to *Samson* on the Black Sea, and from thence to *Calas*, a port of *Valachia*, where is also sent some red ones; but these the merchants of *Tocat* procure from *Diarbeck* and *Caramania*. Painted linens are also a great object of trade here; and though not so handsome as those of *Persia*, yet the *Muscovites* and *Crim Tartars*, for whom they are designed, are contented with them; and the commerce of silk is not inconsiderable here, though that of the growth of the place is all worked up here in slight silk stuffs, sewing silk, and buttons.

ARMENIAN Bole, is an earthy substance, of a pale yellowish colour, inclining somewhat to red. It is ponderous, pinguious, easily friable, and of a styptic taste. It is digged out of the mines in *Turkey*, and thence brought to us. At present, it is very rare with us; for what is found in the shops, approaching to the colour of red oker, is imported from *Spain* and *Normandy*, and is thought to be little different from the *rubrica sycopica*. It is an alexipharmic, and corrects those acidities in the blood which are prejudicial to health. It is astringent in some degree, and, for that reason, used in fluxions of humours. When applied externally, it is of a drying quality, and induces cicatrices on wounds. *Dale.*

ARMORINGS in a ship, are the same as waste cloaths, which are red cloaths hung about the outside of a ship fore and aft; there are also some hung round the tops, and these are called *top-armorings*.

ARMOISIN, a silk stuff, or kind of taffety, of an indifferent goodness, made at *Lions*, at several places in *Italy*, and in the *East-Indies*. There are *demi* or *half-armoisins* made at *Avignon*, which are of an inferior quality and less price than the others. They manufacture also *armoisins* with three threads. The *armoisin* of the *Indies* is slighter than those made in *Europe*, and of an inferior quality. Their colours, and particularly the crimson and red, are commonly false, and have little or no gloss or lustre.

There are two sorts of them, the *arains*, which are

taffeties, either striped or checkered; and the *damaras*, or flowered taffeties. Their length is from seven French ells to twenty-four, and their breadth from $\frac{7}{8}$ to $\frac{3}{4}$ of an ell.

The *Indian armoisins* have sold at *Amsterdam* from eighteen to twenty guilders per piece. When not bought of the company, that is, at second hand, one may stipulate to pay for them either in current or bank-money, or to deduct the difference.

The *armoisins* of *Lucca* have sold at *Amsterdam* from seven to nine sols de gros per ell. They who sell them again buy them by deducting the interest of the money for eighteen months, as not being obliged to pay for them till those months are expired; they also deduct one per cent. for prompt payment.

But, when they sell them to retailers, they deduct but two per cent. upon the whole for prompt payment; that is, they are allowed so much discount for the payment of ready money.

It must be observed that all the silks of *Italy* are sold after the same manner.

ARMONICAC, erroneously so written for *AMMONIAC*, which *see*.

ARMOUR, a strong defensive covering for the body. Armour, bandeliers, bridle-bits, halbert-heads and sharps, holsters, musquets, carbines, fowling-pieces, pistols, pike-heads, sword or rapier-blades, saddles, snaffles, stirrups, calve-skins dressed or undressed, geldings, oxen, sheep-skins dressed without the wool, and all sorts of manufactures made of leather, may be exported by any persons. 12 Car. II. cap. 4. sect. II. See *AMMUNITION*.

ARMOURER, he that makes arms. Of this trade there are very few in number; there are however some, who are employed in making skull-caps and breast-plates for our troops of horse: the company of this name is therefore united with the braziers. They commonly take about fifteen or twenty pounds with an apprentice. Their hours of working are from six to eight; and a journeyman has from fifteen to twenty shillings a week.

ARMOURY or *ARMORY*, a magazine or store-house, wherein arms and other warlike stores are deposited. See *ARSENAL*.

ARMS. Under the definition of arms, are comprehended not only all offensive and defensive weapons, but also all the warlike ammunition, which of all other merchandize that can possibly be taken into a ship, are the most hazardous, being more strictly contraband than any other article of commerce, the exportation, and clandestine importation, being strictly forbidden in all countries, and in many the exportation is attended not only with confiscation of ships and cargo, but with heavy fines and imprisonment: yet the Dutch are notorious for carrying on a contraband trade of this sort in time of war, equally furnishing their allies, and their secret enemies with warlike stores. Arms, ammunition, or gunpowder, may be prohibited to be exported at the king's pleasure, 12 Car. II. cap. 4. sect. 13. See *AMMUNITION*.

ARMY, a formidable number of soldiers completely armed, consisting of horse and foot, with artillery, ammunition, provisions, &c.

An army should be under the command of one general, having under him a lieutenant-general, a major-general, brigadiers, and other officers.

An army is composed of squadrons and battalions, and is generally divided into three corps, and formed into three lines. The first line is called the van-guard; the second, the main-body; and the third, the rear-guard, or body of reserve. The middle of each line is possessed by the foot; the right and left wings are composed of the cavalry; and sometimes squadrons of horse are placed in the intervals between the battalions. When the army is drawn up in order of battle, the horse are placed at five feet distance from each other, and the foot at three. But the file contracts in the shock, and its front lessens almost to one half. In each line, the battalions are at about a hundred and eighty feet distance from each other, which is nearly equal to their front, viz. three hundred feet. These intervals are left for the squadrons and battalions of the second line, to range themselves against the intervals of the first, that both may more readily march through these spaces to the enemy. The first line is usually

usually three hundred feet distant from the second, and the second six hundred from the third; that there may be sufficient room to rally, when the squadrons and battalions are broken. *Savin's Nouv. Ecol. Milit. pag. 266.*

ARNICA, *Lin. Gen. Plant. 784. Dorenicum. Baub. Pin. 184.* leopards-bane. There are three species of this plant; but that which is brought into England for medicinal purposes, grows naturally upon the Alps, and also upon many of the mountains in Germany, and other cold parts of Europe, and is greatly esteemed by the Germans for contusions and other medicinal qualities, among whom it is prescribed by this title of *arnica*. It is also ranged among the medicinal plants in many dispensaries, by the title given to it by Caspar Bauhin.

AROBÉ, or **ARROBE**, in Spanish *arroba*, and in the language of Peru *arroze*, is a weight used in Spain, Portugal, at Goa, and throughout all Spanish America. The Portuguese use it also in Brazil, where, as well as at Goa, it is sometimes called *arate*. All these *arobes* are scarce any other way like each other but in name, being very different in weight, and in their proportion to the weights of other countries.

The *arobe* of Madrid, and almost over all Spain, except Seville and Cadiz, weighs twenty-five Spanish pounds, which do not make quite twenty-three pounds and a quarter Paris weight; so that the common quintal, which is of four *arobes*, makes but ninety-three pounds Paris weight.

The *arobe* of Seville and Cadiz is also of twenty-five pounds, but these make twenty-six pounds and a half at Paris, Amsterd.m, Strasburgh, and Befançon, where the pound is equal; four *arobes* make the common quintal, that is, a hundred pounds; but there must be six *arobes* to make the quintal of Macho, which amounts to a hundred and fifty pounds Seville and Cadiz weights, which may be reduced to the Paris weight upon the foot of the reduction of the *arobe* of those two cities made above.

The *aroue*, or *arobe* of Peru, weighs twenty-five pounds French weight, and is chiefly used to weigh the herb Paraguay, of which the Spaniards and the Indians, who used it like tea, make so great a consumption, that there is wanted for Peru alone above seventy-five thousand *aroues* yearly. See **PARAGUAY**.

The *arate*, or Portuguese *arobe*, weighs much more than the Spanish, being thirty-two pounds of Lisbon, which amounts to near twenty-nine pounds Paris weight. An hundred pound, of England corresponds with ninety-one pounds eight ounces of Paris and Amsterdam, reckoning sixteen ounces to the English pound.

AROMATICS, all fragrant things in general, whether spices, herbs, flowers, seeds, or roots. It is remarkable that *aromatics* or spices preserve animal substances from putrefaction; and that providence has taken care to furnish warm climates with plenty of *aromatics*, which the inhabitants make frequent use of, and probably thereby check that spontaneous tendency to putrefaction, to which the heat inclines them.

AROMATITIS, in natural history, a bituminous substance, in colour and smell resembling myrrh, whence it derives its name; it is found in Arabia and Egypt. *Gorraus.*

AROUÉ. See **AROBÉ**.

AROUGHCAIN, an animal found in Virginia, which intirely resembles the beaver, except that it feeds and leaps upon trees like the squirrel. The English value its fur pretty much, which makes a branch of their trade with the Indians who live near their colony.

AROURA, in antiquity, a Grecian measure consisting of 5000 square Grecian feet, being half the plethron, and equal to 5073 English square feet, and 1825 decimal parts. The Egyptian *aroura* was equal to 10,000 square cubits, or 332 English square feet, and 76 decimal parts. *Arbutnot.*

ARPEN, or **ARPENT**, an acre or furlong of ground; the most ordinary one called *l'arpent de France* is one hundred perches square, after twenty-two feet to the perch by the king's ordonnance of August the 13th, 1669. Some account it but half an acre. This word is often used in *Domesday*, where *arpen* seems to be some quantity

less than an acre. Hence *arpentator* is used for a measurer of lands. *Cowell. edit. 1727. See ACRE.*

ARQUEBUSE, or **HARQUEBUSE**, a fire-arm, of the same length with a fusée, or musquet, which is commonly cocked with a spring-lock. This kind of arms was formerly very much used both in war and for hunting; but, at present it is hardly any otherwise used than for the defence of besieged places.

ARQUIFOUX. See **ALQUIFOUX**.

ARRAC, or **RAC**, is an excellent spirituous liquor, which the English get from Batavia or Ma'acca to make punch. The Chinese are those whose make *arrac* in the Indies by distillation, and this of three sorts, extracted, the one from the cocoa-tree, the second from rice, and the third from sugar. The first is the best, and most in use. They make it of the liquor which issues from the blossom-bunch of the cocoa-tree. For which purpose they tie the bunch, whilst still wrapped up within its membrane, with a piece of packthread, and then with a knife they make a cross-cut in that bunch, a little above the place where it is tied, and adapt a pitcher to it, to receive the liquor, which is vinous, palatable, and sweet. It is called *tonac*, or *fouri*. Others use a bamboe-cane instead of a pitcher. Having thus drawn the liquor, they let it ferment, and afterwards distil it to make *arrac*. They have a prodigious demand for it all over the East-Indies.

The Dutch also import some into Holland. It is something sweeter, and less intoxicating than common brandy; for which reason the English think it more fit to make punch.

The nature and composition of this celebrated liquor has been much controverted. Mr. Lockyer tells us, that the name of *arrac* is an Indian word for strong waters of all kinds; for they call all our spirits and brandy, English *arrac*. But what we understand by the name *arrac*, is really no other than a spirit procured by distillation from a vegetable juice called *toddy*, which flows by incision out of the cocoa-nut tree, like the birch-juice procured amongst us.

The *toddy*, adds Mr. Lockyer, is a pleasant drink by itself, when new, and purges those who are not used to it; and when stale, it is heady, and makes good vinegar. The English at Madras use it as leven to raise their bread with.

Goa and Batavia are the chief places for *arrac*. At Goa there are divers kinds; single, double, and treble distilled. The double distilled, the sort which is commonly sent abroad, is but a weak spirit in comparison to Batavia *arrac*; yet, on account of its peculiar and agreeable flavour, it is preferred to all other *arraes* of India. This is attributed to the earthen vessels they use at Goa to draw the spirit, whereas at Batavia they use copper stills.

The Parier *arrac* made at Madras, and the Columbo and Quilone *arrac* at other places, being fiery hot spirits, are but little valued by the Europeans, and therefore seldom imported, though highly prized among the natives.

Arrac is likewise a kind of spirituous liquor or brandy, made by the Tartars of Tungusia, subject to the czar of Muscovy, from mare's milk, which is left to sour, and is afterwards distilled twice or thrice, between two earthen pots closely stopped, whence the liquor runs through a small wooden pipe. This liquor is very strong, and intoxicates more than brandy distilled from wine.

Arrac, rum, brandy, spirits or strong waters, or other excisable liquors, coffee, tea, cocoa-nuts, chocolate, and cocoa-paste, on board a ship within the limits of any port of Great-Britain, or found unshipping or unshipped before entry, may be searched for and seized, together with the package, by the officers of excise, in like manner as by the officers of the customs. 11 Geo. I. cap. 30. sect. 1.

Arrac, brandy, rum, spirits or strong waters, foreign, upon an excise-officer's oath of suspicion of concealment, made before the commissioners, or a justice of the peace, they may empower him to enter such suspected places, and seize the liquors, with the casks, &c. Officers obstructed, the penalty 100l. 11 Geo. I. cap. 3. sect. 2.

Arrac, whether British or foreign, not to be sold but in warehouses, &c. entered as directed by 6 Geo. I.

cap. 21. upon forfeiture, and the casks, &c. 11 Geo. I. cap. 30. *sect.* 10.

Arrac, brandy, rum, spirits or strong waters, coffee, tea, and cocoa-nuts; permits granted for the removal, not returned, or the goods sent away within the time limited, the penalty treble the value. 11 Geo. I. cap. 30. *sect.* 10.

Permits not returned, and the decrease not found to be sufficient, the like quantity forfeited. 11 Geo. I. cap. 30. *sect.* 10.

Permits not to be taken out by direction in writing of the proprietor of the stock, or his known servant; upon forfeiture of fifty pounds, or three months imprisonment. 11 Geo. I. cap. 30. *sect.* 10.

Arrac, brandy, rum, or other spirits, or tea offered to sale by any person without a permit, or by any hawker, pedlar, &c. with a permit; the person to whom it is offered may seize and carry it to the next warehouse, belonging to the customs or excise, and bring the person offering the same before any justice of the peace, to be committed to prison, and prosecuted for the penalties incurred for such offence. 9 Geo. II. cap. 35. *sect.* 20. The person seizing such goods may prosecute in his own name, and on recovery, is intitled to a third part of the gross produce of the sale. And the commissioners are, if desired, upon a certificate from the justice of the offenders being committed to prison, to advance to the seizer 1s. per lb. for the tea, and 1s. per gallon of brandy so seized.

Arrac, &c. foreign brandy, rum, or other spirits in casks under sixty gallons, (except for the use of the seamen two gallons each) or six pounds of tea found in any ship, or vessel arrived from foreign ports, at anchor hovering within the limits of any port, or within two leagues of the shore, and not proceeding on her voyage (unless in case of unavoidable necessity and distress of weather, notice whereof must be given to the collector, or chief officer of the port, upon the ship's arrival) is forfeited, with the boxes, casks, and other package, or the value thereof. 9 Geo. II. cap. 35. *sect.* 22.

No brandy, *arrac*, rum, geneva, strong waters, or other spirits whatsoever, brought into Great-Britain, in any cask which doth not contain at least sixty gallons of such liquors respectively, shall be reported for exportation, or exported to foreign parts. 28 Geo. II. cap. 21. *sect.* 1.

Arrac, imported from any of his Majesty's colonies in the East-Indies, is, by 7 Geo. II. cap. 14. *sect.* 1. to pay the same subsidies, duties, and excise, as brandy and other foreign spirits, and the like allowance is to be made on exportation. See BRANDY.

ARRAGON, in Spain, is the next kingdom in dignity to that of Navarre. It is bounded on the north by the Pyrenees, which divide it from France; on the west it has Navarre, and New and Old Castile; on the south the kingdom of Valencia; and on the east, part of Valencia, and the principality of Catalonia.

The country is mountainous, but full of delightful vales, and extraordinary fertile, which produce great plenty of wheat, wine, oil, saffron, and fruits of the most delicious kind. They breed also great numbers of cattle, and abound with all sorts of fowl, both wild and tame.

The mountains are said to have mines of gold, silver, and other metals, but little is made of any of them, except iron. Here are likewise very considerable rivers, and plenty of good fish; the most remarkable river is the Turio, which fertilizes a great part of the country, not by an overflow like that of the Nile, but by its slow and gentle course, which gives opportunity to the husbandman and gardener to cut channels from it to water their lands; inasmuch that we are told, their trees bear fruit three, and often four times in the year; and not only in great plenty, but in such variety, that they reckon no less than four hundred sorts produced in this kingdom. Their orchards, gardens, and pasture-grounds, are likewise much admired for their continual verdure and fertility.

Zaragoza, or Saragossa, is the metropolis of this kingdom, and is rich and populous, and carries on a great commerce, and a considerable number of trades and

manufactures, both within and without the walls.

Terrazana is another city in this kingdom, which carries on a considerable trade, much in the same way as Saragossa does.

Val de Tena, or *Sallent*, is a remarkable town in the very heart of the Pyrenees. Here is a large traffic carried on in the produce of the country all the summer, though the great quantities of snow which cover these mountains, make the country impassable near six months in the year. Their trade is occasioned by two passes leading into France, the one on the west, over the river Gallego, towards Beam in Gascony, and the other on the east over a cleft of the mountain Forqueta.

ARREARS, or ARREARAGES, is taken for money unpaid at the due time, as rent behind; the remainder due on an account, or of a sum of money remaining in the hands of an accountant: it likewise signifies what remains unpaid of pensions, taxes, or any other money payable yearly, or at a fixed term.

ARREST, signifies a restraint of a man's person, depriving him of his own will and liberty, and binding him to become obedient to the will of the law; and it may be called the beginning of imprisonment. Cowell.

An *arrest*, in a civil case, is the apprehending or restraining one's person by process, in execution of the command of some court, or officer of justice. Wood's *Inft.* 575.

Magna Charta, cap. 29. None shall be taken, imprisoned, or disseized of his freehold, but by judgment of his peers, or according to the law of the land.

Seamen in the king's service are privileged from *arrests* for debts under twenty pounds. 1 Geo. II. cap. 14. *sect.* 15. 14 Geo. II. cap. 38. *sect.* 3.

Soldiers or marines not liable to *arrests* for a debt of less than ten pounds. 30 Geo. II. cap. 6. *sect.* 64. 30 Geo. II. cap. 11. *sect.* 37.

Peers of the realm, and members of Parliament may not be *arrested*, unless it be in criminal cases; but the process against them is to be summons, distress infinite, &c. 12 Will. III. cap. 3.

An *arrest* may be by night or day. 9 Rep. 66. except on the Lord's day, and then even an *arrest* will hold good in cases of treason, felony, or breach of the peace. Stat. 29 Car. II. cap. 7.

Corporations and companies must be made to appear by *distringas*, and cannot be *arrested*. Finch 353. 3 Salk. 46.

Persons attending upon any courts of record, on business there, are to be free from *arrests*. 3 *Inft.* 141.

The king cannot command any one by word of mouth to be *arrested*; but he must do it by writ, or order of his courts, according to law: nor may the king *arrest* any man for suspicion of treason, or felony, as his subjects may; because if he doth wrong, the party cannot have action against him. 2 *Inft.* 186.

The person of a bankrupt is not liable to *arrest* for debt, or escape-warrant, in going to, staying with, or coming from the commissioners or assignees, if he attend in obedience to any notice or summons from them; but on producing such notice or summons, he shall be discharged. And if, after such summons shewn, any officer shall detain such bankrupt, he shall forfeit five pounds *per diem* for the bankrupt's use. Stat. 5 Geo. II. cap. 30. *sect.* 5.

ARRESTO *facto super bonis mercatorum alienigenorum*, a writ which lies for a denizen against the goods of aliens found within this kingdom, in recompence of goods taken from him in a foreign country, after denial of restitution. Reg. Orig. 129. This the ancient civilains called *clarigatio*; but by the moderns it is termed *reprehensio*. Cowell.

ARSCHEIN, a long measure, used in China to measure stuffs. It is of the same length with the Dutch ell, which is of two feet eleven lines, and amounts to $\frac{3}{4}$ of a French ell. So that seven *arscheins* of China make four ells of France.

The ell of Amsterdam makes $\frac{3}{4}$ of a yard of London, so that four ells of Amsterdam, or four *arscheins* of China, make three yards of London. To reduce the *arscheins* to the yard of London, you must say, If four *arscheins* make three yards, so many *arscheins* (thirty for instance) how many yards will they make? Answer 22 $\frac{1}{2}$. And, in order to reduce the yards into *arscheins*, say, if three yards make

make four *arschins*, so many yards (as thirty-five for instance) how many *arschins* will they make? *Answer*, 46 $\frac{2}{3}$.

ARSENAL, a place where all kinds of warlike stores are kept in fortified towns.

ARSENIC, a metallic sulphur, is of three sorts, *white*, *yellow*, and *red*. The *white* is a ponderous, hard, compact, solid, transparent, glassy substance, procured by subliming flowers of *cobalt* from a certain portion of pot-ashes. Henckel relates, *Pyritolog. oder Keils-historie, das zehnte capitel*, p. 602, that it is sometimes, though exceeding rarely, found native in the earth, pure, clean, and of a snowy whiteness.

White arsenic exposed to the air, changes its transparency for an opaque milky colour. It is not inflammable; but intirely evaporates in the fire, in a white smoke, smelling like garlick. Dr. Mead observes in his *Mechanical Account of Poisons*, that *white arsenic* is totally soluble in water; if one part of it be sufficiently boiled in fifteen parts of distilled or rain water, that it gives, upon evaporation, salts of triangular planes, which unite into octoedral crystals; and that in these either beat to powder, or dissolved by boiling, metallic globules, resembling those of quicksilver, are plainly discoverable by the microscope.

Yellow arsenic is prepared by subliming *white arsenic*, with the addition of a tenth part of sulphur. This is splendid, but not so transparent as the white, and not unlike a metallic yellow glass.

The *red arsenic* differs from the yellow only in this respect, a greater quantity of sulphur is added, together with a particular kind of red cobalt, called *kupfer-nickel*.

Orpiment, a species of *arsenic*, is a mineral substance, composed of small scales or leaves, like talk, said by some to be found in the mines of gold, silver, and copper; by others in particular mines and veins in Greece and Hungary, unmixed with any other mineral. It is of three different colours, of a bright, shining, golden colour, a vermilion red, intermixed with a deep yellow, and a green with a whitish yellow. *Orpiment* exposed to the fire in an open vessel, melts and emits a flame, not so blue as that of brimstone. As soon as it is melted, it appears of a deep red colour; and when poured out into a thin plate and cold, does not ill resemble, in colour and transparency, a garnet; this is the *sandaracha Græcorum*, Hoff. *Observat. Chymico Phys. lib. iii. obs. 1*. Kept in the fire for some time, it evaporates: the purer sorts scarce leave any perceptible feces. Sublimed in a glass vessel, some whitish flowers first arise, which are soon followed by others of a deep yellow, inclining to an orange-colour; and at length by red flowers, which not rising so high as the others, are melted, by the nearness of the fire, into a transparent red substance like that above-mentioned. Geoffroy relates, *Mat. Med. tom. i. p. 185*, that the taste of *orpiment* is acrimonious; but it did not appear so to Dr. Lewis upon trial; and Hoffman says expressly it has no taste. *Orpiment* has (as the last-mentioned author rightly observes) for a long time been reckoned in the class of poisonous minerals, and looked upon as a species of *arsenic*; although in its crude form it does not seem to contain any thing of virulency. It has been given to dogs in a considerable quantity, without proving either emetic or purgative, or producing any of those fatal effects which are usually attributed to it: but after it has undergone the action of fire, it really acquires a caustic and poisonous quality.

Orpiment and *yellow arsenic* having been looked upon as the same thing, the poisonous quality of the latter has been oftentimes attributed to the former. The celebrated author above-quoted compares *orpiment* to antimony, which taken in its crude and native form, has no virulent effect; but which, as soon as it is stript, by fire, of its sulphureous covering, becomes a most violent emetic, &c. In the same manner, says Hoffman, *orpiment* may be taken crude, without any harm; but it is far from being harmless, when its parts have been once separated by fire.

Arsenic serves to make *zaffera*, used by potters in giving a blue colour to their vessels; and the *encaustum caruleum*, or that kind of blue sometimes used by painters, and often by women to mix with their starch, for whitening and stiffening linen.

Arsenic is a powerful corrosive, and reckoned among the strongest poisons.

ARSON, is *house-burning*, which is felony at common law. 3 *Inst.* 66. It must be maliciously and voluntarily, and an actual burning; not putting fire only into a house, or any part of it, without burning; but if part of the house is burnt; or if the fire doth burn, and then goeth out of itself, it is felony. 2 *Inst.* 188. H. P. C. 85. The burning of a frame of a house, is not accounted house-burning, because the frame of a house cannot come under the word *domus*, which is necessary in every indictment for *arson*; and it must be the house of another; for if a man burns his own house only, though with intention to burn others, it is not felony, but a great misdemeanour, punishable with fine, pillory, &c. If a house is fired by negligence or mischance, it cannot amount to *arson*. 3 *Inst.* 67. H. P. C. 85. where one burns the house of another, if it be not wilful and malicious, it is no felony, but only trespass: therefore if A shoot unlawfully in a gun, at the cattle or poultry of B, and by means thereof sets another's house on fire, this is not *arson*; for though the act he was doing was unlawful, yet he had no intent to burn the house. 1 *Hale's Hist.* P. C. 569. By *stat. 25 Hen. VIII. cap. 11.* burning of houses or barns wherein any corn is, is felony without benefit of clergy. And the *stat. 22 and 23 Car. II. cap. 7.* makes it felony to set barns, stables, stacks of corn, hay, &c. on fire in the night-time, or any out-houses or buildings; but the offender may be transported for seven years. By 6 *Ann. cap. 31.* servants through negligence or carelessness setting on fire any dwelling-house or out-house, shall forfeit 100*l.* to be levied by warrant of two justices, and paid to the churchwardens of the parish, to be distributed to the sufferers by the fire; or on default shall be sent to the house of correction, and there kept at hard labour eighteen months, &c. By 9 *Geo. I. cap. 22.* (made perpetual by 31 *Geo. II. cap. 24.*) setting fire to any house, barn, or out-house, or to any hovel, cockmow, or stack of corn, straw, or wood, is made felony without benefit of clergy. See BURNING.

ARSURA, the trial of money by fire after it was coined. In *Domesday* we read, *reddit 50*l.* ad arsuram*, which is meant of lawful and approved money, whose alloy was tried by fire. *Cowell. ed. 1727.*

ART, a system of rules, which, being carefully observed, render our undertakings successful, advantageous, and agreeable. *Arts* are divided into *liberal* and *mechanical*.

Liberal Arts, are those which are cultivated by the ingenious, without any regard to lucre arising therefrom. — As poetry, music, painting, rhetoric, navigation, &c.

Mechanical Arts, are those which require labour, and depend more upon the hand than the mind; and which are cultivated chiefly for the profits which result from them. These are more generally known by the name of *trades*.

ARTEMISIA, *Mugwort*, so called according to some, from *Artemisia*, wife of Mausolus, king of Caria, who brought this plant into use, and adopted it as hers; whereas, before, it was called *Parthenis*, the virgin goddess being feigned to have given that name to it, because good for the diseases of women.

The *moxa*, so famous in the eastern countries for curing the gout, by burning it on the part affected, is the *lanugo*, or down, which is on the under part of the leaves, of a sort of mugwort, supposed to be different from our common sort; but the dried samples, which have been brought to England, appear to differ in nothing but the size of the plant, that being much less; and it may well be supposed, that the soft down of the common sort, or of any other plant, will answer the purpose full as well.

ARTICLE, a small part of an account contained in the journal, invoice, &c. Thus it is said, such an account contains so many articles of debtor, and so many of creditor. The memorial, the invoice of the merchandizes I have sent you contains so many articles, which amount to so much.

An able book-keeper ought to be very exact in posting into the ledger, to every one's account, either as debtor or creditor, every article that has been set down in the journals and cash-book, &c.

ARTICLE is also said of the clauses, terms, and conditions, agreed upon in partnerships, bargains, and treaties, and also of the things adjudged or determined by arbitrators. In this sense, they say, it is agreed by such an article of our partnership, that the house-rent shall be paid out of the common stock. In the bargain we have made together there is an article, by which you are bound to such a thing. This is according to an article of our treaty. Our arbitrators have determined such an article in my favour.

ARTICLES between a captain of a privateer and his crew. [The following are such articles of agreement as were commonly entered into by the captains of privateers in the late war and their crews, which we publish as a copy for our readers to have recourse to, in case any future rupture should render it useful.]

Articles agreed between captain A. B. commander of the private man of war, called the *Terrible* (with twenty guns mounted, carrying nine pound shot, twenty brass pateraroes, four mortars, and some wall pieces, manned with two hundred men, now lying at Church-hole, designed to cruise against the French and Spaniards) on the one part, and the said ship's crew on the other, witnesseth,

1. That the said captain A. B. for himself, and in behalf of the owners of the said ship *Terrible*, shall put on board her, great guns, swivels, powder, shot, and all other warlike ammunition necessary for them; as also small arms, and provisions sufficient for the said ship's company for a six months cruise at sea, from their sailing from the Downs; in consideration of which, the owners, or their assigns, shall be reimbursed (out of the first prize or prizes taken by the said ship *Terrible*, before any dividend is made thereof) the whole charge of warlike stores (great guns and small arms excepted) victualing, advance-money, and the expenses the owners are at for the surgeon's chest, and a set of musick; after which one half of the net proceeds of such prize or prizes as shall be taken, to be for the account of the owners, and at the disposition of the managers; and the other half of such net proceeds to the sole property of the ship's company; the captain's share of which to be fix (in some eight) *per cent.* and the residue to be divided in the proportions mentioned in the eleventh article of these presents.

2. That for preserving a decorum on board the said private man of war, no man is to quit, or go out of her, on board of any other vessel or vessels, or on shore, without leave obtained of the commanding officer on board, under the penalty of such punishments as shall be esteemed proper by the captain and officers.

3. That it shall be intirely in the captain's power to cruise where he shall esteem most beneficial, for the interest of the owners, and ship's company. (*In some it is, to cruise where the managers, and in others, where the owners shall direct.*)

4. That if any person be found a ringleader of mutiny, or causing a disturbance on board, refuse to obey the command of the captain and officers, behave with cowardice, or get drunk in time of action, he or they shall forfeit his or their share, to be divided amongst the ship's company; and be otherwise punished according to law.

5. That all cloaths, bedding, watches, and rings in wear, buttons, buckles, and what else is deemed small plunder by custom, is to be divided amongst the ship's company, according to their several stations, the captain not to interfere with them; the cabin utensils in present used for the commander.

6. If any person shall steal, or convert to his own use, any part of the prize or prizes, or be found pilfering any money or goods, and be convicted thereof, he shall forfeit his share to the ship and company.

7. The captain has the power of taking out of any prize or prizes, whatever stores he may judge necessary for the ship *Terrible*, without paying for them; provided the prize is not disabled thereby.

8. That whosoever first spies a sail, which proves to be a prize, shall have seven pounds, (*in some only one guinea, in others five*) and the first man proved to board a prize before the strikes, shall have a gratuity of ten

pounds, (*in some ten, and in others fifteen guineas*) for his bravery, to be deducted out of the gross sum of the prize.

9. That if any private man shall lose a leg, arm, or eyes, in time of action, or in the ship's service, he shall, besides the advantage of Greenwich hospital, have a gratuity of twenty-five pounds, and in proportion to the officers, exclusive of shares, (*in others only twenty pounds to a private man, fifty pounds to the captain, forty pounds to the first lieutenant, and thirty pounds to each of the other lieutenants, master, and surgeon*) the said sums to be deducted out of the gross sum of the prize; and in case of mortality under cure, the said gratuity and shares to be made good to their assigns.

10. That for the farther encouragement of the said private man of war's company, it is agreed, that the chief officers shall have six guineas, the petty officers and able seamen five guineas, able-bodied landmen three guineas, and boys one guinea, advanced to them in the *Hope*, (*in some, the officers and seamen have only five guineas, and the landmen two.*)

11. That the half of the net proceeds of all prizes, taken by the ship *Terrible*, which is appropriated to the ship's company, be divided amongst them in the manner following, after the captain's fix or eight *per cent.* (*as shall be agreed*) is taken thereout, as above.

When the captain has not the above-mentioned fix or eight *per cent.* but divides with the ship's company, he commonly has twelve shares, as follows, viz.

Shares.		Shares.	
The captain	12	The armourer	1½
The first lieut.	5½ to 6	The midshipmen,	
The second lieut.	4½ to 6	to each	1½ to 2
The third lieut.	3½ to 5	The quarter-masters, to	
The master	3½ to 5	each	1½
The first mate	3 to 4	The quarter-gun-	
The second mate	2½ to 2	ners, to each	1¼ to 1½
The surgeon	3 to 4	The corporals, to	
The surgeon's mate	2½ to 2	each	1¼ to 1½
The lieut. of ma-		The sail-maker	1½
rines	3 to 4	The yeoman of the pow-	
The Gunner	3	der-room	2
The gunner's mates, to		The ship's steward	2
each	2	The captain's ditto	1½
The carpenter	3	The master of languages	1½
The carpenter's mates,		The captain's clerk	2
to each	2	The ship's cook	1½ to 2
The boatwain	3	The captain's ditto	1½
The boatwain's mates,		The able seamen,	
to each	2	to each	1½ to 1
The purser	3	The able landmen, to	
The cooper	1½ to 2	each	¾ to 1
The music, to each of		The sea-boys, to each ½ or ¾	
them	2	The land-boys, to	
The caulker	2	each	½ to ¾
The master at arms	1½ to 2		

12. That on the death of the captain, the command to devolve on the next officer, and so in rotation; and for the encouragement of the able seamen and others, on the loss of officers, they are to be replaced out of the ship's company, according to their gallant behaviour, as the captain shall appoint.

13. That whoever deserts the said ship *Terrible*, within the time here under-mentioned, shall forfeit his prize-money to the owners and company, to enable them to procure others in their room.

14. All and every one on board do covenant and agree to serve on board the said ship *Terrible*, the term of six months, beginning at the said ship's departure from the Downs.

15. And lastly, for the true performance of all, and every the afore-mentioned covenants and agreements; each, and every of the said parties, do bind themselves, their heirs, executors, and administrators, in the penal sum of five hundred pounds, lawful money of Great-Britain, firmly by these presents: in witness whereof, the said parties to these presents have severally set their hands and seals, the day of _____ in the year of our Lord _____ and _____ year of the reign of our sovereign lord king _____

See PRIVATEERS.

ARTI-

ARTICLES, *before marriage, their validity in case of bankruptcy.* Marriage bonds are frequently given before the espousals, by persons who are engaged in trade or business, and where it would be inconvenient to lay out the portion in land, because the woman's fortune is supposed to be added to the husband's, and to be invested in the stock in trade, in order to be there managed by the husband for the mutual support of themselves and their children.

And these bonds must be given to two trustees, to be named and appointed by the intended wife, or one of them by her, and the other by the man, and according to the portion or fortune, which the woman brings her husband, the husband binds his heirs, executors, and administrators, within a certain time after his decease, to pay the trustees, or the survivor of them, or the executors or administrators of such survivor, the sum agreed upon between them in trust, and for the sole use and benefit of the wife, in case she shall survive him; or part for the wife, and part for the children, as the parties shall agree between themselves; and in case the wife shall not survive the husband, and there shall be no children, then the bond is usually declared to be void.

The reason of giving this bond to trustees, is in order to support the demand against the estate of the husband; and it is effectual against his real, as well as personal estate; but it must not be made to the intended wife in her name, before marriage, because upon the marriage, the husband and wife are become one person in law, and whatever securities might be given to her before marriage, unless they were supported by trustees, would, on such marriage, revert back again, and be merged in the husband's fortune, and be unsafe for the wife.

A marriage-bond is of no greater effect and force than any other bond-debt; but as the wife is frequently executrix to her husband, and the law usually throws the right of administration upon her, whenever she is either executrix or administratrix, she, as well as any other executor or administrator, has a right to pay her bond-debt first, and preferable to all other bond debts, or debts of an equal or inferior degree.

But if the husband becomes bankrupt in her life-time, this has been adjudged to be such a contingent or uncertain debt, that her trustees cannot come in as creditors to prove such debt under such commission, which the following cases will illustrate.

A husband who was a trader (in consideration of a marriage, and of a portion) gave a bond to his wife's trustees, to leave the wife (if she survived him) a thousand pounds. The obligor became a bankrupt; and it was objected, that in Lord Cowper's time, it had been ordered, in case of bond given on so valuable a consideration, that the money computed upon the distribution to be the share of the obligee in this bond, should be put out at interest, and the creditors have such interest during the life of the husband, the bankrupt; and if the husband should die, leaving the wife, the money to be paid to the wife; but if the wife should die in the life-time of her husband, then the money to be paid to the creditors. 2 Vern. 662. *Holland a Calliford*.

On the other hand, Lord Macclesfield was said to have doubted of this; wherefore this case coming in question before lord-chancellor King, his lordship ordered the precedents made in Lord Cowper's time to be left with him. *Ex parte Bayly in Hil. Vac. 1720. 2 Peer Will. 497. Mich. T. 1728.*

And his lordship [King] was of another opinion, conceiving, that no part of the bankrupt's estate should wait, or be deferred from being distributed; the act ordering, that the bankrupts estate should be distributed within months; especially that the distribution should not wait, as in the present case, for a debt, which was neither *debitum in presenti*, and never might be *debitum in futuro*, in regard the wife might die in the life-time of her husband; besides the husband, after his certificate allowed, might go to his trade again, and become a solvent person, able to pay off his bond. The court resolved, that the contingent creditor should not come in for a distribution, neither should the money be reserved in favour of such contingency.

But his lordship declared, that though the debt was

contingent when the obligor became a bankrupt, yet if the contingency happen before the distribution made, then such contingent creditor should come in for his debt; so if such contingency happened before the second dividend made, the creditor should come in for his proportion thereof, though after the first dividend.

The obligor on a bottomree-bond became bankrupt before the return of the ship, and the ship did not return before the distribution made; whereupon it was held that the obligee should have no benefit of the distribution upon the commission. And,

Whereas it was objected, that this bond would be barred, after the bankrupt's certificate allowed, which could not be unless it was then done.

Per curiam: this cannot be, if the obligor is careful in declaring upon his bond; indeed if the party declares upon the bond only, he shall be barred; otherwise, if he sets forth as well the condition as the bond in the declaration; for then it must appear, that the cause of action did not accrue at the time of the obligor's becoming a bankrupt. *Note*, the cautious way of declaring in such case.

But the above case is since altered, and the obligee in any bottomree-bond shall be admitted to claim, and after the loss or contingency shall have happened, to prove his debt and demands in respect of such bond, in like manner as if the loss had happened before the time of the issuing of the commission of bankruptcy against the obligor, and shall be entitled unto, and have and receive a proportionable part, share, and dividend of the bankrupt's estate, in proportion to the other creditors of such bankrupt, and in like manner as if such loss and contingency had happened before such commission issued. 19 Geo. II.

And this act makes it the same with the obligors and obligees on a policy of insurance.

One Blanchard, a cabinet-maker, married the sister of Calliford, who had five hundred pounds portion secured by land. Blanchard, on his marriage, gives a bond to leave his intended wife, if she survived him, five hundred pounds, or a third of his estate, at her election.

Blanchard became a bankrupt; bill by the assignees to have the five hundred pounds raised by the sale; and decreed accordingly; but with this, that the wife should come in as a creditor upon the five hundred pound bond, and what should be paid in respect thereof, to be put out at interest and received by the creditors, during the life of the husband, and if the wife survived, then the money to be paid her. *Blanchard a Calliford*.

J. S. indebted by bond to the wife of A, became a bankrupt; the husband comes in and claims the debt, pays the contribution money, but dies before any dividend was made; the wife survives, but dies also before any distribution.

Lord-chancellor directed the distribution to be made to the executors of the wife, and not to those of the husband; repaying to the husband's executors what he had advanced for contribution.

The husband's paying the contribution money did not alter the property of the debt, but it remained a chose in action, and survived to the wife. *Mich. 1719. 2 Vern. 707.*

The plaintiff, James Tully, brought an action of debt against the defendants, Frances Sparkes and Christopher May, executors of William Donalson, for eight hundred pounds, wherein the plaintiff declared, that William Donalson in his life-time, viz. the 6th of May, 1704, by his bond then dated, obliged himself, his heirs, &c. to the plaintiff, Tully, and one Philip Rudsbj, whom the plaintiff survived, in the said sum of eight hundred pounds, &c. with condition, that the heirs, &c. of the said William should pay to the said plaintiff, Tully, and Philip, and the survivor of them, or the executors, &c. of the survivor of them, four hundred pounds within two months after the death of the said William, in case one Martha Latimer should marry the said William, and should happen to survive him; in trust for the benefit and behoof of the said Martha, her executors, &c. then the obligation should be void, &c. and the plaintiff in fact says, that after the making the said bond, the said Martha married the said William Donalson, and that after the said marriage, the said Philip Rudsbj died, and the plaintiff survived him; and that the said William

made his will, and the defendants his executors; and afterwards (the said will not being revoked) died; and the said Martha survived him, and is yet alive; and that after the death of the said William Donalson, the defendant Frances proved the said will in due form of law; that the said Frances and Christopher, or either of them, did not pay to the plaintiff the said four hundred pounds within two months after the death of the said William, according to the said condition, whereby the bond became forfeited; and the action arose to the plaintiff, to demand of the said defendants the said eight hundred pounds; but the defendants the said eight hundred pounds, though often requested, have not yet paid, &c.

The defendants, after praying oyer of the bond and condition (which was granted) plead in bar, that the said William Donalson, after making the bond, for seven years, before and after that time, exercised the trade of a biscuit-baker, and got his living thereby, and became indebted to sundries in the sum of two hundred pounds and more, and became a bankrupt, and was declared such by the commissioners, and had his certificate allowed.

This case was learnedly argued both for the plaintiff and defendant, and the cause coming on in Michaelmas term, 1728, judgment was given by the whole court, upon the merits, that the plaintiff's debt was not barred by the matter compromised in the plea, because it was not within the 7 *Geo. II. cap. 31.*

In the matter of James King, a bankrupt, on the part of Anne King, his wife. The said Anne King, by her petition in January, 1742, set forth, that on the 16th of February, 1731, by articles tripartite made before her marriage with James King, between James King the elder, and the bankrupt, of the first part, James Sutton, and the said Anne King, by the name of Anne Sutton, his daughter, of the second part; and Robert Sutton and John Complin, of the third part; reciting the intended marriage: it was, amongst other things, covenanted and agreed, that the same James Sutton should, within three months after the marriage, pay the said James King the younger a thousand pounds as her marriage portion; and if James and Anne should have issue living at the death of James Sutton, that then his heirs, &c. would pay to the said James King the younger, the further sum of a thousand pounds, if he should be then living; but if King should die before the last thousand pounds became payable to him, then the same should in like manner be paid to the said Robert Sutton and John Complin, &c. in trust, to place out the same at interest, on such securities as the trustees, with the said Anne King, should approve of, and should pay the interest to be made thereof to her, during her life; and after her decease, for the maintenance and education of the children of the said James and Anne King, till they should attain twenty-one, and then to be paid to them in such parts and proportion as the said James and Anne King should appoint; and for default of such appointment, to be divided equally between them.

And in case they had no issue, then to such person or persons as the said James King the younger should by deed or will give or appoint the same unto; and in default thereof, the same was to be paid to the executors or administrators of the said James King.

And by the same articles, James King the younger covenanted, that if he received the said thousand pounds, payable after James Sutton's death, according to such covenant, that then the heirs, &c. of the said James King the younger, would, within three months after his decease, pay to the said Robert Complin and John Sutton, &c. a thousand pounds to be by them employed in such manner and form, and for such uses, intents, and purposes as were before expressed and limited, touching the thousand pounds, payable after the death of James Sutton.

The articles were executed by all parties, and the marriage soon after took effect.

In January, 1739, James Sutton, the father, died; and James and Anne King having issue a daughter named Anne, who was then living, James King became entitled to the thousand pounds after James Sutton's death, and the executors of Sutton accordingly paid him the same; and he gave them a discharge for it.

In January, 1741, Robert Sutton, one of the trustees, died; and a commission of bankruptcy issued against James King, and he was duly found a bankrupt, and his estate was assigned to Edward Grace, Thomas Garaway, and Timothy Denham.

That she apprehended that John Complin, the surviving trustee, ought to be allowed the thousand pounds so paid to her husband, James King, by Sutton's executors, in the nature of a debt under the commission, by virtue of the covenant in the articles, and that a proportionable part of King's estate, in proportion to what was to be paid to his other creditors, might be paid to the trustees, to be disposed in such a manner as might answer the intention of the said articles.

That she had applied to Complin, and had requested him to prove the said debt of a thousand pounds before the commissioners, and to be admitted a creditor for the same; but that he pretended, though his name was mentioned as a trustee in the articles, yet that he had never executed them; and refused to act in the trust, whereby she and her daughter were in danger of being totally deprived of the benefit of the thousand pounds, intended as a provision for her by the said articles.

She therefore prayed his lordship, that she might be at liberty to name a new trustee in Complin's room; and that such new trustee might be admitted a creditor under the said commission for the said thousand pounds, and might be paid a dividend in proportion with the rest of James King's creditors, and that the money to be received by such trustee, by virtue of such dividend, might be placed out at interest, in such manner as that she might receive the interest thereof during her life, in case she survived her husband; and that the principal monies to be received for such dividend, might go and be paid to such child or children of her by James King, as should happen to be living at the death of the survivor of them, in case there should be any such issue; and in such manner as was directed by the articles; or that his lordship should make such other order, as to him would seem meet.

And on the 21st of January, 1742, this petition came on to be heard before his lordship, and was learnedly argued by counsel on both sides: and the cases of *ex parte* Cazalet, Holland, and Calliford, Tully, and Sparkes, were cited; and on the first hearing, his lordship gave the gentlemen who were counsel for the said Anne King, further time to speak to it, and in the mean time to search for precedents; and upon this petition coming on again before his lordship, and no other precedents to be the point appearing, his lordship was pleased to be of opinion, that he could not relieve the petitioner, Anne King; and therefore he ordered such petition to be dismissed.

ARTICLES of the *Insurance Company at Genoa.* In 1741, an insurance company was formed at Genoa, of which the following twenty-six articles are the plan abbreviated, as much as the sense of them would allow.

Several principal merchants of the city of Genoa having considered the inconveniencies, which the want of an insurance office there exposed them to, determined to erect one for shipping, lives, and slavery on the following conditions.

I. To form a capital of 100,000 pieces of silver called *croisats*, of seven livres, twelve sols bank-money each, for the security of whoever should cause himself to be insured by the company; of which 100,000 pieces, 30,000 shall be deposited in the bank of St. George, in the manner as shall be judged best, and the remaining 70,000 shall be deposited, as hereafter is expressed; and the said sum of 100,000 pieces, and no more, shall be obliged by the assurer during the existence of the said company.

II. That for the execution of the aforesaid deposit of 30,000 pieces, and to compose the capital of the said 100,000 pieces, thirty billets shall be formed and disposed of at 333 $\frac{1}{3}$ of the said pieces, to whatever person inclines to be interested in the said company; and the purchasers thereof, for the number taken, shall transfer or write in; to one of the offices of St. George, to the company's credit, 100 of the said pieces, or their value, for each of the said billets; and for the 233 $\frac{1}{3}$ remaining, they shall oblig themselves under security, to make payment of

of it to the company, in case that through misfortunes (which God forbid) the 30,000 pieces deposited are not sufficient to satisfy the losses. And if it happens that the company have not premium enough to pay the losses, averages, &c. it shall give power to four deputies, or directors, to demand of the proprietors, the proportion, which by a *pro rata*, shall touch each on account of the obligation they have entered into.

III. In order to perfect the formation of the company proposed, Messrs. N. N. who have thought proper to communicate the articles to the merchants of the place, shall be also encharged to admit in quality of an associate or proprietor, those who will engage, and shall appear to them, proper to be admitted into the company proposed, which shall be done by demanding or requiring from them a promise to the following purport, or as it shall be drawn up by the notary public, viz.

"I A. B. approving the project of the Insurance Company, which has been read to, and shewn me by Messrs N. N. and desiring to be aggregated to it, and also to share in it, for ——— actions of 333 $\frac{1}{3}$ pieces each: I promise to oblige myself to the said gentlemen, to write on, or transfer into, one of the offices of St. George, when the said company shall be settled, the just value of 100 pieces of silver, appertaining to the said 300 actions, and to engage myself to fulfil the proposals for the remaining 233 $\frac{1}{3}$ pieces of each action, as shall be more amply expressed in the act of the association; and I will that the present have its full force and value, as if it had been a public act, passed before a sworn notary public, under the hypothecation of my effects present and to come: in faith of which, &c."

IV. When the said three hundred actions shall be employed, and by that the company settled, each person concerned shall be convoked to the place appointed by the before-mentioned gentlemen, and thereby a plurality of votes draw up and establish the act of society, on the footing of the articles here expressed, adding whatsoever shall be judged convenient, and supressing that which shall appear superfluous. The four deputies or directors shall be then elected, two Genoese and two foreigners, though all residing in Genoa, whose business will consist in signing the policies, in the name, and at the risk of the company, according to their instructions: the cashier shall render them an account monthly of what premiums have been received, and they must take care to examine the documents of the assurers, who shall have suffered losses, and to order payment by the cashier; and, in fine, they shall be charged with the care to provide every thing necessary, that may relate either directly or indirectly to the company, and the whole shall be done by an act of the chancellor.

V. Besides the four deputies or directors, the cashier and book-keeper shall be likewise elected, and the salary of each settled; the premiums of insurance for the respective maritime places shall be established; the duration of the company shall be confirmed, as well as the time and employ of the four directors, and the whole shall be duly registered.

VI. The continuance of the society shall be five years, to commence the 1st of January, 1741. But the beginning of the fifth year, 1745, the said company shall assemble to renew the act for five other years, or to provide that which shall be judged convenient, in case of a dissolution; and all those interested in the said company shall be summoned for this purpose.

VII. The proprietors of the above-mentioned actions can neither sell, nor alienate them, without the consent of the four directors, and that during the limited time of the society; but the consent being obtained, the company shall be preferred to any other purchaser.

VIII. At the beginning of every month (after the first) the company's cashier shall give the directors an account of what he has paid or received in the preceding month, &c.

IX. At the beginning of each month, the directors shall also review with exactness the writings, and the book-keeper shall be obliged to a daily attendance, to exercise with all care and diligence, whatsoever is dependant on his office.

X. To the end that those who have insurance to make,

whether residents or strangers, may be encouraged to prefer the company to every other means conducive to their intentions; the premiums shall be lowered to the most moderate price; and as for the rest, when any difficulties or suits happen between the company and the assurers, it is to be understood that they are to be determined by the laws and statutes of the place; and that the company is obliged for all common risks, such as pirates, sea, fire, and restraint of princes; and if the company think proper to underwrite some insurances which may be sometimes offered in which barratry is comprised, or upon good or bad advices, for a premium, proportionate to such conditions, the company shall give the directors their permission.

XI. Conformable to what is practised in other parts, no averages shall be paid, under four *per cent.* but all above this shall be punctually satisfied.

XII. In case of a total loss, the necessary or juridical proofs being produced, the sums insured shall be paid, with the discount of four *per cent.*

XIII. Whereas, the variation of the *agio*, and the current species, are prejudicial both to the insurer and the insured, the company will pay all losses, or averages, in bills of St. George, and the premiums shall be recovered in the same manner.

XIV. Any proprietor, possessed of ten actions, shall have two votes in the assembly of the company; and he that has less, shall have only one.

XV. He that has less than six actions cannot be chosen a director; and the most ancient of the four, shall preside at all general and particular assemblies.

XVI. No one shall have more than twelve actions in property; but (if the case happens) the concerned in the company may act as representatives of some foreigner or citizen, who desires to be admitted by their means; though with this proviso, that he shall advise the names of the co-partners, and the place of their domicile, and the representatives shall oblige themselves to submit to the covenants, which shall be stipulated in the company's instrument of union.

XVII. He that shall not be possessed of at least five actions, shall not be admitted to the company's meetings, but shall be obliged and held to all that shall be determined at them, and submit to all the conditions and resolutions of the society, excepting however, that in the first and last assembly, that shall be had, all the concerned in the said company ought to meet, as has been already hinted.

XVIII. At the end of each year after the company's establishment, balance shall be drawn of all that has been received and paid, and half of the profits shall be proportionably divided among the concerned, and even the whole, if the company does not think it more convenient to leave the other moiety, till the end of the fifth year of the company's duration.

XIX. The cashier elect shall be obliged to give sufficient security.

XX. The directors must never subscribe more than 20,000 dollars on ships with French colours, which they shall esteem good; 15,000 on vessels with the same colours of less tonnage; 12,000 on large barks well armed, and carrying the same colours; 12,000 on ships not under French colours; 8,000 on barks and vessels, with *Latin* sails, and not with French colours.

XXI. The premiums of the parties insured by the company, if they have no concern in it, must be paid immediately; those interested in it shall only pay every six months.

XXII. The damages which the assurers suffer shall be paid, viz. the averages, from the admission of the proof; and the total losses in three months after the intimation, when they appear to be just and clear; or being suspicious, after their verification; or directly with the discount of two *per cent.* besides the four always paid.

XXIII. The directors may not sign for account of the said company, other policies of insurance, than those which shall be tendered them by the public brokers, and this is to avoid any inconvenience.

XXIV. In case of the death of any one of the proprietors, the heirs shall be subject to the event of the defunct's share, and may neither sell, nor alien their actions

tions to any other than the company, in case they find themselves necessitated to sell them.

XXV. The charge or office of the four députies, shall last for one year; and before it ends, the new election of four others shall come one, though with the liberty to confirm all the first four, or at least two of them, which must always be two nationals, and two strangers.

XXVI. In case of a general assembly, the number of the proprietors ought to be at least two thirds of all the said company, and the articles shall not be deemed as passed, if the said two-thirds have not concurred therein.

ARTICLES of the definitive treaty of peace, between his Britannic majesty, the most Christian king, and the king of Spain, concluded at Paris the 10th day of February, 1763, to which the king of Portugal acceded on the same day.

In the name of the Most Holy and Undivided Trinity, Father, Son, and Holy Ghost. So be it.

Article I. There shall be a Christian, universal, and perpetual peace, as well by sea as by land, and a sincere and constant friendship shall be re-established between their Britannic, most Christian, Catholic, and most Faithful majesties, and between their heirs and successors, kingdoms, dominions, provinces, countries, subjects, and vassals, of what quality or condition soever they be, without exception of place, or of persons: so that the high contracting parties shall give the greatest attention to maintain between themselves and their said dominions and subjects, this reciprocal friendship and correspondence, without permitting, on either side, any kind of hostilities by sea or by land to be committed, from henceforth, for any cause, or under any pretence whatsoever, and every thing shall be carefully avoided which might hereafter prejudice the union happily re-established, applying themselves, on the contrary, on every occasion, to procure for each other whatever may contribute to their mutual glory, interests, and advantages, without giving any assistance or protection, directly or indirectly, to those who would cause any prejudice to either of the high contracting parties: there shall be a general oblivion of every thing that may have been done or committed before, or since, the commencement of the war, which is just ended.

II. The treaties of Westphalia of 1648; those of Madrid between the crowns of Great Britain and Spain of 1667, and 1670; the treaties of peace of Nineguen of 1678, and 1679; of Ryfwick of 1697; those of peace and of commerce of Utrecht of 1713; that of Baden of 1714; the treaty of the triple alliance of the Hague of 1717; that of the quadruple alliance of London of 1718; the treaty of peace of Vienna of 1738; the definitive treaty of Aix la Chapelle of 1748; and that of Madrid, between the crowns of Great-Britain and Spain, of 1750; as well as the treaties between the crowns of Spain and Portugal, of the 13th of February, 1668; of the 6th of February, 1715; and of the 12th of February, 1761; and that of the 11th of April, 1713, between France and Portugal, with the guaranties of Great-Britain; serve as a basis and foundation to the peace, and to the present treaty; and for this purpose, they are all renewed and confirmed in the best form, as well as all the treaties in general, which subsisted between the high contracting parties before the war, as if they were inserted here word for word, so that they are to be exactly observed for the future in their whole tenor, and religiously executed on all sides, in all their points which shall not be derogated from by the present treaty, notwithstanding all that may have been stipulated to the contrary by any of the high contracting parties: and all the said parties declare, that they will not suffer any privilege, favour, or indulgence, to subsist, contrary to the treaties above confirmed, except what shall been agreed and stipulated by the present treaty.

III. All the prisoners made, on all sides, as well by land as by sea, and the hostages carried away, or given during the war, and to this day, shall be restored without ransom, six weeks at latest, to be computed from the day of the exchange of the ratification of the present treaty, each crown respectively paying the advances, which shall have been made for the subsistence and maintenance of their prisoners, by the sovereign of the country where they shall have been detained, according to

the attested receipts and estimates, and other authentick vouchers, which shall be furnished on one side and the other: And securities shall be reciprocally given for the payment of the debts which the prisoners shall have contracted in the countries where they have been detained, until their entire liberty. And all the ships of war and merchant vessels which shall have been taken since the expiration of the terms agreed upon for the cessation of hostilities by sea, shall be likewise restored *bona fide*, with all their crews and cargoes: and the execution of this article shall be proceeded upon immediately after the exchange of the ratifications of this treaty.

IV. His most christian majesty renounces all pretensions which he has heretofore formed, or might form, to Nova Scotia, or Acadia, in all its parts, and guaranties the whole of it, and with all its dependencies, to the king of Great Britain: moreover, his most christian majesty cedes, and guaranties to his said Britannick majesty, in full right, Canada, with all its dependencies, as well as the island of Cape Breton, and all the other islands and coasts in the gulph and river of St. Laurence, and, in general, every thing that depends on the said countries, lands, islands, and coasts, with the sovereignty, property, possession, and all rights acquired by treaty or otherwise, which the most christian king, and the crown of France, have had, till now, over the said countries, islands, lands, places, coasts, and their inhabitants, so that the most christian king cedes and makes over the whole to the said king, and to the crown of Great Britain, and that in the most ample manner and form, without restriction, and without any liberty to depart from the said cession and guaranty, under any pretence, or to disturb Great Britain in the possessions above-mentioned. His Britannick majesty, on his side, agrees to grant the liberty of the catholic religion to the inhabitants of Canada: he will consequently give the most effectual orders, that his new Roman catholic subjects may profess the worship of their religion, according to the rites of the Romish church, as far as the laws of Great Britain permit. His Britannick majesty further agrees that the French inhabitants, or others who had been subjects of the most christian king in Canada, may retire with all safety and freedom, wherever they shall think proper, and may sell their estates, provided it be to subjects of his Britannick majesty, and bring away their effects, as well as their persons, without being restrained in their emigration, under any pretence whatsoever, except that of debts, or of criminal prosecutions: the term, limited for this emigration, shall be fixed to the space of eighteen months, to be computed from the day of exchange of the ratifications of the present treaty.

V. The subjects of France shall have the liberty of fishing and drying on a part of the coasts of the island of Newfoundland, such as is specified in the 23th article of the treaty of Utrecht; which article is renewed and confirmed by the present treaty, (except what relates to the island of Cape Breton, as well as to the other islands and coasts, in the mouth, and in the gulph of St. Laurence:) and his Britannick majesty consents to leave the subjects of the most christian king the liberty of fishing in the gulph of St. Laurence, on condition that the subjects of France do not exercise the said fishery, but at the distance of three leagues from all the coasts belonging to Great-Britain, as well those of the continent, as those of the islands situated in the said gulph of St. Laurence. And as to what relates to the fishery on the coast of the island of Cape Breton out of the said gulph, the subjects of the most christian king shall not be permitted to exercise the said fishery, but at the distance of fifteen leagues from the coasts of the island of Cape Breton; and the fishery on the coasts of Nova Scotia or Acadia, and every where else out of the said gulph, shall remain on the foot of former treaties.

VI. The king of Great-Britain cedes the islands of St. Pierre and Miquelon, in full right, to his most christian majesty, to serve as a shelter to the French fishermen: and his said most christian majesty engages not to fortify the said islands, to erect no building upon them, but merely for the convenience of the fishery, and to keep upon them a guard of fifty men only for the police.

VII. In

VII. In order to re-establish peace on solid and durable foundations, and to remove for ever all subject of dispute with regard to the limits of the British and French territories on the continent of America, that, for the future, the confines between the dominions of his Britannick majesty, and those of his most christian majesty, in that part of the world, shall be fixed irrevocably by a line drawn along the middle of the river Mississippi, from its source to the river Iberville, and from thence, by a line drawn along the middle of this river, and the lake Maurepas and Pontchartrain, to the sea; and for this purpose, the most christian king cedes, in full right, and guaranties to his Britannick majesty, the river and port of the Mobile, and every thing which he possesses, or ought to possess, on the left side of the river Mississippi, except the town of New Orleans, and the island in which it is situated, which still remain to France; provided that the river Mississippi shall be equally free, as well to the subjects of Great Britain, as to those of France, in its whole breadth and length, from its source to the sea, and expressly that part which is between the said island of New Orleans, and the right bank of that river, as well as the passage both in and out of its mouth: it is further stipulated, that the vessels belonging to the subjects of either nation, shall not be stopped, visited, or subject to the payment of any duty whatsoever. The stipulations, inserted in the fourth article, in favour of the inhabitants of Canada, shall also take place, with regard to the inhabitants of the countries ceded by this article.

VIII. The king of Great Britain shall restore to France the islands of Guadaloupe, of Marie Galante, of Desirade, of Martinico, and of Belleisle; and the fortresses of these islands shall be restored in the same condition they were in, when they were conquered by the British arms; provided that his Britannick majesty's subjects, who shall have settled in the said islands, or those who shall have any commercial affairs to settle there, or in the other places restored to France by the present treaty, shall have liberty to sell their lands and their estates, to settle their affairs, to recover their debts, and to bring away their effects, as well as their persons, on board vessels, which they shall be permitted to send to the said islands, and other places restored as above, and which shall serve for this use only, without being restrained on account of their religion, or under any pretence whatsoever, except that of debts, or of criminal prosecutions: and for this purpose, the term of eighteen months is allowed to his Britannick majesty's subjects, to be computed from the day of the exchange of the ratifications of the present treaty; but, as the liberty, granted to his Britannick majesty's subjects, to bring away their persons and their effects, in vessels of their nation, may be liable to abuses, if precautions were not taken to prevent them: it has been expressly agreed between his Britannick majesty and his most christian majesty, that the number of English vessels, which shall have leave to go to the said islands and places restored to France, shall be limited, as well as the number of tons of each one; that they shall go in ballast: shall set sail at a fixed time; and shall make one voyage only, all the effects, belonging to the English, being to be embarked at the same time. It has been further agreed, that his most christian majesty shall cause the necessary passports to be given to the said vessels; that, for the greater security, it shall be allowed to place two French clerks, or guards, in each of the said vessels, which shall be visited in the landing places, and ports of the said islands, and places restored to France, and that the merchandise, which shall be found therein, shall be confiscated.

IX. The most christian king cedes and guaranties to his Britannick majesty, in full right, the islands of Grenada and of the Grenadines, with the same stipulations in favour of the inhabitants of this colony, inserted in the fourth article for those of Canada: and the partition of the islands, called Neutral, is agreed and fixed, so that those of St. Vincent, Dominica, and Tobago, shall remain in full right to Great Britain, and that of St. Lucia shall be delivered to France, to enjoy the same likewise in full right; and the high contracting parties guaranty the partition so stipulated.

X. His Britannick majesty shall restore to France the island of Goree in the condition it was in when conquered: and his most christian majesty cedes, in full right, and guaranties to the king of Great Britain, the river Senegal, with the forts and factories of St. Lewis, Podor, and Galam; and with all the rights and dependencies of the said river Senegal.

XI. In the East-Indies, Great Britain shall restore to France, in the condition they are now in, the different factories, which that crown possessed, as well on the coast of Coromandel, and Orixá, as on that of Malabar, as also in Bengal, at the beginning of the year 1749. And his most christian majesty renounces all pretension to the acquisitions which he made on the coast of Coromandel and Orixá, since the said beginning of the year 1749. His most christian majesty shall restore, on his side, all that he may have conquered from Great Britain, in the East Indies, during the present war; and will expressly cause Nattal and Tapanouilly, in the island of Sumatra, to be restored; he engages further, not to erect fortifications, or to keep troops in any part of the dominions of the Subah of Bengal. And in order to preserve future peace on the coast of Coromandel and Orixá, the English and French shall acknowledge Mahomet Ally Khan for lawful Nabob of the Carnatick, and Salabat Jing for lawful Subah of the Decan; and both parties shall renounce all demands and pretensions of satisfaction, with which they might charge each other, or their Indian allies, for the depredations, or pillage, committed, on the one side, or on the other, during the war.

XII. The island of Minorca shall be restored to his Britannick majesty, as well as fort St. Philip, in the same condition they were in, when conquered by the arms of the most christian king; and with the artillery which was there, when the said island, and the said fort, were taken.

XIII. The town and port of Dunkirk shall be put into the state fixed by the last treaty of Aix-la-Chapelle, and by former treaties. The Cunette shall be destroyed immediately after the exchange of the ratification of the present treaty, as well as the forts and batteries which defend the entrance on the side of the sea; and provision shall be made, at the same time, for the wholesomeness of the air, and for the health of the inhabitants, by some other means, to the satisfaction of the king of Great Britain.

XIV. France shall restore all the countries belonging to the electorate of Hanover, to the landgrave of Hesse, to the duke of Brunswick, and to the count of La Lippe Buckebourg, which are, or shall be occupied by his most christian majesty's arms: the fortresses of these different countries shall be restored in the same condition they were in, when conquered by the French arms; and the pieces of artillery, which shall have been carried elsewhere, shall be replaced by the same number, of the same bore, weight, and metal.

XV. In case the stipulations, contained in the 13th article of the preliminaries, should not be completed at the time of the signature of the present treaty, as well with regard to the evacuations to be made by the armies of France of the fortresses of Cleves, Wesel, Guelders, and of all the countries belonging to the king of Prussia, as with regard to the evacuations to be made by the British and French armies of the countries which they occupy in Westphalia, Lower Saxony, on the Lower Rhine, the Upper Rhine, and in all the empire, and to the retreat of the troops into the dominions of their respective sovereigns: their Britannick, and most christian majesties promise to proceed, *bona fide*, with all the dispatch the case will permit of, to the said evacuations, the entire completion whereof they stipulate before the fifteenth of March next, or sooner if it can be done; and their Britannick and most christian majesties further engage, and promise to each other, not to furnish any succours, of any kind, to their respective allies, who shall continue engaged in the war in Germany.

XVI. The decision of the prizes made, in time of peace, by the subjects of Great Britain, on the Spaniards, shall be referred to the courts of justice of the Admiralty of Great Britain, conformably to the rules established among all nations, so that the validity of the said prizes,

between the British and Spanish nations, shall be decided and judged, according to the law of nations, and according to treaties, in the courts of justice of the nation, who shall have made the capture.

XVII. His Britannick majesty shall cause to be demolished all the fortifications which his subjects shall have erected in the bay of Honduras, and other places of the territory of Spain in that part of the world, four months after the ratification of the present treaty: and his catholic majesty shall not permit his Britannick majesty's subjects, or their workmen, to be disturbed, or molested, under any pretence whatsoever, in the said places, in their occupation of cutting, loading, and carrying away logwood: and for this purpose, they may build without hindrance, and occupy without interruption, the houses and magazines which are necessary for them, for their families, and for their effects: and his catholic majesty assures to them, by this article, the full enjoyment of those advantages and powers, on the Spanish coasts and territories, as above stipulated, immediately after the ratification of the present treaty.

XVIII. His catholic majesty desists, as well for himself, as for his successors, from all pretension which he may have formed, in favour of the Guipuscoans, and other his subjects, to the right of fishing in the neighbourhood of the island of Newfoundland.

XIX. The king of Great Britain shall restore to Spain all the territory which he has conquered in the island of Cuba, with the fortresses of the Havanna, and this fortress, as well as all other fortresses of the said island, shall be restored in the same condition they were in when conquered by his Britannick majesty's arms; provided, that his Britannick majesty's subjects, who shall have settled in the said island, restored to Spain by the present treaty, or those who shall have any commercial affairs to settle there, shall have liberty to sell their lands, and their estates, to settle their affairs, to recover their debts, and to bring away their effects, as well as their persons, on board vessels which they shall be permitted to send to the said island restored as above, and which shall serve for that use only, without being restrained on account of their religion, or under any pretence whatsoever, except that of debts, or of criminal prosecutions: and for this purpose, the term of eighteen months is allowed to his Britannick majesty's subjects, to be computed from the day of the exchange of the ratifications of the present treaty: but as the liberty, granted to his Britannick majesty's subjects, to bring away their persons and their effects, in vessels of their nation, may be liable to abuses, if precautions were not taken to prevent them: it has been expressly agreed, between his Britannick majesty and his catholic majesty, that the number of English vessels, which shall have leave to go to the said island restored to Spain, shall be limited, as well as the number of tons of each one: That they shall go in ballast; shall set sail at a fixed time; and shall make one voyage only; all the effects belonging to the English being to be embarked at the same time: it has been further agreed, that his catholic majesty shall cause the necessary passports to be given to the said vessels; that, for the greater security, it shall be allowed to place two Spanish clerks, or guards, in each of the said vessels, which shall be visited in the landing-places, and ports of the said island restored to Spain, and that the merchandize, which shall be found therein, shall be confiscated.

XX. In consequence of the restitution stipulated in the preceding article, his catholic majesty cedes and guaranties, in full right, to his Britannick majesty, Florida, with fort St. Augustin, and the bay of Pensacola, as well as all that Spain possesses on the continent of North America, to the east, or to the south-east, of the river Mississippi. And in general, every thing that depends on the said countries, and lands, with the sovereignty, property, possession, and all rights, acquired by treaties or otherwise, which the catholic king and the crown of Spain, have had, till now, over the said countries, land, places, and their inhabitants; so that the catholic king cedes and makes over the whole to the said king, and to the crown of Great Britain, and that in the most ample manner and form. His Britan-

nick majesty agrees, on his side, to grant to the inhabitants of the countries, above ceded, the liberty of the catholic religion: he will consequently give the most express, and the most effectual orders, that his new Roman catholic subjects may profess the worship of their religion, according to the rites of the Roman church, as far as the laws of Great-Britain permit: his Britannick majesty further agrees, that the Spanish inhabitants, or others, who had been subjects of the catholic king in the said countries, may retire, with all safety and freedom, wherever they think proper; and may sell their estates, provided it be to his Britannick majesty's subjects, and bring away their effects, as well as their persons, without being restrained in their emigrations, under any pretence whatsoever, except that of debts, or of criminal prosecutions: the term, limited for this emigration, being fixed to the space of eighteen months, to be computed from the day of the exchange of the ratifications of the present treaty. It is moreover stipulated, that his catholic majesty shall have power to cause all the effects, that may belong to him, to be brought away, whether it be artillery, or other things.

XXI. The French and Spanish troops shall evacuate all the territories, lands, towns, places, and castles, of his most faithful majesty, in Europe, without any reserve, which shall have been conquered by the armies of France and Spain, and shall restore them in the same condition they were in when conquered, with the same artillery and ammunition, which were found there: and with regard to the Portuguese colonies in America, Africa, or in the East-Indies, if any change shall have happened there, all things shall be restored on the same footing they were in, and conformably to the preceding treaties which subsisted between the courts of France, Spain, and Portugal, before the present war.

XXII. All the papers, letters, documents, and archives, which were found in the countries, territories, towns, and places, that are restored, and those belonging to the countries ceded, shall be, respectively and *bona fide*, delivered, or furnished at the same time, if possible, that possession is taken, or, at latest, four months after the exchange of the ratifications of the present treaty, in whatever places the said papers or documents may be found.

XXIII. All the countries and territories, which may have been conquered, in whatsoever part of the world, by the arms of their Britannick and most faithful majesties, as well as by those of their most christian and catholic majesties, which are not included in the present treaty, either under the title of cessions, or under the title of restitutions, shall be restored without difficulty, and without requiring any compensation.

XXIV. As it is necessary to assign a fixed epoch for the restitutions, and the evacuations, to be made by each of the high contracting parties; it is agreed, that the British and French troops shall complete, before the 15th of March next, all that shall remain to be executed of the XIIth and XIIIth articles of the preliminaries, signed the third day of November last, with regard to the evacuation to be made in the empire, or elsewhere. The island of Belleisle shall be evacuated six weeks after the exchange of the ratifications of the present treaty, or sooner, if it can be done. Guadeloupe, Desirade, Marie Galante, Martinico, and St. Lucia, three months after the exchange of the ratifications of the present treaty, or sooner, if it can be done. Great-Britain shall likewise, at the end of three months after the exchange of the ratifications of the present treaty, or sooner, if it can be done, enter into possession of the river and port of the Mobile, and of all that is to form the limits of the territory of Great-Britain, on the side of the river Mississippi, as they are specified in the VIIIth article. The island of Goree shall be evacuated by Great-Britain, three months after the exchange of the ratifications of the present treaty; and the island of Minorca, by France, at the same epoch, or sooner, if it can be done: and according to the conditions of the VIth article, France shall likewise enter into possession of the islands of St. Peter, and of Miquelon, at the end of three months after the exchange of the ratifications of the present treaty. The factories in the Indies shall

A R T

shall be restored six months after the exchange of the ratifications of the present treaty, or sooner, if it can be done. The fortrefs of the Havana, with all that has been conquered in the island of Cuba, shall be restored three months after the exchange of the ratifications of the present treaty, or sooner, if it can be done: and, at the same time, Great-Britain shall enter into possession of the country ceded by Spain, according to the XXth article. All the places and countries of his most faithful majesty, in Europe, shall be restored immediately after the exchange of the ratifications of the present treaty; and the Portuguese colonies, which may have been conquered, shall be restored in the space of three months in the West-Indies, and of six months in the East-Indies, after the exchange of the ratifications of the present treaty, or sooner, if it can be done. All the fortresses, the restitution whereof is stipulated above, shall be restored, with the artillery and ammunition, which were found there at the time of the conquest. In consequence whereof, the necessary orders shall be sent by each of the high contracting parties, with reciprocal passports for the ships that shall carry them, immediately after the exchange of the ratifications of the present treaty.

XXV. His Britannick majesty, as elector of Brunswick Lunenbourg, as well for himself, as for his heirs and successors, and all the dominions and possessions of his said majesty in Germany, are included and guarantied by the present treaty of peace.

XXVI. Their sacred Britannick, most christian, catholic, and most faithful majesties, promise to observe, sincerely and *bona fide*, all the articles contained and settled in the present treaty; and they will not suffer the same to be infringed, directly or indirectly, by their respective subjects; and the said high contracting parties, generally and reciprocally, guaranty to each other all the stipulations of the present treaty.

XXVII. The solemn ratifications of the present treaty, expedited in good and due form, shall be exchanged in this city of Paris, between the high contracting parties, in the space of a month, or sooner, if possible, to be computed from the day of the signature of the present treaty.

In witness whereof, we the under-written, their ambassadors extraordinary, and ministers plenipotentiary, have signed with our hand, in their name, and in virtue of our full powers, the present definitive treaty, and have caused the seal of our arms to be put thereto.

Done at Paris the tenth of February, 1763.

SEPARATE ARTICLES.

I. Some of the titles made use of by the contracting powers, either in the full powers, and other acts, during the course of the negotiation, or in the preamble of the present treaty, not being generally acknowledged; it has been agreed, that no prejudice shall ever result therefrom to any of the said contracting parties, and that the titles, taken or omitted, on either side, on occasion of the said negotiation, and of the present treaty, shall not be cited, or quoted as a precedent.

II. It has been agreed and determined, that the French language made use of in all the copies of the present treaty, shall not become an example, which may be alleged, or made a precedent of, or prejudice, in any manner, any of the contracting powers; and that they shall conform themselves, for the future, to what has been observed, and ought to be observed, with regard to, and on the part of powers, who are used, and have a right, to give and to receive copies of like treaties in another language than French; the present treaty having still the same force and effect, as if the aforesaid custom had been therein observed.

III. Though the king of Portugal has not signed the present definitive treaty, their Britannick, most christian, and catholic majesties, acknowledge, nevertheless, that

his most faithful majesty is formally included therein as a contracting party, and as if he had expressly signed the said treaty: consequently their Britannick, most christian, and catholic majesties, respectively and conjointly, promise to his most faithful majesty, in the most express and most binding manner, the execution of all and every the clauses, contained in the said treaty, on his act of accession.

The present separate articles shall have the same force as if they were inserted in the treaty.

In witness whereof, we the underwritten ambassadors extraordinary, and ministers plenipotentiary of their Britannick, most christian, and catholic majesties, have signed the present separate articles, and have caused the seal of our arms to be put thereto.

Done at Paris the tenth of February, 1763.

Declaration of his most christian majesty's plenipotentiary, with regard to the debts due to the Canadians.

The king of Great-Britain having desired, that the payment of the letters of exchange and bills, which had been delivered to the Canadians for the necessities furnished to the French troops, should be secured, his most christian majesty, entirely disposed to render to every one that justice which is legally due to them, has declared, and does declare, that the said bills, and letters of exchange, shall be punctually paid, agreeably to a liquidation made in a convenient time, according to the distance of the places, and to what shall be possible, taking care, however, that the bills and letters of exchange, which the French subjects may have at the time of this declaration, be not confounded with the bills and letters of exchange, which are in the possession of the new subjects of the king of Great-Britain.

In witness whereof, we the underwritten minister of his most christian majesty, duly authorized for this purpose, have signed the present declaration, and caused the seal of our arms to be put thereto.

Done at Paris the tenth of February, 1763.

(L. S.)

Declaration of his Britannick majesty's ambassador extraordinary and plenipotentiary, with regard to the limits of Bengal in the East-Indies.

We the underwritten ambassador extraordinary and plenipotentiary of the king of Great-Britain, in order to prevent all subject of dispute on account of the limits of the dominions of the Subah of Bengal, as well as of the coast of Coromandel and Orixa, declare, in the name and by order of his said Britannick majesty, that the said dominions of the Subah of Bengal shall be reputed not to extend farther than Yanaon exclusively, and that Yanaon shall be considered as included in the north part of the coast of Coromandel or Orixa.

In witness whereof, we the underwritten minister plenipotentiary of his majesty the king of Great-Britain, have signed the present declaration, and have caused the seal of our arms to be put thereto.

Done at Paris the tenth of February, 1763.

BEDFORD, C. P. S.

(L. S.)

ACCESSION Of his most faithful majesty.

In the Name of the Most Holy and Undivided Trinity, Father, Son, and Holy Ghost. So be it.

Be it known to all those to whom it shall, or may belong; the ambassadors and plenipotentiaries of his Britannick majesty, and of his most christian majesty, and of his catholic majesty, having concluded and signed at Paris, the 10th of February of this year, a definitive treaty of peace, and separate articles, the tenor of which is as follows.

[Fiat

[*Fiat insertio.*]

And the said ambassadors and plenipotentiaries having, in a friendly manner, invited the ambassador and minister plenipotentiary of his most faithful majesty to accede thereto in the name of his said majesty; the underwritten ministers plenipotentiary, viz. On the part of the most serene and most potent prince, George the Third, by the grace of God, king of Great-Britain, France, and Ireland, duke of Brunswick and Lunenbourg, arch-treasurer and elector of the holy Roman empire, the most illustrious and most excellent lord, John, duke and earl of Bedford, marquis of Tavistock, &c. minister of state of the king of Great-Britain, lieutenant-general of his forces, keeper of his privy-seal, knight of the most noble order of the garter, and his ambassador extraordinary and plenipotentiary to his most christian majesty; and on the part of the most serene and most potent prince, Don Joseph the First, by the grace of God, king of Portugal and of the Algarves, the most illustrious and most excellent lord, Martin de Mello and Castro, knight professed of the order of Christ, of his most faithful majesty's council, and his ambassador and minister plenipotentiary to his most christian majesty, in virtue of their full powers, which they have communicated to each other, and of which copies shall be added at the end of the present act, have agreed upon what follows; viz. his most faithful majesty desiring most sincerely to concur in the speedy re-establishment of peace, accedes, in virtue of the present act, to the said definitive treaty and separate articles, as they are above transcribed, without any reserve or exception, in the firm confidence that every thing that is promised to his said majesty, will be *bona fide* fulfilled, declaring at the same time, and promising to fulfil, with equal fidelity, all the articles, clauses, and conditions, which concern him. On his side, his Britannick majesty accepts the present accession of his most faithful majesty, and promises likewise to fulfil, without any reserve or exception, all the articles, clauses, and conditions, contained in the said definitive treaty and separate articles, above inserted. The ratifications of the present treaty shall be exchanged in the space of one month, to be computed from this day, or sooner, if it can be done.

In witness whereof, we, ambassadors and ministers plenipotentiary of his Britannick majesty, and of his most faithful majesty, have signed the present act, and have caused the seal of our arms to be put thereto.

Done at Paris, the tenth of February, 1763.

BEDFORD, C. P. S.

(L. S.)

DE MELLO ET CASTRO.

(L. S.)

Declaration of his most faithful majesty's ambassador and minister plenipotentiary, with regard to the alternating with Great-Britain and France.

Whereas, on the conclusion of the negotiation of the definitive treaty, signed at Paris this 10th day of February, a difficulty arose as to the order of signing, which might have retarded the conclusion of the said treaty, we the underwritten, ambassador and minister plenipotentiary of his most faithful majesty, declare, that the alternative observed, on the part of the king of Great-Britain, and the most christian king, with the most faithful king, in the act of accession of the court of Portugal, was granted by their Britannick and most christian majesties, solely with a view to accelerate the conclusion of the definitive treaty, and by that means, the more speedily to consolidate so important and so salutary a work; and that this complaisance of their Britannick and most christian majesties shall not be made any precedent of for the future; the court of Portugal shall not alledge it as an example in their favour; shall derive therefrom no right, title, or pretension, for any cause, or under any pretence whatsoever.

In witness whereof, we, ambassador and minister plenipotentiary of his most faithful majesty, duly authorized for this purpose, have signed the present declaration, and have caused the seal of our arms to be put thereto.

Done at Paris, the tenth of February, 1763.

MARTIN DE MELLO ET CASTRO.

(L. S.)

ARTICLES of commerce between Great Britain and Portugal. See PORTUGAL.

ARTIFICER, is taken for one who is master of his art, or whose calling or employment doth consist chiefly of bodily labour.

If *artificers*, or workmen, conspire not to do any work but at certain prices, &c. they are liable to penalties by the statute 2 and 3 *Edw. VI. cap. 15*. A stranger *artificer* in London, &c. shall not keep above two strangers servants; but he may have as many English servants and apprentices as he can get. *Stat. 21 Hen. VIII.*

Stat. 5 Geo. I. cap. 27. sect. 1. If any person shall contract with, entice, or solicit any artificer in wool, iron, steel, brass, or other metal, clockmaker, watchmaker, or any other artificer of Great-Britain, to go into foreign countries out of the king's dominions, and shall be convicted thereof upon indictment or information, in any of the courts at Westminster, or at the assizes or quarter-sessions, he shall be fined any sum not exceeding a hundred pounds for the first offence, and shall be imprisoned three months, and till the fine be paid; and if any person having been once convicted, shall offend again, he shall be fined at the discretion of the court, and imprisoned twelve months, and till the fine be paid.

Sect. 2. No person shall be prosecuted for the said offences, unless the prosecution be begun within twelve months after the offence.

Sect. 3. If any of the king's subjects, being such *artificers*, shall go into any country out of his majesty's dominions, to exercise or teach the said trades to foreigners; and if any of the king's subjects in any such foreign country, exercising any of the said trades, shall not return into this realm within six months after warning given by the ambassador, minister, or consul of Great-Britain, in the country where such artificer shall be, or by any person authorized by such ambassador, &c. or by one of the secretaries of state, and from thenceforth inhabit within this realm; such person shall be incapable of taking any legacy, or of being an executor or administrator, and of taking any lands, &c. within this kingdom by descent, devise, or purchase, and shall forfeit all lands, goods, &c. within this kingdom to his majesty's use, and shall be deemed an alien, and out of his majesty's protection.

Sect. 4. Upon complaint made upon oath before any justice of peace, that any person is endeavouring to seduce any such *artificer*, or that any such *artificer* hath contracted, or is preparing to go out of his majesty's dominions for the purposes aforesaid; such justice may send his warrant to bring the person complained of before him, or before some other justice; and if it shall appear by the oath of one witness, or by confession, that he was guilty of any of the said offences, such justice may bind him to appear at the next assizes or quarter-sessions; and if such person shall refuse to give security, the justice may commit him to gaol till the next assizes or quarter-sessions, and until he shall be delivered by due course of law; and if any such *artificer* shall be convicted upon indictment of any such promise, contract, or preparation to go beyond-seas for the purposes aforesaid; he shall give such security to the king, not to depart out of his majesty's dominions, as such court shall think reasonable, and shall be imprisoned till security be given.

Sect. 5. If any of the above offences shall be committed in Scotland, the same shall be prosecuted in the court of judicatory, or the circuits there.

ARTILLERY, in military affairs, all sorts of large fire-arms, with their appurtenances; as cannon of all sorts, mortars, musquets, carbines, &c.

Train of *artillery*, is a set or certain number of pieces of ordnance, mounted on carriages with all their furniture, fit for marching, as mortar-pieces, cannons, bombs, carcases, &c. There are trains of *artillery* of the king's magazines, as at the Tower, Portsmouth, Plymouth, &c.

Since the art of war has been improved, by means of those fatal inventions of gunpowder and *artillery*, the manufactory of *artillery* is become an extensive branch of business, and employs no small number of hands.

The larger pieces of *artillery* depend upon the business of foundry, the other upon smithery. The former is commonly

commonly called ordnance, the other small-arms, &c.

To carry on manufactures of ordnance with success, there are various circumstances which are requisite to be well weighed and considered, or the undertakers may be soon undone.

1. The situation of the place for casting of ordnance of iron should be very near ore, and fuel, and water, not for sale and carriage, but for the conveniency of working of bellows for their casting part, and forging hammers for the working up the heads of their cannon, and other superfluous cast iron, which is separated therefrom.

2. The price of labour, as well as that of fuel, ore, and carriage, should also be calculated, in order to be able to judge of the profits of the manufactory, according to the views and expectations of vent for the same.

3. These things considered, the next is that of hiring, or erecting furnaces, forges, and water-mills, and all other conveniencies necessary for the purpose. If hiring, or building, be the intention, due regard should be had to the structure of furnaces, not only that they may be properly built for the occasion, but adapted to the quantity of ore designed to be smelted at a time; and that the bellows be so hung as to give the necessary continued blast. These things depend on the care and skill of able and experienced workmen, or rather upon the master-founder himself, who has the conduct of the whole.

4. But, let his judgment and experience be ever so great, yet if the several workmen, the operators in the various classes, are not equal to their respective parts, the undertakers may soon be ruined; for there is such an accuracy in casting large pieces of ordnance, that seventeen pieces out of thirty have been known not to stand proof upon trial, though cast at one of the best founderies in the kingdom; which proved a great loss to the proprietors.

5. There is much in this art that depends upon a careful and ingenious mould-maker; and more on the method of preparing the ore, and smelting it with such fluxes as will render the metal constantly so tough as is necessary to stand all proof. When this is skilfully done, those accidents before-mentioned can very rarely happen; as no little defect in the moulds could change the general texture, compactness, and toughness of the metal; little tuberosities in the moulds could never have that effect as to prevent such metal standing proof, if it was as good as it ought to be.

These accidents, to which our iron foundries are liable in the casting of ordnance, seem to indicate that this art is not yet brought to its last perfection.

Under the articles IRON and FOUNDRY, we shall shew the methods of smelting the various species of ores for ordnance, and other matters, which are made of cast iron; and endeavour to point out the causes of those miscarriages, which may, in some measure, possibly, contribute to prevent their frequency. And, in regard to the making of brass ordnance, that will be represented under the articles BRASS and FOUNDRY.

The art of war, at present, depending so much upon the goodness of destructive artillery, and other nations pluming themselves on the superior excellency of theirs, in seems prudential, from the principles of self-defence only, that we should not be behind them in what so nearly concerns us.

That other nations are making all the advances they can in this art, we had an account not long since from the Austrian camp at Bostell, that proof was there made of eight pieces of cannon, made of hammered or forged iron, of a new invention; each piece firing a hundred times in fifteen minutes, without requiring to be once cleaned. Besides the advantages of quickness in firing, the touch-hole, it was said, suffered not in the least by the number of discharges that were made. Within a short time after this, to shew that the French would not be behind-hand with the Austrians in that point, we had the following repeated account from Paris in all the foreign papers.

“We learn from Paris, that certificates have been produced there from the officers of the marine in several parts of Normandy, in relation to the excellence of the new-invented artillery, made of forged iron; by which it appears that one of these pieces, carrying a ball of

twelve pounds, proved equal in every respect to one of brass, and another of cast iron of double the weight; and that these new-invented cannon may be managed by half the number of hands.”

As the officers of the French marine made this report, we may presume this new-invented cannon was chiefly intended for the royal navy; and, if the French should ever be capable of doing the same execution at sea, with one half the weight of metal that we are, it does not require the gift of prophecy to judge of the consequences.

In another account we had from Paris, July 4, 1750, “The sieur Dedorean, master of the iron-works in Picardy, has found the secret of completing a sort of cannon, by the help of which very extraordinary execution may be done, far superior to any thing of the like kind. It is composed of hammered iron plates, soldered together, which make the piece lighter than ordinary, without being subject to burst; or, if by accident it should fly, it may be immediately repaired on the spot, with the help only of the hammer and solder.”

Monsieur de la Valiere, lieutenant-general of the artillery, very much commends this invention, a proof of which was to be made in the arsenal; and the inventor was in hopes that he should be able, with the assistance of one man only, to forge and complete fifty of those guns in a year.

Were other nations agreed to lay aside those instruments of violence, so horribly destructive of the human species, we might then, with equal safety, lay them aside also; but, as self-defence and preservation render it necessary to be upon a level with our enemies, improvements of the like kind should not be neglected on our part.

As artillery comes under the article of arms and utensils of war, &c. it is proper to observe, that it cannot be imported without licence from his majesty; and, if otherwise, the whole is not only forfeited, but treble the value. 1 Jac. II. cap. 8. sect. 2.

Such licence being obtained, except for the furnishing of his majesty's public stores, is void, and the offender incurs a præmunire, and is disabled to hold any office from the crown. See AMMUNITION and ARMS.

ARTOIS, a country in France, is bounded by Flanders on the north, and partly on the east, on which side it borders also on Hainault and Cambresis, and it is bounded by Picardy on the south and west. The chief trade of this country consists in corn, flax, hops, wool, oil of cabbage and turnep-seed, and linen cloth made at *Bethune, Aire, St. Venant, La Gorgue, Bapaume*, and in their neighbourhood, which is the chief manufacture they have in Artois. The city of *Arras* is inhabited by wealthy traders and artificers, who make sails and tapestry hangings, especially the latter, which art was invented here. The people of *St. Omer* have some trade, several small vessels coming up here from the sea, through Gravelines, by the river Aa. At *Bethune*, is made an excellent sort of cheese, and sold in all the neighbouring countries. It is a place of some trade, and has two annual fairs.

ARUM, *wake-robin*, or *cuckow-pint*. Dr. Tournefort ranges this genus of plants in the first-section of his third class of plants, intituled, “Herbs with an anomalous or cowed flower of one leaf.” The whole structure of the flower in this genus is very singular.

It grows naturally on the sides of banks, and in shady places, in most parts of England, flowers in April, and the seeds are ripe in July, when they are of a deep orange-colour. The roots of this plant are used in medicine. They are full of acrimony; so that if a person taste it when it is in vigour, it will bite the tongue the whole day; and in this acrimony consists the virtue of the root; therefore those who make use of it should take up the roots soon after the seeds are ripe, when they are inactive and firm; and the roots which are at that season taken up, will retain their pungency the whole year; whereas those which are gathered in the spring, when the leaves are fresh, will shrink up in a few days, and lose all their virtue.

Arum is recommended for cutting viscid phlegm in the asthma: it strengthens the stomach, expels the acid adhering to its *plicæ*, and is good against agues and the scurvy. Its acrimony is fixed by infusing the root in

vinegar, whence it is endowed with a diuretic salt, of good efficacy in falls from high places.

ARUNDEL, west longitude, 30 min. latitude 50 deg. 45 min. a town situate on the river Arun, in the county of Suffex, fifty miles south-west of London, and ten miles east of Chichester.

By an act made 6 Geo. II. cap. 12. sect. 1. The mayor of Arundel and others are appointed commissioners to improve and preserve the harbour of *Arundel*; and it shall be lawful for the commissioners, or any one of them, to erect piers and other works.

SECT. 2. There shall be paid to the commissioners the duties following, viz. for every chaldron of coals, grindstones, or other goods paying duty to the king by the chaldron, which shall be exported or imported in the said port, 1 s. for every ton of salt, and other goods paying duty or freight by the ton, 1 s. for every load of timber, waincot, trenals, or other converted timber, 1 s. for every load of bark; 2 s. for every hundred of spars, ufirs, pipe, hogthead, or barrel-staves, 1 s. for every hundred of single deals, 1 s. 6 d. of double deals, 2 s. of three-inch deals, 2 s. 6 d. for every quarter of wheat, clover, and other grains and feeds, 3 d. for every load of flour or meal, 1 s. and of bran, 6 d. for every hogthead of wine or other liquors, 1 s. of sugar and dry goods, 9 d. for every tierce thereof, 6 d. and for every barrel of pitch or other goods, 4 d. for every bundle, bale, and chest of hemp, linen, woollen, glass, fruits, and earthen ware, 1 d. per hundred weight; for every hundred weight of allum, and goods paying duty or freight per hundred weight 1 d. for every hundred feet of paving stone or marble, 2 s. for every thousand of tiles, bricks, or clinkers, 1 s. for every gross of bottles, stone, or glass, 3 d. for every barge, or other craft, passing through each lock, 1 s. for all goods not enumerated, one twelfth of the usual freight from London to Arundel; for every British ship, which shall load or unload, fishing-vessels excepted, 3 d. per ton, according to their bills; for every British ship, which shall sail into the harbour, and shall neither load nor unload there, 1 d. 2 q. per ton; for every foreign ship, and for all goods, imported and exported in foreign bottoms, double duties.

SECT. 3. No ship shall be cleared at the custom-house, till the master produces a certificate that the duties are paid or secured, &c.

SECT. 8. When it shall appear to the justices, and be certified by them, that the commissioners are reimbursed the monies borrowed, one half of the duties shall cease.

SECT. 10. All ships in the port of Arundel are to moor and ballast in such places as the masters shall be directed, &c.

SECT. 15. This act shall be a public act, &c.

AS, in antiquity, sometimes means a particular weight, in which sense the Roman *as* is the same as the *libra*, or Roman pound, consisting of twelve ounces. Sometimes it signifies a Roman coin, which was of different matter and weight, according to the different ages of the commonwealth; therefore Varro derives the word *as* from *æs*, because this piece of money was first made of copper of a pound weight; and *as*, *æs*, *pondo*, and *mina*, among ancient authors, generally pass for the same. It is also used to signify an integer, divisible into twelve parts, whence comes our word *ace* or *unit*; and for this reason, some will have *as* derived from the Doric *ais*, for *eis*, one.

As, also signifies at Amsterdam the division of the pound, avoirdupoise weight: thirty-two *as*'s make an *engel*, ten *engels* a *loot*, and thirty-two *loots* a pound.

ASARUM, Offic. Ger. 688. Raii Hist. 1. 207. Tourn. Infl. 501. Boerh. Ind. A. 2. 95. *Asarabacca*. This plant is by some called *wild nard*; it has leaves like ivy, but much thicker and rounder. The flower grows in the middle of the leaves near the root, and is of a blue colour, resembling that of henbane, and inclosing a seed like a grape-stone. The roots are numerous, jointed, slender, running obliquely, resembling those of dog's-grass, but much slenderer, of a fragrant smell, and taste very hot and biting upon the tongue. The roots are heating, diuretic, and emetic, and are good in a dropfy, or inveterate sciatica; they also provoke the menses. Six drams thereof, taken in hydromel, purge like white hellebore. They are also an ingredient in ointments.

ASBESTOS. See AMIANTUS.

ASCII, in geography, the inhabitants of the torrid zone; so called because twice a year they have the sun at noon in their zenith, and consequently their bodies then cast no shadow.

ASCLEPIAS, Tourn. Infl. R. H. 93. Tab. 22. Raii Meth. Plant. 78. Lin. Gen. Plant. 270. Swallow-wort, or tame poison; in French, *dompte-venin*; in Latin, *vinetoxicum*. This plant is found growing naturally in rough uncultivated places in France, Italy, and Germany; and being a medicinal plant, is kept in the English gardens. The root of this plant, which is the part used in medicine, is esteemed a good counter-poison, and is prescribed for malignant peccilential fevers.

ASEM, AZEM, or ACHAM, a kingdom, and one of the best countries in the East-Indies, is rich in mines of almost all sorts of metals, such as gold, silver, lead, iron, &c. It also produces a large quantity of coarse silk, and the best lacque in all the world. All the mines belong to the king, and the gold is prohibited exportation, though the silver coin makes an article in trade, and may be carried off by strangers. Another branch of commerce, and that no small one, consists in bracelets and collars for the arms and legs, of which they use great quantities themselves, and send as considerable into the kingdom of Boutan. This kingdom is bounded by Independent Tartary and Boutan on the north; Tipra on the south; part of China on the east; and of Mogul on the west, from which it is divided, according to some maps, by the river Arracan.

ASH. See TIMBER.

ASHES, the terrene or earthy part of wood, and other combustible bodies, remaining after they are burnt or consumed with fire.

Ashes are properly the earth, and fixed salts of fuel, which the fire cannot raise, all the other principles being gone off in the smoke.

Ashes of all sorts contain in them a very rich fertile salt, and are the best manure of any for cold or wet land, especially if kept dry, that the rain does not wash away their salt: one load of *ashes* kept so, will go as far as two that get wet. But, as rain-water diminishes their salt, so the moistening them with chamber-lie, or soap-suds, will add greatly to their strength. Two loads of those *ashes* will manure an acre of land better than six loads of those that are exposed to rain, and not so ordered, which is the common allowance for an acre.

Mr. Switzer, treating of the superficial dressing of corn and meadow-land, as being of excellent use, by giving a new ferment to such lands as are in any degree sluggish and inactive, and enriching those that are jejune and slow, very much recommends *ashes*, as being endowed with singular qualities for rendering them prolific.

Coal-ashes: by those are meant the *ashes* of Newcastle, Scotch, and other pit-coals, the former of which he prefers to the latter, as containing a greater quantity of nitrous and sulphureous matter than the others, though the rest are all good; for there is scarce any vegetable but what will receive benefit from them, if they are applied superficially, and not too near the roots.

ASHES, called *pearl-ashes*, of the product of Germany, may be brought from thence, paying duty as *pot-ashes*. 10 and 11 Will. III. cap. 21. sect. 30.

Pot-ashes or *pearl-ashes* made in, and imported from the British colonies in America, if regularly entered at the custom-house, landed in the presence of, and examined by the proper officer, and imported in ships which may lawfully trade thither, legally manned, are free of all duties: 24 Geo. II. cap. 51. sect. 1, 2. But the person shipping them in America must, before clearing out the vessel, make proof upon oath before the collector and comptroller of the customs, and naval officer (or any two of them) at the port where they are shipped, that they are *bona fide* of the product and manufacture of the British plantations in America, expressing the quantity and the place where made, and by whom. The person taking charge of the vessel must bring with him a certificate from the said officers, under their hands and seals of office, expressing the marks and number of the packages, the weight and tale of the *ashes*, and the names and places of abode of the exporter, and the person who has sworn to the product, &c. and deliver it, at or before entry, to the chief officer of the customs at the port

port of importation, and make oath before him, that the casks and parcels, and goods in the certificate, are the same as were taken on board his ship in the British plantations in America. 24 Geo. II. cap. 51. sect. 3.

On failure of any of the conditions and directions before-mentioned, they are liable to pay duty as before. 24 Geo. II. cap. 51. sect. 2, 3.

Officers falsely making such certificate, forfeit two hundred pounds, and their offices, and are incapable of serving his majesty; and any person falsely making an oath required by this act, incurs the punishment of wilful and corrupt perjury; counterfeiting a certificate, or knowingly publishing such a one, the punishment of forgery. 24 Geo. II. cap. 51. sect. 5.

Foreign entered as British plantation, or mixed therewith, to evade the duties, the whole forfeited, with the package; and the persons entering or mixing, or causing such entry or mixture to be made, forfeit fifty pounds for every offence. 24 Geo. II. cap. 51. sect. 4.

In case of any dispute about the product and manufacture, the *onus probandi* to lie on the owner or claimer. 24 Geo. II. cap. 51. sect. 8.

Penalties and forfeitures may be prosecuted in any court of record at Westminster, the court of exchequer in Scotland, or courts of admiralty in the British plantations in America; to be divided in Great-Britain, half to his majesty, and half to the person who sues for it: but if incurred in America, one third to his majesty, one third to the governor, and one third to the person who sues for it. 24 Geo. II. cap. 5. sect. 6, 7.

White-ashes may not be shipped, nor conveyed towards part beyond the seas, upon forfeiture of six shillings and eight pence *per* bushel. 2 and 3 Edw. VI. cap. 26. sect. 1.

ASHLAR, a term used by builders, by which they mean common free-stones, as they come out of the quarry, of different lengths and thickneses. Nine inches is the common thicknes.

ASHLERING, with builders, quartering to tack to in garrets about two feet and a half, or three feet high, perpendicular to the floor, up to the under-side of the rafters.

ASIA, is allowed to be, in all respects, by far the most considerable part of the world, and though our innate fondness for our own country makes us give the preference to Europe; yet *Asia* has many singular advantages, which may justly intitle it to the first rank.

It was in *Asia* that the great Author of Nature planted the delicious garden of Eden, in which he placed the first man and woman, from whom the rest of mankind were to spring. *Asia* became again the nursery of the world, after it had been destroyed by the flood, from which the descendants of Noah dispersed their various colonies into all other parts of the globe. It was in *Asia*, that God made choice of the delicious Canaan, to place his favourite nation the Hebrews in. It was here that the great and merciful work of our redemption was accomplished by his Divine Son; and it was from hence that the light of his glorious Gospel was carried into all nations, by his disciples and followers. Here it was that the first Christian churches were founded; the first councils held, the first bishopricks erected, and the Christian faith miraculously founded, promulgated, and watered with the blood of innumerable martyrs. Lastly, it was in *Asia* that not only the first edifices were raised, and the first cities built, but likewise where the first kingdoms and monarchies were founded, whilst the other parts of the world were, if at all, inhabited only by wild beasts.

Nor are these advantages the only this part of the world has over the other three; but it exceeds them in the largeness of its territories, the richness and fertility of its soil, the serenity of its air, the deliciousness of its fruits, the salubrity of its drugs, the fragrant and balsamic quality of its plants, spices, and gums; the quantity, variety, beauty, and value of its gems; the fineness of its silks and cottons; the richness of its metals, and many more of the like nature: upon all which accounts, it was always esteemed so charming and delightful an abode, that it was the constant seat of the greatest monarchies in the world. It must be owned, indeed, that since the Turks, enemies to science, politeness, and liberty, have been masters of so considerable a part of it,

it has quite therein lost its ancient splendor, and from the most polite and fruitful spot in all *Asia*, is become a wild uncultivated desert, and only considerable since that time for the rich commodities it affords; on which account it is still visited and resorted to by merchants of other nations. But those who have escaped the Turkish tyranny, are still in a flourishing condition, which is rather to be attributed to the richness of the soil, than the industry of the inhabitants, who are justly censured for their natural indolence, effeminacy, and luxury.

This effeminacy is chiefly owing to the warmth of the climate, though perhaps heightened by custom and education, and the symptoms of it are more or less apparent, as they are seated nearer or farther from the north. It is plain that the southern climates are not productive of such robust natures as the northern; whence it may be inferred, that those Asiatics, who live near the same latitude with us, cannot be much inferior to us in this respect; at least, it appears that several of them, particularly the Turks and Tartars, are men of as much strength and courage as any we know of. As to those who live in the more southern regions of *Asia*, what is wanting in the robust frame of their bodies, seems, in a great measure, made up to them by the vivacity of their minds, and ingenuity of various kinds of workmanship, which our most skilful mechanics have in vain tried to imitate. Whether the reflection commonly cast on all Asiatic nations be altogether just, that they are naturally excessive admirers of monarchy, we will not pretend to determine, their princes having always kept them in such abject slavery, that they never had an opportunity of displaying their love of liberty, which, otherwise, we must suppose to be as natural to them as the rest of mankind. Thus much, however, is certain, that many of those nations, upon the coming of the Dutch among them, could not conceive how it was possible for any nation to live under a republican government, or, indeed, under any other form than a despotic monarchy, which is the only that obtains in all the parts of this extensive division of the globe.

The indifference therefore with respect to virtue, of the Asiatic nations under a despotic monarchy, or under such an empire as the Turkish; their ignorance and abject state of mind, are the necessary consequences of their form of government, and must always have a tendency to bring on its dissolution. How can slaves, educated under the menacing brow of a master, stifled, at the approach of a hardy enemy, the habitual sensations of fear they have contracted from arbitrary power? How can men so debased, without elevation of mind, accustomed to trample on the weak, and to cringe before the powerful, avoid yielding to the magnanimity, the policy, the valour of a bold enterprising people? How can dastardly slaves resist a free and powerful nation? The tyrant, to make use of arbitrary power with impunity, is forced to enervate the minds and courage of his subjects. What renders him formidable at home, renders him weak abroad: with liberty, he banishes from his empire the splendor of all virtues; for virtue cannot dwell in base and servile minds.

The lustre thrown upon such nations as the Turks, is always of short duration. If sometimes they attain to the highest pitch of power and glory, and become illustrious by success of all kinds, this success is more owing to the prowess of the governing chiefs, than to the form of government. It has always been as fleeting as brilliant. The strength of such states, however it may impose upon us, is but an illusion: it is the colossus of Nebuchadnezzar, of which the feet were of potter's clay. These empires resemble the lofty pine, whose top reaches to the heavens, the beasts of the field, and the birds of the air, seeking for shelter under its branches; but being fixed in the ground by too weak a root, is overthrown by the first storm. Such states have but a momentary existence, if they are not surrounded by nations who are but little disposed to great enterprizes, and are likewise subject to arbitrary power. The respective strength of such nations consists, therefore, in an equilibrium of weakness. If a despotic empire has received a shock, and the throne cannot be secured without a manly and courageous resolution, that empire is destroyed.

The people who groan under the yoke of arbitrary power have therefore only a momentary success, a mere flash of glory; and must, sooner or later, submit to a free and enterprising nation. But supposing that particular circumstances and situations save them from this danger, the bad administration of these kingdoms is sufficient to destroy, depopulate, and convert them into deserts; the lethargic languor that successively seizes all the members produces this effect. The property of despotic power is to silence the passions; and when minds have, by being divested of passions, or through the want of them, lost their activity; when they are emaculated by luxury, indolence, and softness, the state then droops into a consumption. The apparent calm it enjoys is, in the eyes of the intelligent, a languid state, which is the fore-runner of its dissolution. Passions are necessary in a nation, and are its life and soul: the people who have the strongest are in the end triumphant. "O happy times (cries Tacitus, under the reign of Trajan) when people obey only the laws, when every one may think freely, and freely tell his thoughts; when every heart flies to the prince, and the sight of him is a benefit!"

In religion the Asiatics shew still stronger marks of stupidity, a great part of Asia being over-run with Mohammedanism, as Turkey, Arabia, part of Tartary, and India. In Persia and the Mogul territories, they profess the same; but are of the sect of Hali, which differs, in some particulars, from the Turks, though both own Mohammed for their law-giver, and the Koran for their divine rule of faith and life. In other parts of Tartary, in China, Japan, Siam, &c. they are generally heathens and idolaters, entertaining strange notions of the Deity, or rather of their deities, and using the most extravagant rites in their worship of them. It may be said, however, that their multiplicity of idols, and superstitious ceremonies to them, are only regarded by the populace, for whom they are chiefly calculated by their priests, in order to serve the purposes of gain; but there are many excellent men, of too philosophical a turn of mind not to despise them in their hearts, whatever countenance they may seem to give them in outward appearance.

Besides these, there are several sects of the ancient Persians, or followers of the great Zoroaster, dispersed all over India, and other parts of *Asia*, who acknowledge but one Supreme Deity, and are distinguished by the title of fire-worshippers, because they worship it under the symbol of that element: these are enemies to all kinds of idolatry, imagery, temples, and the like, which they look upon as derogatory to the Supreme Being, who neither can nor ought to be represented by images, nor confined in temples. The brachmans, reckoned the most considerable amongst those sects, are of a very humane disposition, lead a contemplative life, feed only upon vegetables, and are so far from killing any living animals for their use, or even noxious ones in their own defence, that they build even hospitals for the maintenance of such, especially the domestic, as are decayed through age, accident, or other infirmities.

Asia is situated between 25 and 148 degrees of eastern longitude, and between the equator and 72 degrees of north latitude; and is divided from Europe by the Archipelago, the Black-Sea, and the Palus Mæotis; and thence by a line from the river Tanais, or Don, almost to the river Oby in Muscovy; from Africa, it is separated by the Red-Sea; and from America, by the great South Sea, or Pacific Ocean. It is bounded on the west by the Black-Sea, and the Mediterranean; on the south and east by the Arabic, Persian, Indian, and Chinese oceans; but how far it reaches that way is not known; and on the north by the Frozen Ocean; so that almost on every side it is surrounded by the sea; only it must be observed, that its limits northwards were not discovered till the reign of the late Czar Peter the Great, from whose survey a map of all Russia was afterwards printed at Amsterdam. According to which, this northern sea begins at a little beyond the seventieth degree of latitude, and extends eastward from Greenland along the coasts of Muscovy, Siberia, &c. till it joins the Oriental, or Japanese Sea; yet how far it may reach northward is not yet known with any certainty.

Asia comprehends to the amount of about thirty-nine

monarchies or sovereignties, four of which are styled entire empires, as Persia, the territories of the Great Mogul, China, and Japan; the most considerable share of two other empires, as Turkey and Russia, is in Europe. It has next to these thirty-three kingdoms, twenty-four of which are on Terra-Firma, and the other seven in islands.

Of the inland kingdoms are those of, 1. Yemen, and 2. Sartach, in Arabia; 3. Vizapor; 4. Golconda; 5. Bishnagha; 6. Calicut, and 7. Cochin, in the peninsula on the other side the Ganges; 8. Siam; 9. Cambaya; 10. Ava, or Pegu; 11. Acham; 12. Aracham; 13. Tunguin; 14. Cochin-china, and 15. Jaos, or Liaos, in the peninsula on the other side the Ganges; 16. Barantola, or Lassa; 17. Neckbat; 18. Cogua, or Great Thibet; 19. Nangu; 20. Little Thibet; 21. Kalghar; 22. Corea; 23. Samarcand, and 24. Becha, in Great Tartary; 25. Mingrelia, and 26. Imeretia, in Georgia.

The insular kingdoms are, 1. the Maldivia isles; 2. Candi, in the isle of Ceylon; 3. Achem; 4. Mataran; 5. Borneo, in the islands of those names in the Sound; 6. Macassar, and 7. Ternate, in the Molucca islands.

Besides these, we may reckon three dominions established here by the Europeans, as 1. of the Spaniards in the Philippine islands; 2. Of the Portuguese in Goa, and other coasts of India; and, 3. Of the Dutch in Batavia, Java, Ceylon, and other isles and coasts. To these we may add the English, French, and Danish settlements, particularly on the coasts of Malabar and Coromandel, with some independent ones, or, as they are called, vagrant nations; because they have no settled abode, but move their tents from place to place, as occasion offers, or fancy leads: the most considerable of these are the tribes called Bengabres, Bedwins, and some others in Arabia, and the Kalmucks in Tartary, who live in hords independent of each other.

It might seem an endless task to enumerate the different tongues and dialects, which are spoken in this vast extent and variety of nations; and yet it may be said, in general, that *Asia* has by far the fewest of any other part of the world. This is chiefly owing to its vast overgrown empires, which commonly strive to introduce an uniformity of language amongst their respective subjects. The principal are the Arabic, Persian, Tartaric, Chinese, Japanese, Malayan, and Malabaric. As for the European languages, as well as some of the learned, they are known to few of the natives, and are only used by those foreigners who have introduced them for their own convenience.

There must be a great variety of climates in *Asia*, as it extends quite from the equator to the polar circle, and beyond, or, for aught we know, even to the pole itself; for it comprehends all the temperate, the greater half of the torrid, and good part of the frigid, zones; so that it enjoys no less than twenty-four climates: yet, upon the whole, if we except some parts of Arabia and Tartary, and some of the more northern tracts, the whole country is rich and fruitful, and some parts of it exceedingly so. Next to America, it is the largest quarter of the four; its length from east to west may be computed at 4800 miles, some say 6000; and its breadth, as far as it is known, from north to south, 4300.

In the division of this part of the world, it may be considered with respect only to the different dominions it is at present subject to; as, 1. Turkey; 2. Persia; 3. India; 4. China; 5. Russian Tartary; and, 6. The Islands. It may, indeed, be here objected, that Tartary is not under one government; that India beyond the Ganges is independent of the Great Mogul, as Arabia is also of the Turks, and that Georgia, Mingrelia, &c. are subject partly to the last, and partly to the Persians, and consequently, that each should be divided into their respective parts. But we think it more eligible to avoid clogging the reader's memory with too many distinctions, to lay down the following general view of the whole.

1. TURKEY in *Asia*, is divided into Western and Eastern. The Western comprehends Anatolia, or Asia-Minor, Syria, Palestine, and the Turkish Arabia. The Eastern contains Diarbeck, Turcomania, and Georgia. They all lie from south to north.

2. PERSIA, is divided into Northern, Southern, and Middle. The Northern contains the provinces of Schirvan, Gilan, Chorasan, &c. the Southern, Cusistan, Fars, Kirman, Macran, &c. the Middle, Erack, Sabblestan, Sigestan, &c. All lie from west to east.

3. *Asiatic* RUSSIA comprehends part of Great Tartary, Siberia, and Samoiëda.

4. CHINA is divided into North and South, the former of which contains the six following large provinces, including Leaotung without the great wall; as, Leaotung, Pekin, Xantung, Xanfi, Honan, and Xenfi. The Southern contains the ten following; as, Nanking, Chikiang, Kiangfi, Tokien, Huguang, Quantung, Suecheen, Quicheu, Quanfi, and Junan. All these extend from east to west.

5. JAPAN, and the land of Yesso.

6. The *Mogul Empire*, in which are many petty kingdoms; but chiefly those of Delli, Agra, Cambaia, and Bengal, so called from their several capitals. The two first are inland, the others on the coasts.

7. INDIA comprehends, 1. The peninsula within the Ganges, containing the kingdoms of Decan, Golconda, Bijnagar, and Malabar, which are situated mostly northward; 2. The peninsula beyond the Ganges, containing those of Pegu, Tonquin, Cochinchina, and Siam, which last is subdivided into Martaban, Siam, and Malacca. They lie from north to south.

The *Asiatic* ISLANDS are divided into two classes, viz. 1. Those in the Indian Ocean, which are Ceylon, the Maldives; the Sunda Islands, as Sumatra, Java, Borneo, &c. the Spice Islands, as Banda, &c. the Moluccas, as Ternate, Timor, &c. those of Amboyna, Ceram, Gilolo, &c. 2. Those on the Eastern Ocean; as the Ladrões, Formosa, and the Philippine Islands.

ASLANI, called also, but somewhat improperly, *assellani*, is the Dutch dollar or piafter, which is current in all the ports of the Levant.

The Turks, who call a lion *aslani*, have given that name to this coin, because there is the figure of a lion struck on both sides of it.

There are two sorts of *aslani*, that of Holland, and that which is struck at Inspruck, in the county of Tyrol. The Dutch dollar is not only of an inferior degree of fineness to that of Inspruck, but, if we may believe Sir John Chardin, so famous for his travels, the money or coin which the Dutch carry to the Levant, is very much mixed with false pieces; the quarter piafters, chiefly, are either intirely counterfeit, or have at most but one half of fine silver. The Arabs, who mistake the lion for a dog, call them *abukesbi*. The *aslani* is worth from 115 to 120 aspers, and sometimes but 80 aspers. The leewen daelder, or lion piafter of Holland, is sometimes equal to the current piafter, and is sometimes worth $33\frac{1}{2}$ per cent. more, as it was towards the end of December, 1729, when the agio of the piafters of eight reals was 65 per cent.

ASPALATHUM, in pharmacy. See RHODIUM.

ASPE'E, a corn-measure in Lyonnois and Mâconois in France. It is also said about Lyons of certain quantity of wine, which is an ass's load.

ASPER, a small silver coin, current among the Turks; its value is something more than that of an English half-penny. When good, 120 of them are given for a French crown of sixty sols (worth about 32 d. English) but as there are a great many false *aspers*, which the bashas and the Jews cause to be struck in the remote provinces, they are seldom received but at the rate of four deniers per *asper*, so that 160 make a French crown. The parats, or meidins, are worth three aspers.

Estimate of the value of the several coins current in the grand seignior's dominions, according to the asper, reckoning the asper at the rate of six deniers French.

120 *aspers* are worth 60 sols of France.

A sequin of Venice and Turkey, 414 *aspers*, or 10 liv. 10 sols, French.

The piafters of Peru and Mexico, of 506 grains French weight, go for 208 to 210 *aspers*.

A rial, or rix-dollar of the empire, 82 *aspers*. In 19.

proportion to the sequin, this ought to be about 130 *aspers*.

The Dutch rix-dollar, 70 *aspers*, ditto 200 *aspers*.

ASPER, is also a money of account, and books are kept at Constantinople, and in all the ports of the Levant, in piafters, or abouquelb, meidins, and *aspers*.

ASPHALTOS and *Bitumen Judaicum*, Offic. *Jew's pitch*. The *asphaltum* of Dioscorides, and *bitumen Judaicum* of the shops, called *karabe* and *gummi funerum* by Serapion, and by others *mumia*, is a solid, brittle, ponderous substance, of a red, blackish, or dark colour, easily inflammable, and of a strong bituminous smell, especially when warm, and fusible by fire. It is found in several parts; but the best is that which comes from Judæa, where it is gathered on the Dead-Sea, called from hence the *Lake Asphaltites*. It is probable that a great quantity of this bitumen rises from the bottom of that lake to the surface of the water. At first it is so soft, viscid, and glutinous, that it cannot without difficulty be separated from any part which it touches, but in time it grows harder than pitch; and, from the place where it is found, it is called *karabe* of Sodom; *karabe* being often used by the Arabs to denote any solid bitumen, and the Dead Sea being the lake where Sodom stood. The names of *gummi funerum* and *mumia* were given it, because the common people among the Egyptians used it in embalming and preserving dead bodies. The true *bitumen Judaicum* is seldom brought to us; for Dioscorides directs us to make choice of that which shines like purple, and to reject the black kind as being foul, and of small value; but all we see of that kind is black: though even that, when broken in pieces, appears, against the light, to be of a saffron-colour; and therefore it is possible this may be the same kind recommended by Dioscorides, only boiled to a hard consistence in brass kettles, before it is sent to us.

It is of a discutient, emollient, and agglutinating quality. It dissolves coagulated blood, and promotes the menstrual discharge. It is an ingredient in the Venice treacle, and in the embalming powder of Charas. *Geoffroy*.

ASPHALTUM, is also a bituminous stone found generally near the ancient Babylon, and is used in the composition of cements for joining stone or brick-work under water, being impenetrable. A mine of this was found since the beginning of this century, in the county of Neufchatel in Switzerland.

This mineral *asphaltum* has several properties; 1. Being prepared with other matters, it makes an excellent cement, which neither the air can corrupt, nor water penetrate; 2. With the oil of it, which is easy to extract, is made a sort of pitch, proper to caulk ships and vessels with, both for sea and rivers, and preserves them better from worms, and more effectually resists the impressions of salt or fresh water than any other caulking commonly used; and with this it seems of late, the French caulk much of their shipping, to their great advantage; 3. Finally, its oil used alone, or mixed with some topical remedies, has several particular properties, which make it to be used with success in several medical and chirurgical cases, for the cure of several external distempers, especially ulcers, and all cutaneous diseases.

The *asphaltum* of Switzerland differs from that of Judæa, in that it is of a dark colour, like roasted coffee, more mixed with earth, and less shining. By its smell and weight it resembles very much the pissasphaltum of the ancients, which is a fossil pitch.

It is very probable that the bitumen, with which Herodotus, and all the ancients after him, thought they had made the cement of the stones of the celebrated walls of ancient Babylon, which were reckoned among the seven wonders of the world, was nothing but the *asphaltum* of Lydim, a valley near Babylon, which was simply called bitumen, on account of the bituminous and oleaginous quality of the cement which they made with it.

The place in the county of Neufchatel, from whence *asphaltum* is taken, is a mountain called Val-Travers. M. de la Sablonniere, who has still the exclusive privilege of importing it into France, duty free, gets large

quantities of it every year from the mine. Besides the above-mentioned uses it is put to, they make particularly a perfume of it, by sprinkling it on live coals. This perfume is excellent for the cure of rheumatic pains, and for purifying stables from bad air, occasioned by the distempers of cattle. Several trials have been made of this, which saved the lives of many cattle during the contagious distemper that had began to rage in that country.

ASPIC. There is an oil called by the French oil of aspic, drawn from a plant which C. Bauhine calls *lavedula latifolia*; but to which J. Bauhine gives the name of *pseudonardus*, and the French that of *aspic*. This plant is commonly found in all parts of Provence; and when it produces its flowers, they put them, when almost dry, into a large still, with a great deal of water. After a maceration of some days, they distill the whole, upon which there comes over, along with the water, an oil of a yellowish, or amber colour; and this is the oil of *aspic*, pure and unadulterated, as it ought to be. The flowers are to be chosen for this purpose, rather than any other parts of this plant, because they contain the largest quantity of essential oil; and, indeed, upon strict observation, we find that the cup of the flower contains almost all the oily parts of the plant. *Mem. de l'Acad. 1715.*

The oil of *aspic* is used by painters in the mixing of colours, farriers, and other artificers; and is likewise of use in medicine. It is very inflammable, and when once on fire, it is almost impossible to extinguish it.

ASS, a well-known animal, which, though slow, lazy, and dull, is patient, proper to work hard, and to carry or drag heavy weights. The largest and strongest of those animals are chosen for stallions, to leap mares, which are designed in studs for breeding mules; and some of those mules are so highly valued, that they are sold even dearer than the finest horses.

ASSA-DULCIS. See BENZOIN.

ASSA-FETIDA, the concrete juice of the root of the Hingisêh, or the *assa-fetida* plant. *Kamp. Amant Exot.* It is brought to us in large masses, from Persia and the East-Indies. It is a compact, gummy-resinous substance, soft and pliable like wax while new, composed of various little shining lumps or grains, which are partly of a whitish colour, partly reddish, and partly of a violet hue. It smells like garlic, but much stronger, and has a bitter, acrid, biting taste. Those masses are accounted best, which are clear, of a palish red, and variegated with a great number of elegant white tears. When it first exudes from the wounded root, it is liquid and white, like milk; but upon being exposed to the air, grows of a brownish colour, and gradually acquires different degrees of consistency. It loses with age of its smell, and likewise of its strength, a circumstance to be particularly regarded in choosing this medicine. The purest white tears, being fresh cut, are of a yellowish-white colour, which, in a little time after, changes to a fine red, tending to a violet. This drug does not intirely dissolve, either in an aqueous or a spirituous menstruum, but somewhat more is taken up by the former than by the latter. Digested in proof spirit, a turbid solution is obtained, which passes the filter, and upon examination is found to participate largely of the *assa fetida*. With rectified spirit, a transparent tincture is extracted, which smells very strong, but does not appear to hold so much of this juice as the former. Put on a red-hot iron, it melts, emits a strong smelling fume, catches flame, and burns almost intirely away, leaving but few ashes.

Assa fetida is an excellent remedy in all hysteric disorders, whether only smelled to, or mixed with what is taken inwardly. It is also reckoned a good sudorific, and strengthener of the stomach. The dose is from twelve grains to half a dram, but with a view to the stomach only, it must be given in smaller doses. Externally it is a good rescolvent. *Geoffroy.*

ASSAYING, a corruption by the workmen of the word *assaying*, derived from the French *essayer*, to try, is the art of separating metals, semi-metals, sulphurs, and mineral salts from each other, and from other bodies mixed with them, so that it may appear what quantity

there was originally of each in the body under trial, or what benefit may be reaped from the extracting of it.

All minerals are the objects of this art; for the bodies aforesaid being seldom found naturally pure, and under their true form, but most commonly mixed and confounded with each other a thousand different ways, and with many kinds of earth and stones, it is proper that the workman should know the nature of all these things, to be able to determine what is requisite for the separation of them.

Method of ASSAYING gold and silver ores.

Take a penny-weight of silver ore reduced to fine powder; and put half an ounce of lead, cleared of its silver, into a flat assay crucible under a muffle in the testing-furnace, with a gentle heat, till the lead has imbibed the powdered ore, at least its metallic part, and separated the more stony matter, in form of a glassy scoria, at the top. Then take out the lump of lead, impregnated with the silver of the ore, and place it upon the test, which has been heating, or nealing, all this while under the muffle; and working with a proper degree of heat, till all the lead is either evaporated, vitrified, or sunk into the test, there will remain a little bead or grain of silver behind; which grain or bead being exactly weighed, and compared with the original weight of the ore, gives the proportion of silver contained in the ore, or determines its richness; and the same method is equally applied to gold ores, sand, or any other matters containing gold, silver, or a mixture of both.

This operation is usually called testing, or cupelling; and exhibits almost the whole art of the assay-master, or refiner. We see the process consists of two parts; viz. imbibition and separation; for this lead is first made to drink in all the silver from the ore, and then the same lead is intirely separated from the silver. And in this manner also are assays taken of silver coin, or any mixtures of the nobler with the ignobler metals: for, when the operation is exactly performed, no other metals, besides gold and silver, will be left upon the test.

The physical reason of the present process deserves to be inquired into. The laws or principles whereon it depends are these: 1. When the imperfect metals, or other minerals, are added to melted lead, some of them will not enter into it, but remain floating on its surface, in form of a hard scoria; which is the case with iron. 2. Others enter it, but gradually emerge again; as tin. 3. Others totally exhale, as regulus of antimony and arsenic. 4. Others again burn to ashes, or run into glass, along with the lead, as does copper. But, 5. neither silver nor gold, is capable of flying off, burning to ashes, or turning to glass, by being detained in melted lead: whence these two metals, of course, remain pure, and separated from all the rest, at the end of the operation. And then we find, that the gold and silver remain, all the time, mixed among the lead, without going into glass, continually sunk down from the shelving sides of the test, towards the bottom of the hollow, along with the lead, which being at length totally consumed, and the fire unable to keep silver or gold melted, without some addition of lead, the silver and gold, if any, necessarily grow rigid, and fix in a small grain at the center of the test.

Method of separating gold from silver by quartation.

Take a mixed mass of gold and silver, melt it with three or four times its own weight of pure silver, and, when cold, beat it into a thin plate, which put into a glass of proof *aqua fortis*, set in warm sand. By this means the silver will be soon dissolved, and the gold precipitated to the bottom in a black powder. Decant carefully this solution of silver, and add a little fresh *aqua fortis* to the gold, setting it in a heat somewhat stronger than before, in order to dissolve any remains of silver in the gold-powder. Then, the *aqua fortis* being again decanted, wash the gold well in several parcels of fair water. Put the gold powder into a small cupel, and place it under the muffle in the setting-furnace till it become yellow. Then, weigh the gold, in order to determine

termine its proportion to the silver. Lastly, precipitate the silver out of the *aqua fortis* by suspending a copper-plate therein, wash the calx, and reduce it to its native form in the same manner.

The reason for adding three or four times the quantity of silver, in proportion to the mixed mafs, is for fear the mafs should contain too much gold to be fit for the operation; or to spread the gold contained in the mafs, and diffuse it so thinly, that it may not defend the silver, as it would otherwise do, from the action of the *aqua fortis*. And, upon account of this addition, it seems to be that the operation is called *quartation*.

But there are certain workmen of late who have the method of separating gold from silver, to much greater advantage, without the use either of *aqua fortis* or *aqua regia*, but barely by a dextrous application or management of the fire; at least without any costly additions. This method is kept a secret; but may, perhaps, be no other than that published by M. Homberg, in the *Mem. de l'Acad. Roy. des Sciences*, which consists in fluxing the mixed mafs of gold and silver with equal parts of rough nitre and deprecipitated sea-salt, placed at the bottom of the melting-pot; whereby the operation in the large way may be finished in a quarter of an hour; the gold by this means falling to the bottom, and leaving the silver suspended or detained in the salts.

Though this art more particularly concerns those tradesmen and artificers who purchase those metals for sale, and refine them to the proper standard, for their working up into utensils; yet, as our silver and gold are imported by merchants, from foreign countries, it is requisite that they should know something of the nature of *assaying*; for in their dealings in bullion or silver, or in foreign coins, they may not always have justice done them, unless they deal with our refiners in Foster-lane; whom, I will presume to say, are gentlemen behind none in the kingdom, for distinguished honour and integrity in their way of business.

Nor is this matter of *assaying* any way troublesome, expensive, or mysterious; a small apparatus will perform the whole; and, for its curiosity, might prove an agreeable amusement, was there no private advantage likely to attend it.

The methods employed for the purposes of *assaying* are now all over Europe pretty much the same; but should never be trusted, unless, at least, two or three experiments made at the same time, by the same, or different persons, agree in the same report.

And, perhaps, in all natural philosophy, chemistry, and metallurgy, there is not an experiment which requires greater skill and accuracy than these experiments in the art of *assaying*, so as to be depended upon: nor, indeed, can such precision as is here required be well expected, but from those who are acquainted with the rapacious nature of many volatile mineral fumes; and the methods of so retaining them, to prevent their carrying off the nobler metals upon the test.

To assay in perfection requires also a knowledge of the relations and differences of all the metals with regard to each other, and particularly to lead and antimony. As this art therefore requires so much judgment and delicacy, in order to practise it with success; hence doubtless proceeds the difficulty we find in procuring a true assay to be made upon any uncommon ore or mineral substance; for the art of *assaying* is extremely backward in admitting of improvements, as if it were to descend unaltered from one generation to another.

Was the due use and importance of this art more generally attended to, the proprietors of all kind of mines and mineral matters, and all who are any way concerned in metals, would assuredly reap their advantage by it. For this is certain, that if, by the repeated assay, the ore promiscuously taken yields such a quantity of metal, the same quantity in proportion may be got out of the same ore, in the large way of working: so that the accurate assay is a criterion to the private gentleman, to know whether his workmen are skilful in this operation, or whether they defraud him in the produce of his metal.

It is however true, that if the same method of operation is not made use of in the large way of smelting ores, as is practised in making of the small assay, the yield of

the ore in the large way may not come up in quantity in the proportion to what the assay indicated: this is a known maxim to those who have been concerned in large works. But, if the same method of working is practised in the large way as is done in the assay, the produce of metal in the one will be equal to that in the other. Nay, where there is a great body of ore, as a ton smelted together, it is rather reasonable to think, that a greater quantity of metal, especially of gold or silver, will be produced in the larger way, than in proportion to the small assay; for, if the identical method of operation is practised in the one way as in the other; that is, if the same degree of strength in the application of fuel is duly administered, in proportion to the quantity of matter, &c. the same fluxes used, and the same art exerted in all respects in the great way as in the assay, the yield of metal in the large way cannot be less than what the assay made in the same way exhibited.

To judge otherwise seems to subvert one of the fundamental and immutable principles of nature; as that would be to say, that the same cause will not eternally produce the same effect.

It is rare, indeed, that the same way of working is practised in the great way, as is done in the assay, it being too expensive; and, therefore, from the effect being different, some are led into an egregious mistake, in regard to those operations. It is an advantage to the sellers of ores, to dispose of them according to the most accurate assay that can be made; but it is the reverse to the purchaser, if he buys them by such assays, and works them in great works by a different process, which will not hold him near the like quantity of metal.

When gold and silver are in their full purity, they are rather too soft and flexible, either to be wrought into utensils or coin, without being hardened with an alloy of some baser metal.

To prevent the abuses which some might commit in the making of such alloys, the government, in most countries, have ordained that there shall be no more than a certain proportion of baser metal added to a certain quantity of pure gold or silver, to make them of the fineness of what is called their respective standards.

In England, a pound weight of standard-silver is eleven ounces two penny-weights of fine silver, and eighteen penny-weights of fine copper, which together make twelve ounces, or one pound troy-weight.

Of the troy-weights.

14 ounces	8 penny-weights	= 1 lb. avoirdupoise-weight,
12 ounces		= 1 lb. troy-weight.
20 dwts,	or penny-weights	= 1 ounce.
24 grains		= 1 penny-weight.
20 mites		= 1 grain.
24 droits		= 1 mite.
20 periot		= 1 droit.
24 blanks		= 1 periot.

Of the gold-standard.

One pound, or one ounce of gold, must contain twenty-two carats of fine gold, one carat of fine silver, and one carat of fine copper, which together make twenty-four carats, or one pound, or one ounce of troy-weight. The carat is a term used by refiners, whereby they certify a certain composition of weights used in assaying and computing of standard gold; and this carat contains either the twenty-fourth part of a pound, or the twenty-fourth part of an ounce troy.

A pound carat is thus divided.

12 ounces	= 24 carats.
4 grains	= 1 carat.
4 quarters	= 1 grain.
10 dwts troy	= 1 carat.
2 dwts 12 grains troy	= 1 grain.
15 grains troy	= 1 quarter-grain.

An ounce carat is thus divided.

1 ounce troy	= 24 carats.
4 grains	= 1 carat.
4 quarters	= 1 grain.
20 grains troy	= 1 carat.
5 grain troy	= 1 carat-grain.

And,

And, according to the laws of England, all sorts of wrought plate in general ought to be made to the said standards of gold and silver; and the current price of such standard-gold and silver is the common rule whereby to value bullion, whether it be in mafs, bars, duft, or in foreign coin; but the true value of bullion gold, or silver, cannot be known without being affayed, for the use of an assay is to discover how much allay there is in any bullion, more or less than there is in the standard. If there be less allay in it than there is in the standard, so much as there is less, makes the bullion so much finer, better, and more valuable than standard. If, on the other hand, there be more allay in the bullion than there is in the standard, such bullion will be coarser or worse, and consequently, will be so much less valuable than standard.

The method of getting bullion assayed is thus: you take a slip of paper, about five or six inches long, and about four or five inches broad, and put into it a few grains (the usual quantity) cut off the bullion which is to be assayed, and fold it up, turning in the sides and corners, to prevent its dropping out, and underneath you write down the owner's name.

This paper is carried to his majesty's assay-office in the Tower, or to the company's office in Goldsmith's Hall, or to some noted experienced assay-master. After the same is assayed, if you ask for it in the owner's name, it will be returned to you again, with the gold or silver in it: for which you pay the customary fee.

When you come to open the paper, you will find the assay-master's name and report, wrote by him, much after the following form, viz.

A ——— B ———
Silver for an assay, March 5th, 1766,
W. 12 dwts. Ob.

A ——— B ———
Gold for an assay, March 10th, 1766.
B. 2 gra. $\frac{3}{4}$.

The assay-master always makes his reports of silver in ounces, penny-weights, and half penny-weights; and of gold in carats, carat-grains, and the fractions of a carat-grain; and they commonly write down the quantities, with the numerical letters of the secretary's handwriting. It must be observed, also, that *B* stands for better than standard; *W* for worse; *Ob.* for half penny-weight, and *Sta.* for standard.

When the report of the assay-master is made, and the price of standard-gold and silver is known, it will be easy to judge of the price of that which is better or worse than standard, and to cast up any quantity accordingly. See the articles, ALLAY, GOLD, and SILVER.

ASSAYING of weights and measures, is the examination of weights and measures, by clerks of the markets.

ASSAYER of the king, an officer of the king's mint, for the trial of silver; he is indifferently appointed between the master of the mint and the merchants that bring silver for exchange. 2 Hen. VI. cap. 12. Vessels of gold shall be assayed. 28 Edward I. cap. 20. and 13 Car. II. cap. 5.

ASSAYERS of plate made by goldsmiths, &c. These are for assaying and marking thereof; of whom with their fees, and how the assay-offices are regulated by statute, see 12 Geo. II. cap. 26. and article GOLD-SMITHS.

ASSELANI. See ASLANI.

ASSENT, or CONSENT. To a legacy of goods, the assent of the executor is necessary, before the legatee may take the same; but to a devise of lands that are freehold, it is not required.

The assent of an executor to a devise of a legacy, or of any personal thing, is so necessary, that if the legatee to a devise take the thing without the delivery and assent of the executor, he may have an action of trespass against him. Keilw. 128. Dyer.

But such an assent will not make a devise of a personal thing good, which is void in itself; as for instance, the testator having a term of years, as executor to another, devised it to a stranger, and made his son executor, and died; the devisee entered by the assent of the son, and afterwards he, as executor to his father, re-entered

upon the devisee; and adjudged, that his entry was lawful, because the devise to this stranger was void, for an executor cannot devise that to another which he hath as executor, because he hath it not in his own right, but for the use of his testator; therefore an assent to a void devise must be also void. Plowd. Comm. 525.

The common law takes notice of the assent of the executor to the legacy, and doth give him time to consider of the value of the goods, and state of the debts of the testator, that he may pay a legacy with safety; the executor being to pay debts before legacies. Perk. 570.

No property can be transferred to the legatee, without the assent of the executor; but if the executor doth once assent to the legacy, the legatee hath such a property vested in him that he may take it, though the executor revokes his assent afterwards. And there may be an assent implied, as well as express; as if the executor offers the legatee money for what is bequeathed him; or directs others to the legatee to buy, &c. Plowd. 543. 4 Rep. 28.

In trespass, &c. the case was, that the testator being possessed of lands, which he held upon several leases, some of which were in the diocese of the archbishop of York, and some in peculiar, devised all those leases to his son, and made his daughter executrix, who was then an infant, the mother took out administration *durante minore etate* of the executrix in the peculiar, where her husband died, and granted the residue of the term of the lands there to the plaintiff; the question was, whether the assent of an administratrix, *durante minore etate*, was good to the devise of a term, or whether the assent of the executrix, though an infant, was necessary; the chief justice Anderson held, that an infant at the age of eighteen might assent; but the court doubted, whether the assent of an administratrix was good or not. Cro. Eliz. 719.

The testator being possessed of a term of years, devised the same to his daughter for so many years as she should live, remainder to J. S. and made his daughter's husband executor, and died; the executor some time afterwards declared, that if his wife was dead, his estate in the lands was ended; adjudged, that this was sufficient assent to make him take the term, in right of his wife, as a devisee; but if he had not made such a declaration, he might have taken it as executor, and not as a devisee, and by consequence might have enjoyed it, if he had survived his wife. March 137. Adjudged, that the spiritual court may compel an executor to assent to a legacy, and so may a court of equity. March 97.

ASSESSORS, those that assess public taxes. Two inhabitants in every parish were assessors for the royal aid, to rate every person according to the value of his estate. Stat. 16 and 17 Car. II. There are assessments of parish duties, for raising money for the poor; repairing of high-ways, &c. made and levied by rate on the inhabitants; as well as assessments of public taxes, &c.

ASSETS. All those goods and chattels which belonged to the testator at the time of his death in any part of the world, and which do come to the hands of the executor, shall be assets (from the French *assez*, enough) or sufficient goods and chattels to make the executor chargeable, as far as the said goods and chattels extend, to a creditor or legatee. 6 Rep. 47. *Termes de la ley*.

Assets are real or personal; where a man hath lands in fee simple, and dies seized thereof, the lands which come to his heir, are assets real; and where he dies possessed of any personal estate, the goods which come to the executors are assets personal. Assets are also divided into assets *per descent*, and assets *entre maines*; assets by descent is where a person is bound in an obligation, and dies seized of lands which descend to the heir, the land shall be assets, and the heir shall be charged as far as the land to him descended will extend: assets *entre maines*, is when a man indebted makes executors, and leaves them sufficient to pay his debts and legacies; or where some commodity or profit ariseth to them in right of the testator, which are called assets in their hands. *Termes de la ley*.

Formerly, in the case of assets in the hands of an heir, the law was, that if the heir had sold or alienated the land before the bond was put in suit, (the ancestor having entered into a bond, and died seized of lands in fee)

the debt was lost. To prevent this, by statute 3 and 4 *Will. and Mary, cap. 14. sect. 5.* it is enacted, that "where any heir at law shall be liable to pay the debt of his ancestor in regard of any lands or tenements descending to him, and shall alien the same before any action brought, such heir at law shall be answerable for such debt in an action of debt, to the value of the land by him aliened; in which cases all creditors shall be preferred, as in actions against executors; and such execution shall be taken out upon any judgment obtained against such heir, to the value of the land, as if the same were his own debt, saving that the lands, *bona fide*, aliened before the action brought, shall not be liable."

Sect. 6. "Where any action of debt upon specialty is brought against any heir, he may plead *riens per descent* at the time of the original writ brought, or the bill filed; and the plaintiff may reply, that he had lands, tenements, or hereditaments, from his ancestor before the original writ brought, or bill filed; and if upon issue joined, it be found for the plaintiff, the jury shall inquire of the value of the lands descended, and thereupon judgment shall be given, and execution awarded; but if judgment be given against such heir by confession of the action, without confessing the *assets* descended, or upon demurrer, or *nihil dicit*, it shall be for the debt and damages, without any writ to enquire of the tenements descended."

Sect. 7. "Every devisee made liable by this act shall be chargeable in the same manner as the heir at law, notwithstanding the lands devised shall be aliened before action brought."

By the common law, a trust of lands, descending upon an heir, was not *assets* even in equity; but now by *stat. 29 Car. II. cap. 3.* it is enacted, that if any *celsui que* trust die, leaving a trust in fee simple to descend to his heir, such trust shall be taken to be *assets* by descent, and the heir shall be chargeable with the obligation of his ancestors, by reason of such *assets*, as fully as if the estate in law had descended to him, provided that no heir shall by any kind of plea or confession of the action, or suffering judgment by *nient dedire*, or any other matter, be chargeable to pay the condemnation out of his own estate, but execution shall be sued of the whole estate, so made *assets* in his hands by descent, in whose hands soever it shall come after the writ purchased.

"Estate *pur auter vie* shall be *assets* in the hands of the heir, if it come to him by reason of a special occupancy, and where there is no special occupant, it shall go to the executors or administrators of the party that had the estate thereof by virtue of the grant, and shall be *assets* in their hands."

If a reversion upon a lease for life, with rent reserved, descends to the heir, it is good *assets*. *Br. Assets per descent. pl. 23.*

An annuity is no *assets*, for it is only a *chose in action*. *Br. pl. 26.*

If a manor descends to an infant, and after a tenancy escheats, such land escheated shall be *assets* by descent. *Finch 17. b.*

As to *assets* in the hand of an executor or administrator, all goods and chattels, debts, &c. that are recovered by the executor by action, after the death of the testator, shall be accounted *assets*; but not before they are recovered. For if the executor do never recover, or get a debt into his possession, he shall never be charged; provided he hath used his utmost endeavour to recover it, and cannot do it. *1 Rep. 98. Office of Ex. chap. 6. p. 92.*

Damages recovered for goods taken away in the life of the testator, shall be *assets*. *Lit. 192. 1 Inst. 124. a.*

If an obligee or creditor is made executor, the debt is *assets*; but he may pay himself before any other in equal or inferior degree. *1 Inst. 264. Office of Ex. chap. 2. p. 43, 63.*

If an executor of his own wrong, to whom twenty pounds is owing, doth seize goods to the value of twenty pounds intending to pay himself a debt of that value, this shall be *assets* in his hands to make him chargeable to any creditor or legatee. *5 Rep. 30.*

Though a plantation be an inheritance, yet, being in

a foreign country, it is a chattel to pay debts, and a thing that is testamentary. *Vent. 358.*

A man mortgaged his estate for a term of years; adjudged, that the equity of redemption is *assets*, and so is a term for years to attend the inheritance; so, if the mortgager pays the money to the heir of the mortgagee, he shall not take it as heir, but it shall be *assets* in his hands. *3 Leon. 32.*

Where a debt due to the testator is certain, as it is always by bond, there a release of that debt makes it *assets* in the hands of the executors, because it shall be intended, that he would not have made the release unless the money had been paid to him, or unless he had otherwise been satisfied; therefore where an infant was executor, and the administrator during his minority, had received six hundred pounds, due to the testator; and when the infant-executor came of age, and had proved the will, he released the administrator of all actions; it was adjudged in an action of debt brought against him, that the six hundred pounds which was certain, and which was now released, shall be *assets* in his hands; for it shall be intended, that he received it from the administrator, otherwise he should not have given him a release. *Owen 36.*

There was a bond of a hundred pounds made to the testator for performance of covenants, which afterwards were broken, and the executor put the bond in suit, and pending the action, submitted himself to arbitration, and the obligor was awarded to pay the executor seventy pounds, and that upon payment of the money he should release the bond; all which was done; and in an action brought against him, it was adjudged, that he shall be answerable for *assets* to the value of a hundred pounds, for so was the bond; and though he was compelled by the award to release the bond, yet it was his own act to submit to the arbitration. *3 Leon. 51.*

Judgment was had against one Vaughan, who afterwards died intestate, having first made a fraudulent gift of his goods to his daughter, who by virtue thereof gave them to the defendant, and having gotten the goods in his possession, took out administration to the said intestate; afterwards a *scire facias* was brought against him as executor to Vaughan, and this was to have execution of the said judgment, who pleaded *riens entre mains*; and all this matter being found specially, the plaintiff recovered against him; for by his intermeddling with the goods, he was an executor *de son tort*, because the gift to the daughter being fraudulent and void, as to creditors, she could not give him any authority to possess them, therefore he was a trespasser, and they were *assets* in his hands, and his subsequent administration did not purge that wrong; therefore a creditor may sue him as executor *de son tort*, or he might have sued him as administrator. *Cro. Eliz. 810.*

Executor *durante minore etate* of an infant, who after came of age, and proved the will, and left several goods of the testator in the hands of the said executor, yet these shall be adjudged *assets* in his hands; now he had proved the will, though he never had the possession, because he might have recovered them of the executor after he came of age. *1 Rol. Abr. 921.*

Debt against an executor, who pleaded *plene administravit*; the plaintiff replied, *assets die impetrationis brevis*; upon which they were at issue, and the proof for the plaintiff was, that on the same day a hundred pounds was paid to the defendant in the prerogative-court, and that presently, by order of the said court, the same was paid by the defendant to another creditor of his testator; adjudged, that because the money was once in the hands of the defendant as executor, &c. it shall be accounted *assets*, though paid over to another creditor; but the defendant might have helped himself, upon pleading this matter specially, but not upon *plene administravit*. *Dyer. 20.*

The testator being possessed of several goods, made M. R. his executrix, and died; the executrix made a fraudulent gift of the goods, but continued in the possession of them, and afterwards she married the defendant, and died; and in an action of debt brought against him as executor *de son tort*, the question was, whether

goods were *assets* in his hands, he having paid debts and legacies; adjudged that they were; it is true, the gift, though fraudulent, is good against all but creditors; but if in respect to them it is void, as certainly it is, then the executrix had a good title to them, notwithstanding her fraudulent gift; and if so, then her husband having possessed the goods, and paid legacies, &c. he is liable as *executor of his own wrong*, and they are *assets* in his hands. *Cro. Eliz.* 405.

Money decreed in a court of equity by reason of any executorship, and money arising by sale of lands by executors, and even damages recovered by an executor, shall be *assets*, and so shall the interest of money lent by the executor, if it was the testator's money; it is true, it hath been argued to the contrary, because the testator lends the money at his own peril; therefore he being to bear the loss, it is reasonable he should have the profit; but now it is held otherwise. *Moor* 858.

ASSIENTO, a contract which for a limited time subfisted between the king of Spain and the English South-Sea company, for furnishing the Spanish American settlements with a certain number of slaves from the African coasts. This contract expired in 1744.

This contract had shifted hands from time to time. The Genoese, by their ill method of management, made nothing of it; nor did their successors, the Portuguese. After them it fell into the hands of the French, who made so much of it, that they were enabled, by a computation made from the registers in Spain, to import into the French dominions no less than 204,000,000 of pieces of eight. Yet they at length over-glutted the market, and became sufferers, towards the conclusion thereof.

Upon the *assiento's* falling into English hands, we had not been able to make any great advantage by it, on account of the unsettled affairs in Europe for many years past, and our misunderstanding with the court of Spain, during the long Walpolian administration.

The South-Sea company were obliged to import 4,800 negroes a year, for which they were to pay per head at the rate settled with the French company; but were obliged to pay only half that duty, during the twenty-five first years, for every negro they should import above the number 4,800 stipulated by the treaty.

The forty-second article of that treaty, which is the last, and, perhaps, the most considerable of all, was not in the treaty made with the French. By that article leave is given to the English assentists, or contractors, to send yearly into Spanish America, during the whole time the treaty was to continue, a ship of five hundred tons, laden with the same sorts of merchandizes which the Spaniards used to carry thither, with liberty to sell and dispose of them, with the concurrence of the Spaniards, at the fairs of Porto-Bello and Vera Cruz.

One may safely assert, that neither the furnishing the Spaniards with negroes, which is the main object of that treaty, nor the several other articles, by which many privileges were granted to the South-Sea company, did prove so profitable to it, as that liberty alone granted to the English, against the ancient policy and the usual jealousy of the Spaniards, with regard to their American trade.

Five more articles were afterwards added to that treaty of *assiento* with the English, in order to explain some of the old ones.

By the first it is agreed, that the treaty shall be reckoned to commence but in the year 1714. By the second, that the English shall be suffered to send their merchant-ship, though the Spanish fleet or galleons, should not fail to America. By the third, that, during the first ten years, that ship might be of six hundred and fifty tons. Finally, by the two last articles, it is agreed, that the merchandizes which might remain, after the sale of the negroes, should be sent back into Europe, after the negroes had been landed at Buenos-Ayres; and that, if the negroes were designed for Porto-Bello, Vera-Cruz, Charthagena, and some other part of Spanish America, they should be carried into some of the Antilles islands belonging to the English, and that it should not be lawful to send any into the South-Sea.

The method of rating and paying the *assiento-duty* for

every negro; when the ship arrived in the American dominions of the king of Spain, was the same with regard to the English, as was practised with the French; that is, when the negroes were landed, the Spanish officers, in concert with the company's factor, separated them into four classes: in the first, they put together all those negroes, of both sexes, who were in perfect health, and from fifteen to thirty years old. Afterwards they separated the old men and women, and the sick, and made a second lot of them. Next followed the children of both sexes, from ten to fifteen years old; and lastly, those from five to ten.

The separation thus made, they proceeded to estimate the value of the negroes; reckoning every negro of the first class, being in perfect health, as a head, for which the full duty of thirty-three piasfers and a third was to be paid. The old and sick, who made up the second class, were rated at three-fourth of a head, and the duty was to be paid accordingly. The children of the third class were reckoned at three for two heads, and those of the fourth, at two for one head; and, according to that estimation, the king's duty was paid.

So that of a cargo of six hundred and ten heads of negroes, among whom there were two hundred and fifty in health, and of the proper age, sixty sick or old, one hundred and fifty children from ten to fifteen years old, and one hundred and fifty from five to ten, the king received duty but for four hundred and seventy.

ASSIGN, is to appoint, or transfer, or set over a right to another. He that *assigns* is called the *assigner*, and he to whom the thing is *assigned* is named the *assignee*.

ASSIGNEES of bankrupts, *how chosen, and their power and duty.* By 5 Geo. II. cap. 30. sect. 26, 27, when any commission of bankrupt is issued out, the commissioners therein named, or the major part of them, shall forthwith, after they have declared the person bankrupt, cause notice to be given in the London Gazette, and shall appoint a time and place for the creditors to meet; which for the city of London, and all places within the bills of mortality, shall be at Guildhall, in order to chuse an *assignee*, or *assignees*, of the bankrupt's estate and effects; at which meeting the proof of any creditor's debt, (that shall live remote from the place of the said meeting) shall be admitted by affidavit, or if Quakers, by affirmation, or if from abroad, by letters of attorney; and all creditors who shall so prove their debts at this meeting, and whose debt amounts to ten pounds or upwards, shall be qualified to vote in the choice of *assignees*, and he or they that shall be so chosen by the major part in value of the creditors, then proving their debts, shall have an *assignment*, from the commissioners, or the major part of them, of the bankrupt's estate and effects.

SECT. 30. The commissioners have power immediately to appoint one or more *assignees*, if they see cause, for the better securing and preserving the bankrupt's estate, which *assignee* or *assignees* may be removed or displaced at the meeting of the creditors for the choice of *assignees*, if the major part of them met and duly qualified shall think fit, and such *assignee* or *assignees* as shall be so removed or displaced, shall within ten days after notice given in writing by the *assignee* or *assignees* chosen by the creditors of the said choice, make an assignment and delivery to the said *assignee* or *assignees*, of all the bankrupt's estate and effects which shall have come to their hands and possession, on penalty of two hundred pounds each, to be distributed among the creditors, in the same manner as the bankrupt's estate shall be. And the lord chancellor has power, on the petition of any creditor, to remove such *assignees* as shall have been chosen by the commissioners, to vacate the assignment, and to cause a new one to be made.

Assignees have power to order the bankrupt's attendance on them as often as they think convenient for the benefit of the estate, and may have some skilful accomptant to settle his books and accounts, and employ some faithful person, to collect and get in the debts; but for this last they ought to have security.

SECT. 38. *Assignees* may bring actions at law, without the consent of the creditors; though if the suit in law is a matter of consequence, or which may produce a suit

in equity, they should summon all the creditors to a meeting, by notice in the London Gazette, and lay before them the true state of the case, and take the consent of the major part in value of the said creditors in writing, to the bringing such suits, and that a sufficient sum remain in the *assignees* hands to defray the charges; and in case they apprehend that they shall not have sufficient, they may take an agreement under the creditors hands to indemnify them, and oblige themselves every one to pay his share, in proportion to their respective debts; for *assignees* are not obliged to bring any suit in law or equity (though the creditors vote that they should) unless they are indemnified, where there is an appearance of a hazard.

Sec. 34. And the *assignees* may, with consent of the major part in value of the creditors who shall have duly proved their debts, and be present at any meeting of the said creditors, pursuant to notice to be for that purpose given in the London Gazette, submit any difference or dispute between the *assignees* and any person or persons whatsoever, relating to the bankrupt's effects to arbitration, the arbitrators to be chose by the *assignees* and the major part in value of such creditors, and the party or parties with whom they have the difference, and to perform the award of such arbitrators, or otherwise to compound and agree the matters in dispute, in such manner as the *assignees* (with such consent as aforesaid) shall think fit, and the same shall be binding to all the creditors.

Sec. 35. The *assignees*, by and with the consent of the major part of the creditors in value, who shall be present at a meeting to be had for that purpose (of which notice shall be given in the London Gazette) may make composition with any person or persons, debtors or accomplices to the bankrupt, where the same shall appear necessary and reasonable, and to take such reasonable part as can upon such composition be gotten in full discharge of such debts and accounts.

Sec. 28. *Assignees* should be careful in examining the nature of the bankrupt's debts, to prevent the statute of limitation from taking place. Where it shall appear to the major part of the commissioners, that there has been mutual credit given by the bankrupt and any other person, or mutual debts between the bankrupt and any other, at any time before he became bankrupt, the major part of the commissioners, or the *assignees* of the estate, may state the account between them, and one debt may be set against another, and what shall appear to be due on either side on the balance of such account, and on setting such debts one against another, and no more, shall be claimed or paid on either side respectively.

Sec. 32. Before the creditors shall proceed to the choice of *assignees*, the major part in value of the creditors present shall, if they think fit, direct how, and with whom the monies to be received out of the bankrupt's estate, shall remain, until the same be divided, to which rule such *assignees* shall conform as often as one hundred pounds shall be got in.

Sec. 33. *Assignees* are obliged at some time after the expiration of four months, and within twelve months from the time of the commission's issuing, to cause at least twenty-one days public notice to be given in the London Gazette, of the time and place they and the commissioners intend to meet, to make a dividend or distribution of the bankrupt's effects, at which time the creditors who have not before proved their debts, shall then be at liberty to prove them, which meeting for London and all places within the bills of mortality, shall be at the Guildhall, and at such meeting the *assignees* shall produce to the commissioners and creditors then present, just and fair accounts of all their receipts and payments touching the bankrupt's estate and effects, and the particulars of all that shall remain outstanding, and shall, if the major part of the creditors then present require it, be examined upon oath before the commissioners touching the truth of such accounts. And the *assignees* shall be allowed and retain all such sums as they shall have paid or expended in suing out and prosecuting such commission, and all other just allowances on their account of being *assignees*; and the major part of the commissioners shall order such part of the neat produce of the bankrupt's estate, as by such accounts or otherwise shall appear to be in the hands of the *assignees*, as they

shall think fit, to be divided forthwith among such of the creditors who have duly proved their debts under the commission in proportion to their several and respective debts, and they shall make such their order for a dividend in writing under their hands, and shall cause one part of such order to be filed amongst the proceedings under the commission, and shall deliver unto each of the *assignees* a duplicate of such their order likewise; under their hands; which order of distribution shall contain an account of the time and place of making such order, and the sum total or *quantum* of all the debts proved under the said commission, and the sum total of the money remaining in the hands of the *assignees* to be divided, and how much in particular in the pound is then ordered to be paid to every creditor under the commission; and the said *assignees*, in pursuance of such order, and without any deed or deeds of distribution to be made for that purpose, shall forthwith make such dividend and distribution accordingly, and shall take receipts in a book to be kept for that purpose from each creditor, for the part or share of such dividend or distribution, which they shall make and pay to each creditor respectively, and such order and receipt shall be a full and effectual discharge to such *assignees*.

Sec. 37. And the *assignees* are further obliged, within eighteen months after issuing the commission, to make a second dividend of the bankrupt's estate and effects, in case the whole was not divided on the first dividend, and shall cause notice to be inserted in the London Gazette of the time and place the commissioners intend to meet to make a second dividend, and for the creditors who shall not have proved their debts, to come and prove them, and at such meeting, the *assignees* shall produce upon oath their accounts of the bankrupt's estate and effects, and what upon the balance thereof there shall appear to be in their hands, shall by the like order of the major part of the commissioners be forthwith divided among such of the bankrupt's creditors, as shall have made due proof of their debts, in proportion to their several and respective debts, which second dividend shall be final, unless "any suit at law or in equity shall be depending, or any part of the estate standing out that cannot have been disposed of, or that the major part of the creditors shall not have agreed to be sold and disposed of, in manner aforesaid; or unless some other or future estate or effects of the said bankrupt shall afterwards come to or vest in the said *assignees*," in which case the *assignees* shall, as soon as may be, convert such future or other estate or effects into money in manner aforesaid, and shall within two months next after the same shall be converted into money, by the like order of the commissioners, divide the same amongst the creditors who shall have made due proof of their debts.

If creditors want to inspect the *assignees* accounts, and are refused by them, the court on petition will oblige the *assignees* to shew their accounts according to the direction of the statutes.

If an *assignee* is guilty of a breach of trust, by misapplying the creditors money, or keeping the money in his hands, when he ought to have divided it, the court on a petition and proof being made, will order an account to be taken before the commissioners, and to make a dividend, and if any manifest delay or neglect appears in them, will oblige them to pay interest and costs.

If *assignees* attempt to sell estates at an under-value, or enter into any clandestine agreement either with the bankrupt or any other person, the court, by application, will by order restrain them from selling such estates or interests, or remove them.

If *assignees* have had suits in law or equity, on application to the court, the court will order the commissioners to settle the accounts, allowing them all reasonable costs and charges, and direct the *assignees* to make a dividend of the residue.

The court on a petition will order the commissioners to inquire into the real consideration of debts and notes and of usurious contracts; and will order the *assignees* to be restrained from making any dividend, till the commissioners shall have made their certificate to the court; and if there appears to have been more than legal interest received,

ceived, or unfair transactions, with regard to the obtaining or swelling such debt, the court, on bringing a bill, will by decree reduce such unconscionable demand to the sum which is really due.

If an assignee dies, the trust devolves to the surviving assignee, or to such new assignee as the court shall join to the surviving assignee, if the creditors shall petition for the same; and the executor or administrator of the deceased assignee must pay the money in his hands to the surviving assignee, and such additional assignee (if appointed) is to account before a master in chancery for assets come to his or her hands; because commissioners cannot take an account of assets.

If the bankrupt's real estate is conveyed to assignees, and one of them dies, this is a joint-tenancy, and goes to the survivor; and he may alone sell such an estate to a purchaser; but if both die before any conveyance is made, then the heir at law of the survivor must convey to such new assignee as the court shall appoint, or join with such new assignee in conveyance to a purchaser.

If money is overpaid in pursuance of an usurious contract, the assignees have a right to demand and recover it, notwithstanding the agreement of the oppressed party to allow such payments. The two Cottons became bankrupts, and their assignees brought a bill against Dashwood, as executor of Sir Samuel Dashwood, who had in his life-time, lent several sums to the bankrupts upon bonds bearing six per cent. interest, and had taken advantage of their necessitous circumstances, and compelled them to pay ten per cent. to which they submitted, and entered into other agreements for that purpose, and continued paying at the said rate of ten per cent. from the year 1710 to 1724; it was decreed at the rolls, that the defendant should account, and that for what had been really lent, legal interest should be computed and allowed; and what had been paid, over and above legal interest, should be deducted out of the principal at the time paid, and the plaintiffs to pay what should be due on account; and if the testator had received more than was due with legal interest, that was to be refunded by the defendants, and the bonds to be delivered up. *Lord Talbot*, Mich. Term. fol. 38 to 41. 1 Geo. II. 11 Nov. *Bosanquett v. Dashwood*.

A bankrupt, before he became such, having made a mortgage of his estate, the assignees of the statute bring an ejectment for the recovery of the lands comprized in the mortgage; the mortgagee refuses to enter, but suffers the bankrupt to take the profits, and to fence against the assignees with this mortgage. Lord keeper ordered, the mortgagee should be charged with the profits from the time of the ejectment delivered. *Chapman v. Tamer*. 1 Vern. 276. Mich. Term, 1684.

ASSIGNEE, dying in debt by bond, what recoveries are had. The assignees under a commission taken out against J. S. petitioned that J. N. the daughter and administratrix of J. D. (who was the surviving assignee under the commission) should account before the commissioners, for the bankrupt's effects come to her hands; and an affidavit was made, that J. N. had confessed she believed that her intestate, the assignee, kept the bankrupt's money in a separate bag, with a note in it, shewing it to be such; and also that the assignee left lands of inheritance, descended to J. N. the heir, which would be assets by descent, to answer the covenant entered into by the assignee for himself and heirs, with the commissioners, duly to account for the bankrupt's effects.

But against the petition, it was urged, that this matter was not fit to be ended in a summary way, but by a bill to determine it, for that J. N. the heir and administratrix of the assignee, had made an affidavit, that she never confessed the assignee, her father, kept the bankrupt's money in a separate bag or place, nor did she believe the fact to be so; that the assignee, the father, died indebted by specialty and otherwise several thousand pounds beyond all his assets; that he has paid some bonds, and actions were depending upon others; that it was in her election to prefer which of the specialties she pleased, and the commissioners were not proper to determine in a summary way, whether the payments already made by the administratrix, or which she should make, were, or would be, good and legal; or if they should make such

determination, this could be no way binding to the other creditors; therefore the order now desired, that the daughter and administratrix of the assignee, should account with the commissioners; would be of no use, since the creditors might bring their action, or bill in equity against the daughter and administratrix of the assignee; for which reasons lord chancellor ordered the petition of the new assignees to be dismissed, and directed them to bring their bill. *Ex parte Markland*. 2 Peer Will. 546. Trin. Term. 1729. L. C. King.

Though assignees are generally chose from among the creditors, and those commonly to whom the bankrupt is most indebted, yet they may be made notwithstanding they are no creditors, nor any ways concerned in the commission, provided the major part in value of the creditors appoint them.

And assignees may bring actions for debts due to the bankrupt in their own names, &c. for they shall have the same remedy as the bankrupt himself might have had against his debtors. But if the commission of bankruptcy be not taken out within six years (the time directed by law for suing of debts) then the defendant in an action may plead the statute of limitations: in case the commission be taken out within six years, and the assignment made within that time, the statute preserves the debts by the assignment, it being to relieve creditors against fraud. 2 Cro. 105. 1 Saund. 37. *Jones versus Pope*.

It is a constant practice to make an assignment of the debts and estate of the bankrupt to assignees in trust for themselves (if creditors) and the other creditors; and it has been held, that where a commission of bankruptcy is taken out, the bankrupt's goods do not thereupon belong to the commissioners, for until an assignment thereof is made, the property is not transferred out of the bankrupt; but it is said, the assignee is in by relation from the time of the bankruptcy, so as to avoid all mesne acts, but not so as to be actually invested with the property. 1 Salk. 108, 111.

ASSIGNEES, how removed. By 5 Geo. II. c. 39. s. 31. If an assignment of a bankrupt's estate already made by the commissioners, or hereafter to be made, pursuant to the choice of creditors, should be found necessary to be vacated, and a new assignment made of the debts and effects unreceived, and not disposed of by the then assignees, to other persons, to be chosen by the creditors as aforesaid, it is lawful for the lord chancellor, lord keeper, or commissioners of the great-seal, upon petition of any creditor, to make such order therein as he or they shall think just and reasonable; and in case a new assignment shall be ordered to be made, then such debts, effects, and estate of the bankrupt, shall thereby be effectually and legally vested in such new assignee or assignees, and it shall be lawful for him or them to sue for the same in their names, and to discharge any action or suit, or give any acquittance for such debts, as effectually to all intents and purposes as the assignees in the former assignment might have done; and the commissioners shall cause public notice to be given in the two London Gazettes that shall immediately follow the removal of such assignees, and the appointment of such others as aforesaid, that such assignees are removed, and such others appointed in their stead, and that such persons as are indebted to the bankrupt's estate, do not pay any debts to the assignees removed; and if an issue is directed to be tried in the time of the old assignees, the court on petition will order the same issue to be tried by the new ones.

If there is any injustice committed by assignees, and that they, with the bankrupt's consent, will admit of sham debts being proved, the court will remove such assignees, and order the consideration of such debts to be inquired into, and all parties to be examined upon interrogatories, and appoint new assignees, and to direct the commissioners to see what is really due from the bankrupt's estate to his creditors; and after the assignees are chosen, will order costs of the parties so unjustly acting, to be taxed by a master and paid by them.

If assignees live at a great distance from the bankrupt's estate or effects, whereby such estate or effects may be incumbered with heavy charges, or occasion a neglect for getting in such effects; upon the application of the majority

majority of the creditors who have proved their debts under the commission, and proving the same by affidavit, the court will discharge such *assignees*, and direct a new assignment to be made to such other *assignees* as the creditors shall appoint, and direct, that the old *assignees* shall join in such new assignment.

If it appears that there are accounts between the bankrupt and the *assignees*, and that the *assignees*, although there may be notes or bonds subsisting, so as to intitle them to prove their debts, yet, if upon the balance of such accounts, the *assignees* appear to be debtor to the bankrupt's estate, the court will for such reason remove them.

If there appears partiality or unfairness in the choice of *assignees*, the court on petition will remove them.

If it appears that *assignees* have prevented creditors from proving their debts, to make number and value for the bankrupt's certificate, and for that purpose have contested such debts, and have refused to admit them; the court will for such unfairness remove the *assignees*, and admit such creditors to prove such debts as shall appear to be justly due to them. See BANKRUPT.

ASSISA panis et cervisie, the power or privilege of *assising* or adjusting the weights and measures of bread and beer; as the weight of bread prescribed by the lord mayor of London, and other magistrates, is still called the *size* or *assise* of bread: *z*o half a crust or farthing-bread is in Cambridge called a *size* of bread; and a servitor is there a *sizor*, or one who is to live upon such an assized allowance: hence to *assize*, *i. e.* to match cloths, silks, &c. or to get some of the same *assize* or proportion: hence also *size* for height and stature.

ASSISE, according to our ancient books, is defined to be an assembly of knights, and other substantial men, with the bailiff or justice in a certain place, and at a certain time appointed. *Custom. Normand. cap. 24.* This word is properly derived from the Latin verb *assideo*, to sit together, and is also taken for the court, place, or time, when or where the writs and processes of *assise* are handled or taken. And in this signification *assise* is general; as when the justices go their several circuits with commission to take all *assises*; or special, where a special commission is granted to certain persons, (formerly oftentimes done) for taking an *assise* upon one or two disseisins only. *Bract. lib. 5. Corwell.*

Concerning the general *assise*, all the counties of England are divided into six circuits, and two judges are assigned by the king's commission to every circuit, who hold their *assises* twice a year in every county, (except Middlesex, where the king's courts of record do sit, and where his courts for his counties palatine are held) and have five several commissions: 1. *Of oyer and terminer*, directed to them and many other gentlemen of the county, by which they are empowered to try treasons, felonies, &c. and this is the largest commission they have. 2. *Of gaol-delivery*, directed to the judges and the clerk of *assise* associate, which gives them power to try every prisoner in the gaol committed for any offence whatsoever, but none but prisoners in the gaol; so that one way or other they rid the gaol of all the prisoners in it. 3. *Of assise*, directed to themselves only and the clerk of *assise*, to take *assises*, and do right upon writs of *assise* brought before them by such as are wrongfully thrust out of their lands and possessions: which writs were heretofore frequent, but now men's possessions are sooner recovered by ejectments, &c. 4. *Of nisi prius*, directed to the judges and clerk of *assise*, by which civil causes grown to issue in the courts above, are tried in the vacation by a jury of twelve men of the county where the cause of action arises; and on return of the verdict of the jury to the court above, the judges there give judgment. 5. *A commission of the peace*, in every county of the circuits; and all justices of the peace of the county are bound to be present at the *assises*; and sheriffs are also to give their attendance on the judges, or they shall be fined. *Bacon's Elem. 15, 16, &c.*

There is a commission of the peace, *oyer and terminer* and gaol-delivery of Newgate, held several times in a year, for the city of London and county of Middlesex, at Justice-hall in the Old Bailey, where the lord mayor is the chief judge. In Wales there are but two circuits, North and South Wales; for each of which the king

appoints two persons learned in the laws to be judges. *Stat. 18 Eliz. cap. 8.* If justices sit by force of a commission, and do not adjourn the commission, it is determined. 4 *Infl.* 265.

The constitution of the justices of *assise* was begun by Henry II. though somewhat different from what they now are; and by *magna charta*, justices shall be sent through every county once a year, who, with the knights of the respective shires, shall take *assises* of novel *disseisin*, &c. in their proper shires, and what cannot be determined there, shall be ended by them in some other place in their circuit; and if it be too difficult for them, it shall be referred to the justices of the bench, there to be ended. 9 *Hen. 3. cap. 12.* Justices of *assise*, &c. are to hold their sessions in the chief towns of the county; and their records to be sent into the Exchequer. 6 *R. 2. 9 Ed. 3.* By *stat. 21 Geo. II. c. 12.* The summer *assises* in Buckinghamshire shall be held at the town of Buckingham. *Assise* is likewise used for a jury, by whom *assises* of novel *disseisin* are tried. *Lit. c. Rents.* The panels of *assises* shall be arrayed, and a copy indented delivered by the sheriff, &c. if demanded, on pain of forty pounds by *stat. 6 Hen. VI. cap. 2.* And *assise* is taken for a writ for recovery of possession of things immoveable, whereof any one and his ancestors have been disseised.

ASSUMPSIT is taken for a voluntary promise, by which a man assumes or takes upon him to perform or pay any thing to another: it comprehends any verbal promise, made upon consideration; and the civilians express it diversly, according to the nature of the promise, calling it sometimes *pactum*, sometimes *promissio*, or *constitutum*. *Corwell.* See ACTION.

ASSURANCE. See INSURANCE.

ASTRABATH is situated on a gulph of the Caspian-Sea, being the capital of the province of that name, and passes for one of the finest cities in Persia, as it is large, well built, rich, and very populous. Here are many fine fabricks of silk, and woollen stuffs, more particularly a sort of camblet that is vastly esteemed. The circumjacent lands are equally agreeable and fertile in every necessary of life, and the neighbouring mountains are all covered with forests of fruit-trees. The gulf of *Astrabath* is about fifteen leagues from east to west, and four or five from north to south; but is only navigable for small vessels, because here are not more than ten or twelve feet water at its entrance to the Caspian-Sea; but it is of great convenience to this city, by means of the communication it has with all the Persian ones seated on that sea.

ASTRACAN, a city under the dominion of the Russian empire, is seated at the mouth of the Volga in the Caspian sea; the principal merchants trading here are Muscovites, Tartars, Armenians, and Indians. All sorts of merchandizes may be sold in the morning at the bazar or market of the Tartars, where other nations have the liberty of carrying theirs. After noon the Russian bazar is held, where the Armenians are equally admitted, and the Indians transact all their business in their own caravansera.

The customs for the imports and exports of this city, though reckoned very low and moderate, were computed to bring in to the late czar, Peter the Great, 250,000 crowns *per annum*, besides the convenience of vending all the native commodities of Russia, and receiving in exchange the silks, cotton, and over valuable merchandizes of Persia, India, &c. Here is a fish called *biloege*, which is caught in the Volga, near its mouth, in great abundance, of the roes of which they make what we call *caviar*, in which the Russians drive a very advantageous traffic.

ASTRAGAL, in architecture, signifies a little round member, in the form of a ring or bracelet, serving as an ornament to the tops and bottoms of columns. The *astragal* is used to separate the *fascia* of the architrave; in which case it is wrought in chaplets of beads and berries. It is used both above and below the lights adjoining immediately to the dye or square of the pedestal.

ASTRAGAL, in gunnery, is the cornice ring of a piece of ordnance.

ASTRINGENT, in physick, such medicines as are of an astringent or binding quality. The simples, com-

monly called *aftringents*, principally abound with rough, earthy, or saline particles, and are of a heavy compact texture, which, at first view, forbids them to be meddled with in distillation. In tinctures also with a spirituous menstruum, they are very unfuitable; because their superior gravities and bulks will not suffer them to unite with, and be suspended in such, liquors.

In decoction, indeed, many *aftringents* may be retained with efficacy, especially those of a saline and styptic nature, as allum, galls, and oak-bark; but few others can be thus ordered to advantage, because they are too heavy for suspension in an aqueous fluid. *Quincy's Lett.*

Aftringents are very proper to restore a tone and elasticity to the animal fibres, when debilitated by diseases, intemperance, or accident. But these are very seldom proper without a previous attenuation of the juices, and a course of deobstruent medicines; because obstructions are more firmly riveted, and the viscid juices circulated with more difficulty, when the diameters of the vessels are contracted by *aftringents*. *Hoffman.*

ASTRINGENTS in dyeing, are most commonly the bark of alder, pome-granate, crab, and walnut-tree, when the sap rises; and also the saw-dust of oak, walnut-shells and roots, gall-nuts, allum, and fumach. *See DYEING.*

ASTROITES, in natural history, a kind of figured stone, having on its surface the representation of a star.

The matter and substance of these stones, if broken, resembles a flint, of a dark, shining politure; but much softer, and easily corroded by an acid menstruum.

These stones, as we now find them, are all fragments, either one single joint, or two, three, or more joints set together, making a pentagonous or five-sided column. Every joint consists of five angles, which are either drawn out and sharp, and consequently the sides of pieces, made up of such joints, are deep-channelled; or the angles are blunt, and round, and the sides plain and very little hollowed.

These stones generally move in vinegar, juice of lemons, &c. sending forth bubbles like chalk, and most of our mineral stones. This motion seems to proceed from the acid mixing with the mineral salt, so that the spirits, by fermentation, breaking forth under the stone, produce that effect. *Philos. Transf. Abr. vol. ii.*

Naturalists are not agreed to what species the *astroites* should be referred. Some will have them native stones, others rock-plants, and others petrifications of plants.

ASTROLABE, a stereographic projection of the sphere, either on the plane of the equinoctial, the eye being supposed to be placed in the pole of the world, or on the plane of the meridian, when the eye is supposed in the point of intersection of the equinoctial and horizon.

Sea. ASTROLABE, is an instrument for taking the altitude of the sun or stars at sea; for this purpose you need only turn to the sun, so that the rays may pass freely through both the sights, and the fiducial edge of the index will cut the altitude in the limb.

The *astrolabe* is now rarely used, and this is no wonder, because the motion of the ship renders it impossible to keep it in a perpendicular direction, and consequently the altitude obtained from it cannot be depended upon. Indeed the motion of the ship renders an observation very precarious, when taken with most other instruments. But this defect is now happily supplied by that useful instrument contrived by the learned J. Hadley, Esq; called Hadley's quadrant. *See* QUADRANT.

ASTURIAS, a principality in Spain, lies on the north side, along the bay of Biscay, borders on the west on Galicia; on the south it is divided by Castile and Leon, by a ridge of mountains. On the coast it reaches to the port Llanes, now Santillana, where it joins a narrow slip of land belonging to Old Castile; which runs into the sea between Asturias and Biscay.

The places of most note in this principality are, Oviedo, Santillana, Gijon, and the little province of Liebana.

Oviedo is about twenty miles distant from the bay of Biscay; the country about it is very mountainous, but abounds in cattle, Indian wheat, chestnuts, corn, and all sorts of grain. The mountains, especially those which

divide this principality from Leon and Castile, besides their natural fertility, were formerly rich in mines of all sorts of metals and minerals.

Liebana is about twenty-seven miles long, and twelve broad. It is one of the most craggy and mountainous parts of Spain, excessive high, and almost inaccessible. These mountains are called *Europæ*, and in full front of the sea, and produce plenty of corn, wine, fruit, cattle, and game.

ATCHE, the smallest coin that is struck, and current in the grand seignior's dominions. It is of silver, (no copper coin being current in the whole Ottoman empire, except in the province of Babylon) and is worth two thirds of an English farthing. It is pretty much like those spangles of tinsel used formerly for setting off gold and silver embroidery, except that it is somewhat stronger and longer; and it is marked as the *para* with Arabian characters. Three or four *atches* are commonly given for one *para*.

ATHANOR, in chemistry, a kind of digesting furnace, contrived to keep a constant heat for a considerable time.

ATIBAR, a name given by the inhabitants of the kingdom of Gago in Africa to gold-dust; and from that word the Europeans, and especially the French, have composed the word *tibir*, which also signifies gold-dust among those who trade in that commodity.

ATLAS, a satin, manufactured in the East-Indies, of several sorts and colours, some being plain, some striped, some flowered, and the flowers either gold or only silk. Most of the colours are false, especially the red and crimson.

The manufacture of *atlasses*, especially the flowered, is wonderful and singular, the gold and silk being worked together in such manner as no European workmen can imitate; yet they are very far from having that fine gloss and lustre which the French know how to give their silk stuffs.

In the Chinese manufactures of this sort, they fold paper on one side with leaf-gold, then cut it into long slips, and weave it into their silks, which makes them, with very little cost, look exceeding rich and fine. The same long slips are twisted or turned about silk threads, so artificially, as to look finer than gold thread, though it be of no great value. This, however, may afford a good hint to our British weavers, for the like kind of improvements.

Among the several sorts of *atlasses*, the most considerable are the *cotonis*, the *caucanias*, the *cotonis-bouilles*, and the *bouilles-chafmay*, or *charmay*. The *atlasses cotonis* are thus called, because the ground of them is cotton, and the rest silk. The *caucanias* are striped sattins, and those of them which seem most silky are stiled *quenkas*. The *calquiers* are sattins made after the Turkish manner, or like Hungary point. The *bouilles-cotonis* and *bouilles-charmay* are thick silks, like those strong taffeties made at Tours in France. There are *atlasses* from four French ells and one eighth in length, by two thirds in breadth, to fourteen ells in length, by nine tenths in breadth. Those that come near to half the usual length are called half-pieces.

ATLASSES, in architecture, are those figures, or half-figures of men, commonly used instead of columns or pilasters, to support any member, as a balcony, or the like. They are otherwise called *telamones*.

ATTACH, signifies to take or apprehend by commandment of a writ or precept. There is this difference between an arrest and an attachment, that an arrest proceedeth out of lower courts by precept, and an attachment out of higher courts by precept or writ; and that a precept to arrest hath formal words, *duci facias*, &c. and a writ of attachment these words, *precipimus tibi quod attachies talem, et habeas eum coram nobis*, &c. whereby it appeareth, that he who arresteth, carrieth the party arrested to another higher person to be disposed of forthwith, and he that attacheth, keepeth the party attached, and presenteth him in court at the day assigned in the attachment. *Cowell.*

ATTACHMENT, is a process that issues at the discretion of the judges of a court of record, against a person for some contempt, for which he is to be committed,

mitted, and may be awarded by them upon a bare suggestion, or on their own knowledge, without any appeal, indictment, or information; for though by the statute of *Magna Charta*, none are to be imprisoned *sine judicio parium vel per legem terræ*; yet this summary method of proceeding, being absolutely necessary to the furtherance and execution of justice, seems to have been long practised, and is certainly now established as part of the law of the land. *Lamb. Eiren. lib. 1. cap. 16. 1 New Abr. 180. See Westl. 2. cap. 3.*

Attachments are usually granted on a rule to shew cause, unless the offence complained of be of a flagrant nature, and positively sworn to; in which case the party is ordered to attend, which he must do in person, as must every one against whom an *attachment* is granted; and if he shall appear to be apparently guilty, the court in discretion, in consideration of the nature of the crime, and other circumstances, will either commit him immediately, in order to answer interrogatories to be exhibited against him, concerning the contempt complained of, or will suffer him to enter into recognizance to answer such interrogatories; which if they be not exhibited within four days, the party may move to have the recognizance discharged; otherwise he must answer them, though exhibited after the four days; but in all cases, if he fully answer them, he shall be discharged as to the *attachment*, and the prosecutor shall be left to proceed against him for the perjury, if he thinks fit; but if he deny part of the contempts only, and confess other part, he shall not be discharged as to those denied, but the truth of them shall be examined, and such punishment inflicted as from the whole shall appear reasonable; and if his answer be evasive as to any material part, he shall be punished in the same manner as if he had confessed it. *2 Hawk. P. C. 141. 1 Salk. 84. 6 Mod. 73. 2 Jones 178.*

Attachment foreign, is an *attachment* of the goods of foreigners, found in some liberty, to satisfy their creditors within such liberty. *Carth. Rep. 66.* And by the custom of some places, as London, &c. a man may *attach* money or goods, in the hands of a stranger. But a foreign *attachment* cannot be had when a suit is depending in any of the courts of Westminster, which makes the matter not to be meddled with by any other court. *Cro. Eliz. 691.* And nothing is *attachable* but for a certain and due debt; though by the custom of London money may be attached before due, as a debt; but not levied before due. *Sid. 327. 1 Nels Abr. 282, 283.*

Foreign *attachments* in London, upon plaint of debt, are made after this manner: "A oweth B 100l. and C is indebted to A 100l. B enters an action against A of 200l. and by virtue of that action a serjeant *attacheth* 100l. in the hands of C, as the money of A to the use of B, which is returned upon that action." The *attachment* being made returned by the serjeant, the plaintiff is immediately to fee an attorney before the next court holden for the comptur; or the defendant may then put in bail to the *attachment*, and nonsuit the plaintiff: four court-days must pass before the plaintiff can cause C, the *garnishee*, in whose hands the money was *attached*, to shew cause why B should not condemn the 100l. *attached* in the hands of C, as the money of A, the defendant, in the action (though not in the *attachment*) to the use of B, the plaintiff: and the *garnishee* C may appear in court by his attorney, wage his law, and plead that he hath no money in his hands of the defendant's or other special matter; but the plaintiff may hinder his waging of law, by producing two sufficient citizens to swear that the *garnishee* had either money or goods in his hands of A at the time of the *attachment*, of which affidavit is to be made before the lord mayor, and being filed, may be pleaded by way of estoppel: then the plaintiff must put in bail, that if the defendant come within a year and a day into court, and he can discharge himself of the money condemned in court, and that he owed nothing to the plaintiff at the time in the plaint mentioned, the said money shall be forth coming, &c. if the *garnishee* fail to appear by his attorney, being warned by the officer to come into court to shew cause as aforesaid, he is taken by default for want of appearing, and judgment given against him for the goods and money *attached* in his hands, and he is without remedy

either at common law or in equity; for if taken in execution, he must pay the money condemned, though he hath not one penny, or go to prison; but the *garnishee* appearing to shew cause why the money or goods *attached* in his hands, ought not to be condemned to the use of the plaintiff, having feed an attorney, may plead as aforesaid, that he hath no money nor goods in his hands of the party's against whom the *attachment* is made, and it will then be tried by a jury, and judgment awarded, &c. but after trial, bail may be put in, whereby the *attachment* shall be dissolved, but the *garnishee*, &c. and his security will then be liable to what debt the plaintiff shall make out to be due, upon the action; and an *attachment* is never thoroughly perfected, till there is a bail and satisfaction upon record. *Privileg. Lond.*

A citizen of London was indebted to a foreigner upon bond, and the foreigner was indebted to the citizen upon a simple contract; the foreigner died, and upon oath made by the citizen, that his debt was a just debt, he levied a plaint in London against the executor of the foreigner; and upon four defaults recorded, he had judgment, and then he attached the debt in his own hands, finding sureties, that if the debt was not disproved by the executor within a year and a day, or the judgment reversed, that then he should be discharged of so much of the debt which he owed on the bond; the question was, whether this custom did extend to foreigners, as well as to citizens; it was not resolved. *Dyer 109.*

Debt upon bond for one hundred marks, conditioned to pay fifty pounds on such a day, &c. the defendant pleaded a *tender* upon the day, upon which they were at issue, but afterwards he pleaded, that after the last continuance the one hundred marks were attached in his hands in London, at the suit of another, &c. And upon demurrer to this plea, the court at first doubted, whether an *attachment* was good pending an action in the court at Westminster; but afterwards they held, that the one hundred marks were attachable after the last continuance. *Cro. Eliz. 101, 691.*

In an action on the case, the plaintiff had judgment against the defendant, and he owing sixty pounds to one G. D. he entered a plaint against him in London, and attached the sixty pounds in the hands of the said defendant, against whom the plaintiff had recovered as aforesaid, and had execution according to the custom; afterwards the plaintiff brought a *sci. fa.* against the defendant, to shew cause why he should not have execution upon the judgment which he had recovered, to which the defendant pleaded the *execution upon attachment*; and upon demurrer to that plea, it was adjudged against the defendant, because a duty which accrue by matter of record cannot be attached by the custom of London; for judgments obtained in the king's courts shall not be defeated or avoided by such particular customs, they being of so high a nature, that they cannot be reached by *attachment*. *1 Leon. 29.*

Debtor and creditor being both citizens of London, the debtor delivered several goods to the Exeter carrier, then in London, to carry and deliver them at Exeter, and the creditor attached them in the hands of the carrier for the debt due to him from his debtor; adjudged, that the action should be discharged, because the carrier is privileged in his person and goods, and not only in the goods which are his own, but in those of other men, of which he is in possession, for he is answerable for them. *1 Leon. 189.*

Upon a plaint affirmed in the court of the city of Exeter against the defendant; the money due to the plaintiff was attached in the hands of G. D. upon a suggestion, that he owed money to the defendant; thereupon the said G. D. appeared to the *attachment*, and pleaded *nil debet* to the defendant; and upon demurrer to this plea, there was judgment against him, because he ought to have pleaded not only *nil debet*, but also that he had no goods of the defendant's in his hands, whereupon G. D. brought a writ of error, &c. and the judgment in Exeter was reversed; for it was adjudged, that *nil debet* alone was a good plea. *1 Leon. 321.*

The debtor owed the creditor one hundred pounds, and G. D. owed the debtor twelve pounds, the debtor died intestate, and the *ordinary* granted administration to W;

W; afterwards the creditor affirmed a plaint in London against the ordinary for the hundred pounds, and upon his suggestion that by the default of the ordinary (being returned *nihil habet*) the twelve pounds was attached in the hands of G. D. and after the fourth default of the ordinary, it being returned *non est inventus*, the plaintiff recovered against G. D.; afterwards the administrator brought an action of debt against him for twelve pounds, to which he pleaded in bar this custom of foreign attachment; and upon a demurrer to this plea the administrator had judgment, because no action did lie against the ordinary after administration granted, neither could the administrator have any action against G. D. the debtor of the intestate. *Dyer* 247.

A sum of money was to be paid at Michaelmas, and it was attached before that day; adjudged, that a foreign attachment cannot reach a debt before it is due; therefore, though the judgment on the attachment was after Michaelmas, yet the money being attached before it was due, it is for that reason void. *Cro. Eliz.* 184.

In trespass for making a dyer's furnace, it was found, that upon a plaint levied, the sheriff attached it, being fastened to a wall of the house, and delivered it to the defendant, against whom the action was now brought; adjudged, that it being fixed to the wall, it could not be attached. *Cro. Eliz.* 370.

An executor submitted to an award, and the arbitrators awarded, that the defendant should pay the executor three hundred and fifty pounds. This money is not attachable in his hands by any creditor of his testator, though it is assets in his hands when he recovered, because it was not due to the testator *tempore mortis*, and the custom of foreign attachments extends only to such debts. *1 Vent.* 111.

The plaintiff set forth the custom to be, that the debt ought to be affirmed upon the oath of the party in *curia Guildhall*, and then he alledged, that he made oath in *curia vicecomitis in computatorio*, &c. the cause was ended by agreement. *Dyer* 199.

Case by administrator, in which the cause was, that Tenant was indebted to the intestate by bond, and the intestate was indebted to Heydon upon a contract, and that he (the administrator) intending to put the bond in suit against Tenant, he promised, that if the administrator would forbear, &c. he, the defendant, would pay, &c. afterwards Heydon brought an action of debt upon the contract against the administrator in London, and the money which Tenant owed to the intestate was attached in Tenant's hands; and now the administrator brought an action on the promise against Tenant, who pleaded all this matter; and upon a demurrer, it was insisted for the plaintiff, that this debt was not attachable by a foreign attachment, because the promise being to pay at a day to come, rests altogether in damages, and nothing is attachable but a certain and due debt: *sed per curiam*, this debt is attachable, for it is a due and certain debt before the promise made, because the promise was to pay the debt due to the intestate by bond; but it might have been otherwise if the debt had arisen upon a promise. *1 Roll. Rep.* 105.

If a man sue another in the mayor's court, &c. and a third person is indebted to the defendant as much as he owes the plaintiff, and the money is attached in the hands of this third person, and condemned, and afterwards judgment is given against him, yet at any time before execution the plaintiff may resort to the defendant again, who is his principal debtor, and get judgment and execution against him. *Dyer* 182.

A foreign attachment was pleaded to an action of debt; the plaintiff in that action replied, that he was not indebted to the defendant in any sum by which he might be attached to appear; and this was held a good replication, because it was issuable whether he was indebted or not, for if he was not indebted, then he could not be attached. *Cro. Eliz.* 598.

Debt was brought in C. B. upon a bill penal of 13l. 13s. 4d. they pleaded in bar a foreign attachment in London, made by one Moulton of 13l. in his hands; and upon demurrer to this plea, it was adjudged ill, because it did not appear, that the 13l. attached was part of the debt of 13l. 13s. 4d. due to the plaintiff in the origi-

nal action; but the chief reason was, because it appeared in the plea, that the attachment was made after the return of the original in the C. B. and so pending that action in that court, which ought not to be. *Cro. Eliz.* 691.

Action of debt, &c. The defendant pleaded in bar, that there was a custom in London to attach the debt before the day of payment came; *et per curiam*, such a custom may be good, but to have judgment to recover the debt before the day of payment is come, cannot be a good custom, because the debtee himself could not recover in such case, and therefore he who made the attachment shall not. This custom was pleaded, that the debtee in person, or by his attorney, may swear that the debt is due; but this cannot be good as to the attorney: it was agreed, that goods might be attached by a foreign attachment, and that the value thereof ought to be found before judgment; but that this plea was ill, because the defendant did not aver it, *viz. et hoc paratus est verificare*. *W. Jones*, 406.

In action of debt on bond, the defendant pleaded in bar the custom of London, wherein the case was thus, *viz.* John North, the now defendant, owed Winkell 55l. and Winkell owed John North 55l. who being dead, and his widow being administratrix, commenced this action against Winkell, and set forth, that he levied a plaint in the counter against the administratrix, for this 55l. (but did not set forth, that it was due to him at the time of the plaint levied,) that she was summoned by a serjeant at mace to appear at the next court, who returned that she *nihil habuit* within the city, by which she might be attached, and she not appearing, Winkell affirmed *ore tenus*, that he owed John North 53l. (but did not set forth, that it was within the jurisdiction of that court) and prayed, that she might be attached by that money, in his own hands, to appear, which was done accordingly, and she not appearing in four courts afterwards, Winkell, at the fifth court, prayed execution of the said debt of 53l. so attached in his hands, and made oath, that John North owed him that money, and that his administratrix detained it from him, and thereupon he had judgment to recover the said 53l. in part of the 55l. due to him, and found pledges to restore, if the debt should be disproved by the administratrix within a year next ensuing, and averred, that the debt for which he was now sued was parcel of the said 53l. which could not be, because the 55l. was due to himself, and that the bond upon which the administratrix had declared against him, was given to her to secure part of the debt of the 53l. due from him to the said John North, which is contradictory to what he had averred before; besides, upon a demurrer to this plea, it was held, that the debt must be due to Winkell before he made the attachment; and he having set forth, that it was not due before that time, he cannot levy a plaint for a debt before it is due, and by consequence cannot have a foreign attachment to compel an appearance to such a plaint. *2 Lutw.* 977.

Ruled, that money owing on a judgment obtained in the king's court, cannot be attached. *1 Mod.* 103.

The plaintiff brought an action of debt in London against the Hambrough company, who not appearing upon a summons, and a *nihil* returned, an attachment was granted to attach the debts owing to the company in the hands of several persons; and this being removed by *certiorari* into B. R. it was objected, that the debts owing to a corporation are not attachable; but a *procedendo* was granted, for they are proper judges below, whether this is within the custom of London; if there is no such custom, and they rule that there is, the party grieved may have his remedy at law; so let them proceed according to their custom, at their peril. *1 Mod.* 212.

Debt upon bond, conditioned to pay 50l. before such a day; the defendant pleaded the custom of London of foreign attachment, *viz.* that where a man is indebted to another, and that man hath money due to him from one in London, that the creditor may attach it before it is due to him, and that such a creditor of the now plaintiff did attach 50l. in the defendant's hands before it was due to the plaintiff, and gave security, according to the custom, to repay the debt, if it should be disproved within a year and a day; and that on such a day (which was after the date of the bond) he paid the 50l. to the creditor up-

on a *sci. fa.* brought against him (the defendant) according to the custom; and upon a demurrer to this plea in bar, it was insisted, that a custom to attach money before it was due, could not be good; but adjudged, that it was, for though it might be attached as a debt, it could not be levied before it was due; and so the custom was laid. *Sid.* 327.

The case referred by the *Ch. Just. Holt*, at a trial before him, for the opinion of the judges, was thus: *Js.* Masters owed money to Gosfreight, and died, and the defendant Lewis, afterwards received 250*l.* due to Masters the intestate; Gosfreight contended the administration, and before it was granted, he levied a plaint in the sheriff's court against the archbishop of Canterbury, for the debt due to him from Masters the intestate; because, till administration granted, the ordinary did represent his person: upon this plaint, there was a *nihil* returned, and upon four summons, there was a *scire facias* and judgment against the archbishop; and this money was attached in the hands of the defendant, Lewis, as a debt due from the archbishop to the intestate; and it was afterwards condemned and paid to Gosfreight; then administration was granted to the plaintiff Masters, who brought an *indebitatus assumpsit* against Lewis; and upon *non assumpsit*, pleaded, the question referred was, whether this payment to Gosfreight was a good discharge to Lewis, by virtue of the custom of London of foreign attachment; and adjudged that it was not, because the plaint was levied against the archbishop, who was neither debtor nor debtee, therefore could neither sue nor be sued. The reason why money is attachable in the hands of the garnishee, is to make the real debtor appear, upon whose appearance, the garnishee is discharged, and then the debtor must put in bail to render his body, or pay the condemnation money; but the archbishop cannot be compelled to do either; and therefore he is not within the custom, nor the defendant Lewis either, because he was never indebted to the archbishop, and therefore could not be compelled to appear, by levying a plaint against the archbishop, to whom nothing was due; the plaintiff had judgment. *5 Mod.* 75, 92.

The case was: Wallis owed Snell 500*l.* and Parker owed Wallis 220*l.* which he assigned to Snell in part of his debt: Wallis being also indebted to Lewis in 250*l.* he levied a plaint against Wallis in the sheriff's court of London, suggesting, that Parker owed him 220*l.* which Lewis attached in the hands of Parker; and Snell became bail for Wallis at the suit of Lewis, and afterwards brought an *habeas corpus*, and removed the plaint into B. R. and was also bail for Wallis there, and Lewis declared against him there: afterwards Wallis came before a judge of B. R. and declared, that he never consented that Snell should be bail for him, either upon the attachment or upon the *habeas corpus*, and all was done without his knowledge; whereupon he prayed a *procedendo* to the action in London, which the judge granted, it being confidently affirmed to him, that no bail could be put in upon a foreign attachment, unless the lord-mayor was present, nor then, if the defendant did not consent; and upon this *procedendo* Wallis confessed the action below at the suit of Lewis, and he had judgment; and Snell, who was his bail, was taken in execution, and paid the money to Lewis. *Et per curiam*, after Wallis had assigned to Snell the debt due to him from Parker, it then became the right and property of Snell, and Wallis was then no more than a trustee for Snell; if so, then Snell being bail to the foreign attachment, it was *quasi* for Wallis, and by his assent, and that being done, both the foreign attachment, and all proceedings in it, are at an end; for the design of a foreign attachment is only to compel the defendant in the original action to appear; and after bail was put in upon the *habeas corpus*, and Lewis had declared in B. R. then the court was possessed of the cause, and it shall never be restored afterwards to the inferior court by any suggestion of the defendant, as it was done in this case by Wallis; therefore a *superfedeas* was awarded to the *procedendo*, *quia improvide*, &c. by which the judgment, and all the proceedings in the sheriff's court, were *coram non iudice*, and restitution was ordered to be made to Snell, and Lewis was left to proceed upon the action removed by the *habeas corpus*. *T. Jones*, 222.

Where a foreign attachment is pleaded to an action, the custom is to set forth, that he who levied the plaint shall have execution of the debt owing by himself, and by which he was attached, if the plaintiff in the original action shall not disprove it within a year and a day; now if the plaintiff in the action below doth not set forth such conditional judgment given by the court, it is wrong, because he doth bring his case within the custom. *2 Lutw.* 985.

In *assumpsit*, &c. there was evidence given, that the debt was attached by the custom of London before the action brought, and that it was condemned there before the plea pleaded; and this evidence was given upon the general issue *non assumpsit*, and it being insisted for the defendant, that this should relate so as to defeat the plaintiff's action; it was adjudged, that where there is an attachment and condemnation before the action brought, it may be given in evidence upon the general issue, because there is an alteration of the property; but if the attachment be only for the action brought, and the condemnation afterwards, the attachment may be pleaded in abatement, and the condemnation may be pleaded in bar, but shall not be given in evidence on the general issue, because by the condemnation the property is altered, but not before. *1. Salk.* 280.

In *assumpsit*, the defendant, in discharge of the note upon which the action was brought, produced the record of a foreign attachment, wherein the said debt was attached and condemned, and *Trevor, Ch. Just. of C. B.* held this a good discharge; but if the plaintiff could have shewed an original precedent to the attachment, so that it might appear, that the court was possessed of the action before the attachment, the plaintiff might have recovered, notwithstanding the debt was attached and condemned; but in this case, the declaration was between the time of the attachment and the condemnation, *1 Salk.* 291.

W. R. broke, and went beyond sea; but before he went, he assigned his goods to three persons, for the equal benefit of his creditors, two of these assignees being his creditors, set up a trustee for them to attach the goods in London: now, upon an attachment, there always goes a *scire facias* by way of *garnishment*, to which these two assignees, who were creditors, would not appear, but the third assignee, who was no creditor, offered to appear and plead; but the judge of the court refused his plea, unless he would appear for the other two, and thereupon moved for a prohibition, and the court inclined against the custom to compel one garnishee to appear for the rest; but the common serjeant said, that if he put in bail, and wage his law alone, that would dissolve the attachment. *Mod. Ca. Smith.* See MAYOR of London.

ATTENUANTS, or *attenuating medicines*, are such as subtilize and divide the humours into smaller particles, so that they may be more easily circulated through the vessels.

Attenuating and *inciding medicines*, are of very extensive use in the practice of physic, and come under different denominations, according to the different effects they produce. Thus, when tenacious and viscid juices not only stagnate in the cavities of the vessels, but obstruct the minute ducts of the viscera and emunctories, these medicines, by their inciding and attenuating quality, discharge the humours, and remove the obstructions; for which reason they may not improperly be called aperients. They also deserve the name of antiscorbutics, and sweeteners of the blood; for since the purity and proper temperament of the vital juices depend upon the due secretion and excretion of every thing superfluous and recrementitious in the constitution, and since the necessary degrees of secretion and excretion are intercepted by the minute ducts of the glands and emunctories being blocked up by thick and viscid juices, it is therefore obvious, that such medicines as attenuate the viscid humours, and remove obstructions, must be sweeteners of the blood, and excellent remedies against the scurvy, in which the humours have evidently lost their due temperament, are become impregnated with heterogeneous, viscid, saline, sulphureous, and acrid principles. *Hoffman*.

ATTIC, in architecture, implies a kind of building, wherein there is no roof or covering to be seen, the buildings

buildings of Athens being generally of this form ; whence the name.

ATTIC order, according to M. le Clerc, is a kind of rich pedestal. Some architects give it the several capitals of all the orders of columns ; but he says, the Ionic, Roman, and Corinthian, do not at all become it. The best way, in his opinion, is only to distinguish the capitals by a difference in their mouldings ; which may be made more or less simple, and more or less delicate, according to the relation they are to bear to the architecture underneath.

The name *Attic* is also given to a whole story, in which this order enters ; this little order being always found over another that is greater.

This pedestal, or false pilaster, he says, ought always to have the same breadth with the column or pilaster underneath ; and its height may be equal to a third, or even a half of the same column or pilaster by which it is supported.

ATTIC continued, is that which encompasses the whole contour of a building, without any interruption, following all the jets, the returns of the pavilions, &c.

ATTIC interposed, is one situate between two small stones, sometimes adorned with columns or pilasters.

ATTIC base, is a peculiar kind of base in the Ionic order, by the ancient architects ; and also by Palladio, and other moderns, in the Doric. It is the most beautiful of all bases.

ATTORNEY, is a person appointed by another to do any thing in his stead, and is as much as *procurator* or *syndicus*, in the civil law. *Cowell. West*, in his *Symb. part. 1. lib. 2, sect. 559*. defines *attornies* thus : *Attornies* are such persons as by the consent, commandment, or request of another, do take heed, see to, and take upon them, the charge of other men's business in their absence. —But the person here first treated of, is an *attorney* at law, who is appointed to prosecute and defend for his client, and is considered as an officer belonging to the courts of justice ; concerning whom are several statutes and adjudications.

In respect of the several courts, there are *attornies* at large, and *attornies* special, belonging to this or that court. An *attorney* may be solicitor in other courts, by a special retainer. One may be *attorney* on record, and another do the business ; and there are *attornies*, who manage business out of the courts, &c.

4 *Hen. IV.* it was enacted, that the justices should examine *attornies*, and remove the unskilful ; and *attornies* shall swear to execute their offices truly, &c. The statute 33 *Hen. VI.* and *VII.* was made to restrain the number of *attornies*. None shall be admitted *attornies* in courts of record, but such as have been brought up in the said courts, or are well practised and skilled, and of an honest disposition ; and no *attorney* shall suffer any other to follow a suit in his name, on pain of forfeiting 20 l. to be divided between the king and the party grieved. *Attornies* are to take the oaths of the government, under penalties, and disability to practise, 13 *Will. III. c. 6*. By an order of all the judges, *attornies* are to be admitted of some inn of court, or chancery (except house-keepers in London and Westminster, &c.) and none shall be sworn an *attorney* till he is thus admitted. No *attorney* shall put himself out of the society he is admitted of till he is admitted of some other society, and deliver a certificate thereof ; and all *attornies* are to be in commons, at the times ordered by the society to which they belong ; and offending therein, shall be put out of the roll of *attornies* : *Ordin. Mich. 3 Ann.* Attachments have been granted against those who have disobeyed this order, in not being admitted of some inn, &c. after service of the order. The act *Geo. II. c. 23*, ordains, that all *attornies* shall be sworn, admitted, and inrolled, before allowed to sue out writs in the courts at Westminster ; and, after the 1st of December, 1730, none shall be permitted to practise, but such as have served a clerkship of five years to an *attorney*, &c. duly sworn and admitted ; and *attornies* shall not have more than two clerks at one time, &c. He who is an *attorney* at one time, is *attorney* at all times pending the plea, 1 *Danv. 609* : and the plaintiff or defendant may not change his *attorney*, while the suit is depending, without leave of the court, which would

reflect on the credit of *attornies*, nor until his fees are paid, *Mich. 14. Car. II.* *Attornies* have the privilege to sue and be sued only in the courts of Westminster, where they practise ; and they shall not be chosen into offices against their will.

The youth, desirous of being an *attorney*, ought to have a clear, solid, and unclouded understanding, indefatigable patience and industry, and a prodigious memory, together with a genteel person, great fluency of speech, and both the behaviour and liberal education of a gentleman. He ought, in particular, to be acquainted with the Latin tongue ; though, as all law proceedings are now in English, that language is not so necessary as it was formerly. He should be able, upon occasion, to express his thoughts in writing, with great clearness and purity of language ; and to write with expedition a good bold round hand, and the secretary, or that commonly used in ingrossing. He should also know so much of the old court hands as to be able to read them ; and it is absolutely necessary, that he should be well versed in the rules of arithmetic. It is likewise proper, that he should understand the old French and the low Latin abbreviations ; for though the use of these is now laid aside, the young clerk will find them of service, in case he should have occasion to search court, or examine ancient deeds : but this knowledge he may easily acquire during his clerkship.

The young gentleman, who designs to engage in this profession, ought to be possessed of an incorruptible integrity, and to be above harbouring the thoughts of gaining money by little mean and low arts : he should be possessed of a fortune sufficient to prevent his lying under the temptation of having recourse to base methods of obtaining money, and have too much humanity and good-nature, to treat a person in distress with disrespect. In short, a parent or guardian ought to be very solicitous to find out a master for him of known integrity, and sufficient practice. This is the more necessary ; for the temptations to which the youth will be liable from the example of his fellow-clerks are, in London, so numerous, that if to these be added his master's want of honesty, scarce any thing less than a miracle can save him from ruin.

The sums *attornies* take with their clerks are very different : they serve only five years, and ought to be at least sixteen years old before they are bound ; but when their clerkship is expired, they are able to get, by acting as clerk to an *attorney*, little more than a common mechanic. When all these circumstances are considered, it must appear how absurdly those parents act, who having no fortune to give to a son, bring him up to be an *attorney's* clerk ; and thus force him to be contented with an income more precarious, and not much more considerable, than that of a journeyman-taylor, or to become a nuisance to society, by being a poor petti-fogging *attorney* : an employment equally base, scandalous, and injurious to society.

The good-natured *attorney*, who is a man of honour and conscience, not depending entirely on his profession for a support, will have numerous opportunities of saving an unhappy debtor from the miseries of a jail, by fairly and candidly representing his case to the creditor ; and, by acting as a mediator, he may frequently prevent troublesome and expensive law suits. An *attorney*, who thus behaves, acts up to the dignity of his character, and is a most worthy and amiable member of society. He finds that the integrity of his conduct is attended with the approbation of his own conscience ; and that where he seems most to act against his own interest, he most promotes it : he establishes a reputation among the honest and worthy part of mankind, that makes him diligently sought for by every good man who needs his assistance ; and as he encreases in wealth, he encreases in the esteem and regard of mankind. Let not any one imagine, that this amiable *attorney* is a fictitious character ; it is taken from the life ; and there are doubtless many others, who are equally an ornament to their profession.

The knowledge of an *attorney* ought to be very extensive : he should be acquainted with all the forms of proceeding in the different courts, and with the nature and names of the several actions ; be able to draw up, execute,

cute, and register all instruments or deeds, of what kind soever, and to prepare and conduct all proceedings in law. More particularly, he should be able, from his client's information, and the writings put into his possession, clearly to comprehend his case, and to draw up a compendious state of it. He must then proceed to expedite the proper writ against the adversary; and have him served, or attached, according to the circumstances of the action. He then compels him to appear, or enter an appearance; and enters a declaration against him; a paper containing his client's claim, with a conclusion for the recovery of costs and damages: he next obliges his adversary to answer this declaration; and, if necessary, makes a rejoinder and replication. At last, both parties join issue, and a record is made of all the past proceedings, and a rule of court is entered for trial against a certain day. For this he prepares by drawing up briefs for the council; that is, a short and accurate state of the case, the witnesses names, and the questions to be asked in support of the allegations in the original declaration. After verdict is obtained, he enters upon judgment, and obtains executions against his adversary's person or goods. He must know how to guard against all the after-claps of the law, as writs of error, injunctions, &c. and knowing all the windings and shiftings of this intricate science, guard against all the chicanery and villainy of its professors. From which it evidently appears, that no one can be a good *attorney* who is not endowed with very extraordinary abilities.

ATTORNEY, under this denomination, should be considered also any private person legally authorized by another to pay or receive monies, sue, or transact any other kind of business, in the name of such person who shall appoint him or her their lawful attorney.

This power or authority is transferred to another, by virtue of what is called a *letter of attorney*; which must always be drawn up in a legal manner, suitable to the peculiar nature and circumstance of the case. It is necessary, therefore, that a skilful person should be made choice of, especially in cases of consequence, to draw up such like instruments with judgment and legality; for, by trusting to common general forms, which any blockhead may collect, when suitable variations therefrom are required, is too often the cause of involving traders in great perplexities and expensive law-suits.

In regard to merchants constituting or appointing other persons to transact business in foreign countries, by the way of *attorney* or *procurator*, such instruments of authority should always be drawn up by notary-publics, or exchange-notaries, who are presumed to be persons of judgment, as well as reputation in their profession, and whose names and signatures are well known in foreign nations.

The form of a general letter of attorney from A. B. to C. D.

Know all men by these presents, that I, A. B. of London, merchant, have named and constituted, and by these presents do name, appoint, and make my trusty friend, C. D. of Bristol, merchant, my true and lawful attorney, for me, and in my name, and to my use, to demand, sue for, recover, and receive, of J. W. of Bristol, merchant, the sum of _____ to me due and owing, by and from the said J. W. giving and hereby granting unto my said attorney, my full power and authority to use and exercise all such arts, things, and devices in the law, as shall be necessary for recovering of the said debt; and acquittances, or other discharges, in my name, to make and give; and generally to do and execute in the premises, as fully as I myself might or could do, being personally present; rectifying, confirming, and allowing all and whatever my said attorney shall lawfully do, or cause to be done therein, by these presents.

In witness whereof, I have hereunto set my hand and seal, this _____ day of _____ in the 6th year of the reign of our sovereign lord, George III. of Great-Britain, France, and Ireland, king, defender of the faith, &c.

Sealed and delivered (being first duly stamped) in the presence of A. B.

Provisions made by law to prevent attorneys imposing on their clients.

An attorney, solicitor, or servant to any, shall not be

allowed any fees given to counsel, or for copies, unless he have tickets thereof, signed by the hands of them that receive such fees; and he shall also give unto his client true bills of all the charges of suit under his own hand, before he can charge his client with the payment thereof; and if he delay his client's suit for gain, or demand by his bill allowance for money which he hath not disbursed, the client shall recover against him his costs and treble damages, and he shall be for ever after disabled from being an attorney or solicitor. *Stat. 3. Jac. I. c. 7. s. 1.*

If any person convicted of forgery, or of wilful and corrupt perjury, shall practise as an attorney, solicitor, or agent, in any suit or action, in any court of law or equity within England, the judges of the courts, where such suit or action is brought, shall, on complaint, or information thereof, examine the matter in a summary way, in open court; and, if it shall appear to their satisfaction that the person complained of hath offended contrary to this act, the judges shall cause such offender to be transported for seven years. *Stat. 12. Geo. I. c. 29. s. 4.*

Furthermore, no attorney or solicitor shall commence an action for fees, till the expiration of one month after he shall have delivered to the party a bill of such fees, &c. written in plain English (except law-terms and names of writs) and, upon application of the party, chargeable by such bill, to the chancellor or master of the rolls, or to any of the courts wherein the business contained in the said bill, or the greatest part thereof in value, shall have been transacted; and, upon submission of the said party, to pay the sum, that, upon taxation, shall appear to be due, it shall be lawful for the lord chancellor, &c. to refer the said bill to be taxed by the proper officer, without any money being brought into court; and, if the attorney or solicitor, or client, neglect to attend such taxation, the officer may proceed to tax the bill; which sum, so taxed, being paid, shall be a discharge of the bill: and, in default of non-payment, the party shall be liable to an attachment, or process of contempt, or such other proceeding, at the election of the attorney or solicitor, as such party was liable to; and if, on such taxation, it shall be found, that the attorney or solicitor shall have been overpaid, he shall refund to the party intitled, or to any person by him authorized, if present at the settling thereof, or otherwise as the court shall direct, all the money that the officer shall certify to have been overpaid; and in default thereof, the attorney or solicitor shall in like manner be liable to an attachment, or process of contempt, or such other proceeding, at the election of the party; and the courts are required to award the costs of such taxation, to be paid by the parties according to the event of the taxation, viz. if the bill taxed be less by a sixth part than the bill delivered, then the attorney or solicitor is to pay the costs; but, if it be not less, then the court, in their discretion, shall charge the attorney, or client, in regard to the reasonableness, or unreasonableness of such a bill.

ATTORNEY of the dutchy court of Lancaster, is the second officer in that court, and seems, for his skill in law, to be there placed as *assessor* to the chancellor, and chosen for some special trust reposed in him, to deal between the king and his tenants. *Cowell.*

ATTORNEY general, is a great officer under the king, made by letters patent. It is his office to exhibit informations, and prosecute for the crown in matters criminal; and to file bills in the exchequer, for any thing concerning the king, in inheritance or profits; and others may bring bills against the king's attorney. His proper place in court, upon any special matters of a criminal nature, wherein his attendance is required, is under the judges, on the left hand of the clerk of the crown; but this is only on solemn and extraordinary occasions; for usually he does not sit there, but within the bar, in the face of the court. *Jacob.*

AVA. The empire of *Ava*, including the kingdom of Pegu, lies between Independent Tartary on the north; the Indian sea on the south; Siam on the south-west; part of Bengal and its gulph, on the west; and part of China, Tonquin, and the kingdom of Laos, on the east. The most southern country, that used to be called the kingdom of Pegu, is very fruitful in corn, fruits, roots, and excellent pulse of several sorts, and produces timber for building, elephant's teeth, bees-wax, stick-lack, iron, said to be of so hard a quality that it is almost a natural steel; tin, oil

oil of earth, wood-oil, the best rubies in the world, small diamonds, sapphires, amethysts, and other precious stones. They have abundance of salt-petre, but it is death to export it; and plenty of lead, which passes here for money. About twenty sail of ships find their account in trade for the limited commodities, but the Armenians have got the monopoly of the rubies, which turns to a good account in their trade.

The people wear none of our European manufactures but hats and ribbands; so that the gentry will give extravagant prices for fine beaver hats, and rich ribbands, flowered with silver and gold. Cotton-cloths from Bengal and Coromandel, with some striped silks are best for their market; and silver of any sort is welcome to them. It pays the king eight and a half *per cent.* custom; but, in lieu thereof, he indulges the merchants to melt it down, and put what alloy they please in it, and then to pass it off in payment as high as they can. Rupee-silver, without alloy, will bear twenty *per cent.* of copper alloy, and keeps the Pegu touch, which they call flowered silver; and if it flowers, it passes current. They make flowered silver thus: when the silver and copper are mixed and melted together, they put it, while liquid, into a shallow mould, and blow on it through a small wooden pipe, which makes the part blown up appear with the figures of flowers, or stars; but, if there is too great a mixture of alloy, no figures will appear. The king generally adds ten *per cent.* on all silver that comes into his treasury, besides what was put on at first; and, though it be not flowered, it must go off in all its payments; but from any body else, it may be refused, if not flowered.

Syriam, the only port now open for trade in all the Pegu dominions, is capable of receiving a ship of six hundred tons. The Portuguese, who had this port given them by the king of Arracan, to reward their services to him in his wars, held it many years; but, through their pride and insolence, were obliged in 1614, to quit it, and the trade was restored to the Moors. It drives a good trade with Armenians, Portuguese, Moors, Gentoos, and some English. Their imports are several sorts of Indian goods, as betellas, mulmuls, tanjebbs, and European hats, and silver; and the customs here, which are almost eight and a half *per cent.* amount, with other charges, to twelve in the hundred.

As soon as foreign ships arrive here, the number of people on board, with their age and sex, is sent to the king, to acquaint him, that so many of his slaves are arrived, to partake of the glory and happiness of his reign and favour. See ARRACAN.

AVAST, a sea term, signifying, *stop*, or *enough*.

AUCTION, a kind of public sale, now very much used for every thing, as household goods, books, plate, &c. By this method of sale, the highest bidder is always the buyer.

AUDIT, a regular examination of account, by some proper officer.

AUDITOR, is an officer of the king, or some other great person, who examines yearly the accounts of all under-officers, and makes up a general book, which shews the difference between their receipts and charge, and their several allowances, commonly called *allocations*: as the *auditors* of the *Exchequer* take the accounts of those receivers who collect the revenues. 4 *Inst.* 106. Receivers general of fee-farm rents, &c. are also termed *auditors*, and hold their *audits* for adjusting the accounts of the said rents at certain times and places appointed. And there are *auditors* assigned by the court to *audit* and settle accounts in actions of account, and other cases, who are proper judges of the cause, and pleas are made before them.

AUDITOR of the receipts. An officer of the *Exchequer*, that files the tellers bills, and having made an entry of them, gives the lord treasurer, &c. weekly a certificate of the money received: he makes debentures to the tellers, before they pay any money, and takes their accounts; he also keeps the *black book* of receipts, and the treasurer's key of the treasury, and fees every teller's money locked up in the treasury. 4 *Inst.* 107.

AUDITORS of the *imprest*, are officers in the *Exchequer*, who have the charge of *auditing* the great accounts of the

king's customs, naval and military expence of the *mint*, &c. and any money *imprest*ed to men for his majesty's service. *Pract. Excheq.* 83.

AVENCHES, in *Switzerland*, on a hill near the lake Morat, was the capital of the country of the Helvetians; it has a most delightful situation, and here are found some good remains of antiquity. It is a great pass, and and some years since, the natives have made some plantations of tobacco, which, with those of *Pay-erne*, and its neighbourhood, very near furnish a sufficiency for the canton's consumption, and produce a considerable revenue to the inhabitants, whose soil being very fertile, is likewise abundant in grains and fruits.

AVERAGE and *contribution*, are synonymous terms in marine cases, and signify a proportioning of a loss to the owners of goods thrown over-board in a storm (in order to preserve the remainder, with the ship and the lives of the men) with the proprietors of those that are saved, and of the vessel.

And as ships in their voyages are exposed to storms, and often saved from perishing, by casting goods over-board to lighten them, it has, therefore, been always allowed, and is justified both by laws and custom, and in case of imminent danger, any thing may be thrown away to evade it; though as heavy goods seem most likely to answer the purpose, and are generally least in value, they should be first destined to destruction.

However, to make this action legal, the three following essential cases ought to concur.

1st. The ship must be in evident hazard of perishing, with her cargo and crew.

2d. The resolution the captain takes on this melancholy occasion, should be in consequence of a consultation held with his officers and sailors, to endeavour to save themselves, ship, and cargo, either by throwing some goods over-board, or by cutting some of the masts, &c. away, and by occasioning these extraordinary expences, strive to secure the remainder for the proprietors benefit.

3d. That the ship and cargo, or the parts of them that are saved, have been saved by the means used, with that sole view.

Agreeable to these three axioms, it must be concluded, that all the expences and losses, which are thus voluntarily made to prevent a total one of ship and cargo, ought to be equally borne, by the ship and her remaining loading.

But all that which is broken or lost by a storm, as anchors, cables, masts, sails, cordage, &c. is not to be comprehended in common *averages*, because the tempest only was the occasion of this loss, and not made by the deliberation of the master and his crew, with the view to save the ship and loading; though on the contrary, if after advice taken by the company, or major part of them, the captain cuts away, or abandons any thing of the ship or cargo, with a view to prevent a greater misfortune, all that which is so cut away, &c. must be brought into an *average*.

If the ship happily out-weather the storm, and arrives in safety at her destined port, the captain must make his regular protests, and besides, *jointly* with the major part of his crew must swear, that the goods were cast over-board for no other cause, but purely for the safety of ship and lading; and the method of elucidating and clearing up this point, varies according to the several countries, and places they arrive at.

The ship arriving in safety, those goods she brings with her, must come into an *average*, and not only those that pay freight, but *all* that have been saved and preserved by such *ejection*, even money, jewels, clothes, &c. are not exempted. But a man's apparel in use, victuals, &c. put aboard to be spent, are totally excluded from the contribution.

In the rating of goods by way of contribution, this order used to be always observed, viz. if they are cast over-board before half the voyage be performed, then they are to be estimated at the price they cost; and if after, then at the price as the rest, or the like sorts, shall be sold at the place of discharge; and this regulation continues still in France and Holland, though here and elsewhere, the lost and the saved are sometimes estimated

as the latter sell for. *Joh. Locinius, lib. ii. cap. 7. de Jactu*; and 8 *de Contribut.*

The owner of the goods that have been thus ejected, or his factor, should take care to have the loss valued before the ship's discharge, in which the master ought to assist, and settle all averages before he unloads.

And it is not only the goods that are thrown over that must come into the *average*, but those also which shall have received any damage, by the action of the others' ejection, by wet, &c. *Leg. Navis 4. ad Leg. Rhod. and Venius's comment, fol. 235.*

If goods shipped in England are in a tempest thrown over-board, in order to preserve the vessel and crew, and these goods are taken up and preserved by another English ship, the owners bring *trover*, it lies, because delivered upon the land. 2 *Roll's Rep.* 498. *Caps v. Tooker.*

It is lawful for persons to cast goods over-board, out of a ferry-boat, in case of a tempest, to preserve their lives; but if the ferry man surcharge the boat with goods, the owners of them shall have their remedy against him, but no otherwise. 12 *Coke* 63. 2 *Bulstr.* 280.

So if an ejection of goods from any ship, is occasioned by the indiscretion of the master's lading her above the *birth-mark*, it is customary in such cases, by the marine laws, to have no contribution made, but satisfaction is due from the ship, masters, or owners. *Lust. Sernus. S. 27 and Si. 23. ad Leg. Aquil.*

And as this law doth take care, that such common calamities shall be borne by all the interested parties, by a general contribution, so the *common law* takes notice of the misfortune, and makes provision for the masters' indemnification; and therefore if the owner of such ejected goods, shall bring an action against the owner or the master of the vessel, the defendant may plead the special matter, and the same shall bar the plaintiff.

As the common law looks upon the goods or cargo as a pawn or pledge for the freight, so the marine law looks upon them likewise as a security for answering any *average* or *contribution*, and that the master ought not to deliver them (*as above*) till the *contribution* is settled, they being tacitly obliged for the one as well the other. *Ad Leg. Rhod. lib. ii.*

If a lighter, skiff, or the ship's boat, into which part of the cargo is unladen, to lighten the ship, perish, and the ship be preserved, in that case contribution is to be made; but if the ship be cast away, and the lighter, boat, or skiff, be preserved, there no *contribution* or *average* is to be had, it being a rule, *no contribution but where the ships arrive in safety.* *F. de Leg. Rhod. Leg. Navis must. Leg. Navis ad. Leg. Rhod. de Jactu. Moor* 297.

If a ship be taken by enemies or pirates, and the master, to redeem her and cargo, promises a certain sum of money, for performance whereof he becomes a pledge or captive in the hands of the captor; in this case he is to be redeemed at the expence of the ship, lading, and money (if any on board) all being obliged to contribute for his ransom, according to each man's interest. *Leg. Rhod. de Jactu. lib. ii. Si. Navis a Piratis.*

So where a pirate takes part of the goods, to spare the rest *contribution* must be paid. *Moor f. 297. pl. 443. Hicks v. Palington.*

But if a pirate takes by violence part of the goods, the rest are not subject to *average*, unless the merchant hath made an express agreement to pay it after the ship is robbed: though if part of the goods are taken by an enemy, or by letters of mart or reprisal, *e contra.* *Grot. de Introd. Jur. Holl. p. 29.*

In settling an *average*, an estimate must be made of all the goods lost and saved, as well as of what the master shall have sacrificed of the ship's appurtenances to her preservation, and that of her cargo; and if any thing flung into the sea, is again recovered, *contribution* is only to be made for the damage it shall have received. *Pekeus ad Leg. Rhod. de Jactu. fol. 196, 197, 198.*

The pilot's fee that brought the ship into port or haven, for her safeguard (it being not the place she was designed for) must be contributed to, as the raising her from the ground must be, when there is no fault in the master.

If a master of a ship lets her out to freight, and in consequence thereof receives his loading, and afterwards

takes in some goods, without leave of his freighters, and on a storm arising at sea, part of his freighter's goods are thrown over-board, the remainder are not subject to an *average*; but the master must make good the loss out of his own purse. *Grot. de Intro. Jur. Holl. 329. Venius and Peckeus Com. on the laws of Rhod. fol. 236.*

If a ship is taken by force and carried into some port, and the crew remains on board to take care of, and reclaim her, not only the charges of such reclaiming shall be brought into an *average*, but the wages and expences of the ship's company during her arrest, and from the time of her capture and being disturbed in her voyage. *J. P. Ricard. Le Negoce d'Amsterdam, p. 279.*

But the sailors' wages, &c. of a ship detained in port by order of state, shall not be brought into an *average*, and the reason assigned for it is, that in the preceding case, the crew remained aboard to take care of the vessel, whilst they were endeavouring to reclaim her, and these charges were occasioned with the sole view of preserving the ship and cargo for their proprietors; but in this latter case, there was no room for such a pretence, as the embargoing sovereign would not have either ship or cargo, but only hinder their departure for some political reasons, wherefore it could not be said that the ship's company remained on board to prevent an intire loss; the only motives to be offered for an *average.* *Ditto, and he from Mr. Adriaan Verwer on the marine laws of the Low Countries.*

Nevertheless, it seems that both reason and justice require that the expence and wages of a ship's company detained in port by a prince's order, should be brought into a general *average*; for if, on one side, the merchants who have loaded her, are considerable sufferers by the delay, in the arrival of their goods at the destined ports, the owners of the ship are not less so, more especially if the crew is large, and the detention long; and those who drew up the ordinance of Lewis XIV. very well perceived in part, that to oblige the owners of a vessel so detained, to support the whole expence, would be a great hardship and injustice, as the seventh article of the said ordinance (under the title of *averages*) expresses in direct terms, viz. "The food and wages of sailors, belonging to a ship embargoed by an order of state, shall be also reputed as part of general *averages*, if she is hired by the month; but if she is freighted by the voyage, they shall be borne by her alone."

From whence, we should think it ought to be concluded, that although a ship freighted by the month or voyage, is only mentioned in the foregoing, yet when the proprietors of a vessel hire her crew by the month, they have a right to bring the expence and wages of their sailors into an *average*, for the whole time that the ship shall be detained; though, on the contrary, they cannot justly pretend to bring the expence of the mariners into an *average*, when they are hired for the voyage, as the expence only is always the same, whether they be hired by the month or voyage, and being occasioned by the will of the sovereign who laid the embargo, we do not see that there ought to be any distinction, unless there were some goods aboard, which were the cause of her arrest; for in this case it would be reasonable, that the said merchandizes should pay the whole expence.

Though it should be noted, the charges of unloading a ship, to get her into a river or port, ought not to be brought into a general *average*, but when occasioned by an indispensable necessity to prevent the loss of ship and cargo; as when a ship is forced by a storm to enter a port to repair the damage she has suffered, if she cannot continue her voyage without an apparent risque of being lost; in which case, the wages and victuals of the crew are brought into an *average* from the day it was resolved to seek a port to refit the vessel, to the day of her departure from it, with all the charges of unloading and reloading, anchorage, pilotage, and every other due and expence, occasioned by this necessity.

The master of a ship, who is obliged from the foregoing motives, to cut away, or throw over-board, any of his masts, rigging, &c. has a privileged hypothecation, and the right of detention of the goods he shall carry to their destined port, till they contribute to a general *average*; and it is to be observed, that goods cast over-board to lighten the ship, make no *derelict.* 5 *Co.* 107. b.

Petty AVERAGE, is a small duty joined to *primage*, which custom has made a master's perquisite, *extra* of the freight, and is commonly here five *per cent.* as it has been settled in France and Holland, &c. though ten *per cent.* is commonly paid in this latter, notwithstanding two public edicts which limit it to half the sum: the origin of it was, an allowance made to masters of vessels for sundry petty expences, to which the loading was obliged to contribute, but has been for some years past transmuted to the terms aforesaid. *See more upon the subject of averages under the title of INSURANCE; also see the article AMSTERDAM, under which head the regulations of the DUTCH INSURANCES are amply treated.*

AVIGNON-BERRY, the fruit of a shrub, produced in great plenty near Avignon in France, somewhat less than a pea, of an astringent and bitter taste, its colour green, inclining towards a yellow. It is much used by dyers and painters.

AUNCÉL-WEIGHT, (*quasi, hand sale weight*, or from *ansa*, the handle of the balance.) An ancient manner of weighing, by the hanging of scales or hooks at each end of a beam or staff, which by lifting up in the middle with one's finger or hand, discovered the equality or difference between the weight at one end, and the thing weighed at the other. This method of weighing being subject to great deceit, was prohibited by several statutes, and the even balance commanded in its stead, as 25 *Edw. 3. ft. 5. c. 9.* 34 *Edw. 3. c. 5.* 8 *Hen. VI. c. 4.* and 22 *Car. 2. c. 8.* But notwithstanding it is still used in some parts of England; and what we now call the *stiliards*, a sort of hand-weighting among butchers, being a small beam, with a weight at one end (which shews the pounds by certain notches) seems to be near the same with the *auncel-weight*. *Cowell. Jacob.*

AUNIS, the smallest province in France, is bounded on the west by the ocean; on the north by Poictou, from which it is separated by the river Sevre; and, on the east and south, by Saintonge. This province is very fruitful, and well peopled.

Rochelle, in this province, has been always a very considerable port and trading-town. Without the leave of the governor of the tower of the Chain, no vessel can enter into the harbour. They drive here a considerable trade into the islands of America; and the English, the Dutch, the Swedes, and the Danes, send here yearly a vast number of ships, to load wine, brandy, salt, paper, and linen cloths. The merchants here send all the necessaries of life into America, and bring back from it its products. Their chief manufacture here is the refining of sugar; they have also set up of late a manufacture of earthen-ware, which succeeds very well. Here is a sovereign court for the salt-marshes in the west, and a court of the mint.

AVOGASIA, part of Mingrelia, is abundant in flax, hemp, pitch, wax, and honey, though this last is commonly bitter, by reason of the bees gathering it from the box and yews that grow here in plenty. Vermillion is found in an almost inaccessible rock; and it is in several parts of this province, that the true rhapsodic is met with, which many take for rhubarb, and what dishonest drug-gifts sell for it.

AVOIRDUPOIS-WEIGHT, a kind of weight used in England, the pound of which consists of sixteen ounces. This is the weight for the larger and coarser commodities, as groceries, cheese, wool, lead, hops, &c. Bakers who live not in corporation towns are to make their bread by *avoirduois-weight*; those in corporations, by troy-weight. Apothecaries buy their drugs by *avoirduois-weight*, but sell by troy.

AURICHALCHUM, among the modern writers, signifies a fictitious metal, commonly called brads. It is a mixture of copper and calamine-stone, melted together by a very fierce fire.

AURIPIGMENTUM, or ORPIMENT. *See ARSENIC.*

It is commonly used by painters for a gold colour, and as a depilator, with quick-lime, at the bagnios; it is also an ingredient in the making of shot, and in the sympathetic inks, which, by their fumes, render certain invisible inks conspicuous. We have seen it in stalks of a most vivid, beautiful red, green, and yellow transparent colours, brought from abroad, in hopes of obtaining

gold from it; but the experiment did not answer.

AURUM, gold. *See GOLD.*

AURUM fulminans, in chemistry, a preparation of gold, made by dissolving gold in *aqua regia*, and precipitating with oil of tartar, after which the powder must beedulcorated and dried in the shade.

The powder thus prepared is more in quantity than the gold that was employed by one fourth of its weight. If it be heated beyond a certain degree, which is a very mild one, it goes off with a loud explosion, and this whether the heat be given it by fire, or by only rubbing it too violently. This effect is prevented by adding a larger quantity of oil of tartar than is necessary in the preparation.

It is sometimes given inwardly as a diaphoretic; but it may be more truly said to relax the intestines, as was observed by Ludovicus and Koning, who affirm that this preparation being given in fevers, in which the patient inclines to a diarrhæa, promotes that discharge, and on that account sometimes proves fatal. *Geoffroy.*

AURUM potable, or tincture of gold, a medicine formerly of great request, but at present rarely if ever used. It is prepared by mixing essential oil of rosemary, with a solution of gold in *aqua regia*, and after shaking the vessel, the gold will be retained in the oil, swimming on the top. This oil is separated by inclination, and afterwards digested for a month in highly rectified spirit of wine.

But, after all, this is not a genuine tincture of gold, being only the gold divided into very small parts by the spicula of the *aqua regia*, swimming in the oil of rosemary; nor can there be any radical tincture of gold, which may not, by evaporating the oil, be reduced to a powder, and the powder by melting reduced into gold. The virtue of this tincture are entirely owing to the oil of rosemary.

AUSTRIA, an archduchy in Germany, has Hungary on the east, Bavaria on the west, Bohemia on the north, and Styria on the south. It is a plentiful country, and produces a great quantity of corn and pasture, and of better saffron than what comes from the Indies, besides all other necessaries. It is commonly distinguished by geographers into *Upper and Lower Austria*, and indeed is naturally so divided by the river Ens, which falls into the Danube. We shall take a cursory view of such of its divisions, towns, and places, as are most remarkable for trade and commercial articles.

Lintz, the capital of *Upper Austria*, has an excellent manufacture of gun-barrels, a good trade in linen cloth, and two fairs at Easter and Bartholomew-tide, much frequented by foreigners. From this place to Munich, are many plantations of hops.

Gemund, a town at the mouth of the Draun, where it falls into the Gemunder-lake, has a considerable trade in salt, which is made at Halstadt in the neighbourhood, brought hither by the lake, and exported as far as Vienna, which is a hundred and eighteen miles from hence.

Krems, a city forty miles west of Vienna, has a great trade, especially at its two yearly fairs, which begin on St. James's and St. Simon and St. Jude's days, hold each a fortnight, and are frequented by merchants and tradesmen from all parts of Germany, Bohemia, Moravia, Hungary, and Poland.

The duchy of *Styria*, lying between Austria and the Save, abounds with wine, fruit, mines of iron, salt, and such plenty of corn, that they want vent for it. But the Upper Styria has no wine, so that they barter wool, butter, cheese, &c. for it, with Lower Styria.

Eisenartz, forty miles north-west of Gratz, is famous for its mines and forges of iron, from whence it has its name. The mines were discovered in 712, and have been worked ever since, without any sensible decay.

They employ nineteen mills on two small rivers in the neighbourhood, with a vast number of labourers, who live here, and supply the neighbouring parts with this metal, and all Germany with steel. Here is a yearly fair, where hemp, leather, tallow, and all necessaries, are bartered for their iron and steel. Their works were formerly managed by nineteen officers; but the emperor Ferdinand II. incorporated these mines of Styria and those of Austria, under a lieutenant.

Lower Austria

Styria

Tyrol has *Swabia* and *Bavaria* on the north, the *Grifons* and *Trent* on the south, *Carinthia* on the east, and *Switzerland* on the west. Here are mines of silver, iron, and copper, but the latter much short of what they were formerly, when they constantly employed 30,000 people, but now not 2000. From these mines of metal, and others of salt, the emperor has a considerable revenue.

At *Innsbruck*, the capital of *Tirol*, was formerly made great store of salt, but for some years past the pits have been dry, which is reckoned a loss to the city of no less than 200,000 florins a year.

Halle, the second city of *Tirol*, is famous for its salt-works, where several hundred men are constantly employed, either in the works, or cutting fuel for them. The chief of them are in the mountains, four miles from the town; but the water the salt is made of, after having stood a month there in the trenches, is brought to the town by troughs, to be boiled in great pans or cisterns, each forty-eight feet long, thirty-four broad, and three deep. Three of them are continually boiling, and one of them rests a week alternately. These salt-works, and a mint established here, have rendered this town, though so near to *Innsbruck*, almost as populous as that capital. Here they can coin a great quantity of specie from the silver and copper taken out of the mines of *Tirol*, in which, it is said, seven thousand men, women, and children, are constantly employed, and the water is brought to it by wooden pipes. They drive also a great trade in copper and tin, as well as salt; the vent whereof is much promoted by the river *Inn*, which here becomes navigable.

Bolzano, as it is called by the Italians, or *Pozen* by the Germans, twelve German miles from *Innsbruck*, is a place of good trade, especially at its four yearly fairs, which hold each a fortnight, and to which great numbers of merchants resort from Germany, Switzerland, and Italy, for whose sake great privileges have been granted to the city. During these fairs, merchants are allowed magistrates and judges of their own, distinct from those of the town; and none are permitted to trade, without being entered in the judges books, and a certificate of the entry under the seal of the corporation.

At *Roveredo*, on the east side of the *Adige*, eleven miles south of *Trent*, and twenty-nine north of *Verona*, the most remarkable thing, and what they call the great wonder at *Roveredo*, is its spinning-house for the manufacture of silk, in which they have a great trade here; a fabrick being erected to carry it on upon the banks of a little brook, which turns a large wheel that communicates motion to a machine within the house, that spins raw silk without any body's touching it, farther than to set it a going; and it is remarkable, that it throws or winds off at least six hundred pounds weight of silk at once, so that it makes a prodigious quantity in a day. When this silk is died, it is manufactured into satins, damasks, velvets, and other stuffs, which are sold at the fairs of *Bolzano*, and from thence transported to Germany.

At *Trieste*, on the *Adriatic-Sea*, a sea-port belonging to the imperial hereditary dominions, are made great quantities of salt, and exported; and the neighbouring country produces good wine, called by the Germans *reinfaul*, which the Venetians buy cheap, and sell for exportation. Here is a large harbour, but it is only frequented by small vessels, just to cross over to *Venice*; though the emperor *Charles VI.* who had no other sea-port in all his hereditary dominions before the treaty of peace at *Rastadt*, which threw Italy, Sicily, and the Spanish Netherlands into his hands, made this a free port, and gave great encouragement to the ships and merchants of all nations to come to it, designing to make it the center of the Austrian commerce in these parts of the world. But the merchants of *Trieste* not having a stock, the Venetians themselves came among them, and carried on that very trade for them, by which they were so sanguine at one time, as to think of supplanting even *Venice* itself: for from this port the Venetian merchants struck into a new commerce, by the river *Savo* to *Belgrade*, and thence to *Sinope* in the *Black-Sea*, and likewise to *Constantinople*; and the most that it appears the Germans have yet done here is, to

send some ships among the *Archipelago Islands*, from whence they bring back wines, cotton-yarn, fruits, and some silk, program-yarn, camels hair, and such goods. But the great misfortune which the Austrians laboured under for carrying on the great trade proposed from this port was, that they had no fund of goods for exportation, either of their produce or manufacture; the chief they could export of any value, being the wrought-iron made in *Carinthia*, *Styria*, and the adjacent countries, which is indeed of great service to the Venetians, because they have no iron works near them. Upon the whole, therefore, the trade of this new free port is not likely to answer the end proposed; yet the merchants here keep up their expectations of trade, and not long since talked of erecting some manufactures of wool and silk, that they might have something more to export besides iron.

The house of Austria have a noble revenue from the rich wine made and sold at *Proseg*, which is about seven miles north-west of *Trieste*.

The AUSTRIAN NETHERLANDS, consisting of the duchies of *Luxemburg*, *Limburg*, and *Brabant*, the earldoms of *Namur*, *Hainault*, and *Flanders*; the marquise of the holy empire, and the lordship of *Mechlin*, are bounded by the United Provinces on the north, by Germany on the east, by French *Flanders*, and by *Lorraine*, *Champaign*, and *Picardy*, on the south, and by another part of *Picardy* and the English sea on the west. The soil is generally fruitful, but differs in the several parts. The climate also differs in the several provinces, but not much from that of England, though the seasons are more regular. The face of the country is low and flat, and no hill is to be seen in all the Netherlands in general, which is the reason that they have been called the *Low Countries*.

The Spaniards continued possessed of almost eight of the provinces of the Netherlands, until the duke of *Marlborough*, general of the allies, gained the memorable victory of *Ramillies*. After which *Brussels*, the capital, and great part of these provinces, acknowledged *Charles VI.* (afterwards emperor) their sovereign; and his daughter, the present empress queen, remained possessed of them till the war that preceded the last, when the French made an entire conquest of them, except part of the province of *Luxemburg*; but they were restored by the peace of *Aix-la-Chapelle*, in the year 1748, and the French retain only *Artois*, the *Cambresis*, part of *Flanders*, part of *Hainault*, and part of *Luxemburg*, of which they have had the dominion now upwards of eighty years.

The Austrian Netherlands were once the center of the woollen manufactures, which we have now the satisfaction to call the English manufactures, but originally derived from the Flemings, whose country was thereby immensely populous and enriched. The materials for these manufactures, particularly the wool and the fuller's-earth, they had from England. The English did not see their error till about the year 1450, when they began to think, that these manufactures might as well be carried on in England as in Flanders, and their own people employed in this prodigious scene of traffic, to the enriching of themselves rather than their neighbours. On these motives they wisely put a stop to the exportation of wool, and the cloathing was gradually encouraged in England, by the means of manufacturers obtained from the Netherlands, to instruct our people. The Flemings, being thus deprived of their fund of wool, were obliged to turn their hands to other things; which brought them to the making of lace and linen, to silk-weaving, and to other business of various kinds; so that the manufactures carried on in these provinces at present, are, 1. Lace, known by the name of bone-lace, of which the finest and best of the kind in Europe, is said to be made at *Brussels*. 2. Fine thread. 3. Linen, consisting chiefly of cambricks and lawns. 4. Woollen, which includes the tapestry made at *Arras* and the adjacent country. 5. Silk, of which at present they make not only sufficient for their own use, but for exportation. This domestic trade necessarily creates a great foreign one, where the situation will admit of it; and so considerable are the exports of these manufactures, that very good judges have estimated them at no less, in fine thread, bone-lace, and linen, including their lawns and cambricks, than to the value of two millions sterling a year.

In regard to industry, the Netherlanders are an example to the whole world. Nothing can live where they starve, and nothing is idle among them that can sustain any degree of labour. The universal navigation of the rivers and canals passing through innumerable cities and populous towns, implies, that there must be a great inland traffic; and this, indeed, in proportion to the extent of territory, is a prodigious business.

AUTHORITY. That power of acting which one man has, being transferred to another, is called an *authority*, and this the law allows of; for as a contract is no more than the consent of a man's mind to a thing, if such consent or concurrence appears, it would be very unreasonable to oblige him to be present at the execution of every contract, since it may be as well performed by any other person delegated for that purpose. But such delegation or *authority* must be by deed, that it may appear, that the attorney or substitute had a commission or power to represent the party; also that it may appear, that the *authority* was well pursued.

One who has an *authority* to do an act for another, must execute it himself, and cannot transfer it to another; for this being a trust and confidence reposed in the party, cannot be assigned to a stranger whose ability and integrity were not so well thought of by him for whom the act was to be done; therefore an executor having *authority* to sell, cannot sell by attorney. 9 Co. 77. b. 1 Rol. Abr. 330.

AUTOMATON, a self-moving machine; or whose principle of motion is within itself, as a clock, watch, &c.

AUVERGNE, a province in France, is bounded on the north by Bourbonnois; on the east by Forez; on the south by Rouergne and the Cevennes; and on the west by Upper Limosin, Quercy, and la Marche.

This province is commonly divided into High and Low, and the products of each are as different as their situation: the first is mountainous, as the distinction seems to speak it, and productive of nothing but food for cattle, of which here are bred surprizing numbers; and the low lands abound in corn, wine, hemp, and walnuts; their meadows are delightful, and so fertile, that those in the neighbourhood of Riom and Clermont, are mowed three times a year, and the lands in general never lie idle, or at most are not fallowed above one year in twenty.

There are several sorts of manufactures in the Avergnais, and almost all the different species fabricated are of a very good quality, but more especially the paper, which is excellent, made chiefly at Ambret, and about Thiers and Clermont. The manufactures of estaminas, woollen camlets, and other stuffs, are at Ambret, Culnhac, Oliergue, Sanxillanges, and St. Flour, making in all about 10,000 pieces. Laces are made at Aurillac, to the annual value of 200,000 livres (though formerly they produced near 800,000) and there are some made at Muret, la Chaîsse-Dieu, Alarche, and Vineroles. The hardware of Thiers and its neighbourhood, affords subsistence to above 5000 families; and cards for play are made here and at Ambret. The tanneries of Clermont, Riom, St. Flour, Manisgues, Anjou, Chaudes-Aigues, &c. are very considerable; as the dairies near Aurillac, Moriac, Volers, Beze, la Tour, and Ardes, are in cheese. Many fine mules and good horses are bred in the studs of the province, which, besides the foregoing particulars, produces masts for ships, and wood for carpentry, coals, fruit, wax, glue, tallow, butter, linen, hemp, and nut-oil.

AWARD, is the judgment and arbitration of one or more persons, at the request of two parties who are at variance, for ending the matter in dispute, without public authority; and may be called an *award*, because it is imposed on both parties to be observed by them, *Dictum, quod ad custodiendum, seu observandum, partibus imponitur.* Spelm.

An *award* may be by word or in writing, but is usually given in the latter, and must be exactly according to the submission. If an *award* be according to the submission by bond, though it is void in law, if it be not observed, the obligation will be forfeited. 1 Danv. Abr. 515.

Where arbitrators *award* a thing against law, it is void;

if more is *awarded* than submitted, the *award* will be void; but when an *award* seems to extend to more than in the submission, the words *de et super præmissis*, restrain it to the thing submitted. Cro. Eliz. 861.

An *award* may be void in some part, and good in another part, if it makes an end of all the differences submitted; and if an *award* be good in part, and void in part, the good shall be performed. 10 Rep. 13. 2 Saund. 293.

An *award* without a deed of submission will be good, bar of a trespass. Danv. 548.

But the delivery of the *award* in writing, under hand and seal, &c. must be pleaded, and be exactly replied to by the plaintiff, in action of debt on an *award*, or it will be ill on demurrer. Dyer 243. 2 Mod. 77, 78, 269.

The submission to an *award* may be by bond, covenant, or by an *assumpsit* or promise, or without all this, by a bare agreement, to refer the matter to such a person or persons. 10 Rep. 131. Dyer 270.

A husband may submit to an *award*, for himself and his wife, for her goods and chattels, to bind her; but an infant may not make any submission to an *award*, or any other for him, for it will be void. Plowd. 189.

If several persons do a wrong to a man, and one of these, and he to whom the wrong is done, submit to an *award*; the other persons who were no parties to the submission, may take advantage of it, to extinguish the wrong. 7 Hen. IV. 31.

And where the *award* of recompence for a wrong done, is performed, that wrong is altogether determined; also the *award* of a personal chattel, doth alter the property of it, and give it to the party to whom *awarded*, that he may have *detinue* for it. Dyer 183.

A submission is of all actions and demands, &c. though there be but one cause or matter between them; an *award* may be made for this: and where two things are submitted, and the *award* but one, it is good, if the arbitrators have no farther notice of the other; though if it be of three things, or some particulars with a general clause of all other matters, in that case they must make the *award* for the things particularly named, without any other notice given. Dyer 216. 2 Cro. 130. Godb. 146.

If the submission be by diverse persons, and the arbitrators *award* between some of them only, this is good; but if a submission is of certain things in special, with a *proviso* in the condition, that the *award* be made of the premises, &c. by such a day, there the *award* must be made of all, or it will be void. 8 Rep. 79. Hob. 49.

An *award* of all actions *real*, when the submission is of actions personal, is not good. Plowd. 306. 10 Rep. 132.

Yet if the submission be of things *personal*, and the *award* is, that one of the parties shall do an act *real*, in satisfaction of a personal injury, &c. or a submission be of one thing, and the *award* made of something incident to, or necessarily depending upon it; or if the submission is of all actions *real* and *personal*, and the *award* only of matters *personal*, &c. it will be good in these cases, if nothing else is notified to the arbitrators. Dyer 216.

An *award* made only on one side, without any thing on the other, is void in law; as that one shall pay or give bond for money to the other party, and he do nothing for it; but if it be to give bond to pay, or to pay a debt, and that the other shall be discharged of the debt, &c. this is good; so where it is that one party shall pay money to the other, and then the other shall release all actions to him. 8 Rep. 72, 98.

If diverse trespasses be referred to arbitrament, and the *award* is, that one of the parties shall make the other parties amend, or give a release, and say not what amend or what release, &c. it is void for uncertainty. 5 Rep. March 18.

Award was, that each party should give to the other a general release of all demands, provided, that if either of them dislike the *award*, within twenty days after made, and within that time pay ten shillings, the arbitrament to be void; it was held, that the first part of the *award* was good, and the *proviso* repugnant and void. 1 Cro. 688.

Arbitrators are to make their *award*, *secundum allegata & probata* (according to what is alledged and proved) but they may not enjoin any oath to the witnesses; the *award* ought to be published; and no one is bound to perform, till he can know what the *award* is. 4 Rep. 82. *Brownl.* 311.

A submission to *award* may be revoked, and countermanded before the *award* made, where there is no specialty to abide the *award* of J. S. &c. 8 Rep. 78. 81.

A submission was to an *award* by bond, and at the end of the condition of the bond, was this clause; "and if the obliger shall consent that this submission shall be made a rule of court, that then, &c." upon motion to make this submission a rule of court, it was opposed, because these words do not imply his consent; but if he would forfeit his bond, he need not let it be made a rule of court: yet because this clause could be inferred for no other purpose, the court took the conditional words to be a sufficient indication of consent, and made the *award* a rule of court. *Salk.* 72, pl. 8.

A matter was referred by consent at *nisi prius*, to three foremen of the jury; and before the *award* was made, one of the parties served the arbitrators with *subpœna* out of chancery, which hindered their proceeding to make the *award*. And the court held this a breach of the rule, and granted an attachment *nisi causa*. *Salk.* 73. pl. 10. *Farresley* 8.

Upon a submission to the *award* of the three foremen of the jury, who made their *award*, the defendant moved to set it aside; because they went on without giving him time to be heard, or to produce a witness; and *Holt*, chief justice, said, the arbitrators being judges of the party's own chusing, the party shall not come and say, they have not done him justice; and put the court to examine its *aliter*, where they exceed their authority; however, the *award* was examined and confirmed, and the plaintiff moved for an attachment for not performing it; and the court held, that the non-performance while the matter was *sub judice*, was no contempt; then the plaintiff moved for his costs, and that was denied; upon which *Powell*, justice, said, that seeing they could not give the party any costs, he should never be for examining into *awards* again. *Salk.* 73. pl. 11.

H bound himself in a bond to stand to the *award* of J. S. which submission was made a rule of court. The party, for whose benefit the *award* was made, moved the court for an attachment of non-performance, which was granted; pending that, he brought an action of debt upon the bond; upon this, serjeant *Darnell* moved, that he might not proceed both ways, and likened it to the cases, where the court stays actions on the attornies bills, while the matter is under reference before the master; *sed per curiam*, the motion was denied, and this difference taken; where the court relieves the party by way of amends in a summary way, as in the case cited, there it is reasonable; otherwise here, where the plaintiff has no satisfaction upon the attachment, and the defendant was put to answer interrogatories. *Salk.* 73. pl. 12.

Attachment lies not, for not performing an *award* made upon a rule of court, without a personal demand. *Holt*, chief justice, remembered the first attachment of this kind, was in Sir John Humble's case, in Keyling's time, in which, and ever since, a personal demand has been thought necessary. In such cases of *awards*, though they be not legally good, an attachment lies for non-performance; *aliter*, if impossible; but the party is excused as to that part which is impossible only. *Salk.* 87. pl. 1.

Debt, an obligation to perform an *award*, which was, that the defendant should enjoy a house, of which the plaintiff was lessee for years, during the term, paying to the plaintiff twenty shillings yearly: and for non-payment of this, the action was brought; and it was held to lie. 1 Cro. 211.

The form of an award made by two arbitrators on a submission.

TO ALL PEOPLE to whom this present writing indented of *award* shall come. We E. F. of &c. and G. H. of &c. send greeting. Whereas there are several accounts depending, and diverse controversies and dif-

putes have lately arisen, between A. B. of &c. of the one part, and C. D. of &c. of the other part, touching and concerning, &c. And whereas for putting an end to the said differences and disputes, they, the said A. B. and C. D. by their several bonds or obligations, bearing date, &c. are reciprocally bound each to the other, in the penal sum of &c. to stand to, abide, perform, and keep the *award*, order, and final determination of us, the said E. F. and G. H. arbitrators, indifferently chosen, between the said parties, to arbitrate, &c. (as in the bond) so as the said *award* be made in writing, under our hands and seals, and ready to be delivered to the parties in difference, on or before &c. next, as by the said in part recited bonds, or obligations, with the conditions thereunder written may appear. Now know ye, that We the said arbitrators, whose names are here unto subscribed, and seals affixed, taking upon us the burden of the said *award*, and having fully examined, and duly considered the proofs and allegations of both the said parties, do, for the settling amity and friendship between them, make and publish this our *award*, by and between the said parties, in manner following, that is to say, *first*, We do *award* and order, that all actions, suits, quarrels, and controversies whatsoever had, moved, arisen, or depending, between the said parties in law or equity, for any manner of cause whatsoever, touching the said premises, to the day of the date hereof, shall cease and be no farther prosecuted; and that each of the said parties shall bear and pay his own costs and charges, in any wise relating to, or concerning the same premises; and we do also *award* and order, that the said A. B. shall pay, or cause to be paid to the said C. D. the sum of &c. within the space of &c. And farther, we do hereby *award* and order, that the said C. D. shall, on or before &c. pay or cause to be paid to the said A. B. the sum of &c. or give sufficient security for the same to the said A. B. And *lastly*, we do *award* and order, that the said A. B. and C. D. on the receipt of the several sums of, &c. shall in due form of law, execute each to the other of them, or to the other's use, general releases, sufficient in the law, for the releasing, by each to the other of them, his heirs, executors, and administrators, of all actions, suits, arrests, quarrels, controversies, and demands whatsoever, touching or concerning the premises aforesaid, or any matter or thing thereunto relating, from the beginning of the world to the day of the date, &c. (here mention the date of the arbitration bonds) last past. In witness whereof we have hereunto set our hands and seals, the &c. in the year &c.

An umpirage, for want of a determination by arbitrators chosen.

TO ALL &c. I J. K. of &c. send greeting. Whereas there are several accounts depending, &c. (here go on as in the former *award*, until you come to) to stand to, &c. the *award*, order, and final determination, of E. F. of &c. and G. H. of &c. arbitrators, indifferently chosen, between the said parties, to arbitrate, &c. (as in the conditions of the bonds) so as the said *award* was made in writing, under the hands and seals of the said arbitrators, and ready to be delivered to the parties in difference, on or before &c. last past; and if the said arbitrators did not draw up the said *award* in writing, and deliver the same as aforesaid, on, or before the said &c. then the said parties were to stand to, abide, observe, perform, and keep the *award*, umpirage, final end and judgment of me, the said J. K. umpire indifferently chosen, between the said parties, for the composing and ending of the differences aforesaid; so as my said *award*, umpirage, and determination be made in writing, under my hand and seal, and ready to be delivered to the said parties, on or before &c. as by the said in part recited bonds or obligations, with the conditions thereunder written may appear. And whereas the said E. F. and G. H. did not make up their said *award* between the said parties, within the time limited by the said in part recited bonds or obligations, as aforesaid; whereby, and on which account, the compassing, ending, and determining, of the said differences and matters in dispute now depends wholly upon me. Now KNOW YE, that I, the said J. K. having taken upon me the business and charge of the said

award and umpirage, and being willing to set the said parties at peace and concord, by making a final end of the controversies between them; and having deliberately and at large heard, examined, and duly considered the grievances, allegations, titles, vouchers, and evidences of both the said parties, in relation to the said premises in dispute, do make, publish, declare, and deliver this my award, or umpirage, in the manner following; that is to say, *first*, I arbitrate, award, judge, order, and determine, that &c. (*here insert the several particulars of the award*) in witness, &c.

An award or umpirage by a single person elected to arbitrate.

To ALL &c. I, E. F. of &c. send greeting; *Whereas*, &c. (*Here go on as in the award made by two arbitrators, until you come to, stand to, &c.*) the award, order, and final determination of me the said E. F. indifferently elected and chosen between the said parties, to arbitrate, &c. (*as in the conditions of the bonds*) so as my said award or umpirage be made in writing, under my hand and seal, and ready to be delivered to the said parties, on or before, &c. as in and by the said in part recited bonds, or obligations, and the conditions thereof may appear. *Now know ye*, that I, the said E. F. (*here go on as in the last precedent*) in witness, &c.

The form of a submission to an arbitration, in order to make it a rule of court.

Be it remembered, that A. B. of &c. and C. D. of &c. being desirous finally to end and determine diverse controversies, suits, and quarrels, that have lately arisen between them, did on &c. agree to submit, and refer all the said controversies, suits, and quarrels to the award and determination of E. F. of &c. and G. H. of &c. arbitrators, for that end indifferently chosen, by the said parties; which said award is to be made in writing, under the hands and seals of the said arbitrators, and ready to be delivered to the said parties, on or before &c. And the said parties did mutually promise and oblige themselves, that they would obey, perform, and execute such award, as the said arbitrators should make in the premises. Now the said parties do farther agree, that the said submission shall be made a rule in his majesty's court of &c. at Westminster, and that they shall be finally concluded by the arbitration that shall be made in the premises by the said arbitrators, pursuant to such submission. *Witness*, &c.

Form of a general release, as part of an award.

Know all men by these presents, that I, A. B. have remised, released, and for ever quit-claimed, and by these presents, do, for me, my heirs, executors, and administrators, remise, release, and for ever quit-claim, unto C. D. his heirs, executors, and administrators, all, and all manner of actions, cause and causes of actions, suits, bills, bonds, writings, obligations, debts, dues, duties, accounts, sum and sums of money, judgments, executions, extents, quarrels, controversies, trespasses, damages, and demands whatsoever, both in law or equity, or otherwise howsoever, which against the said C. D. I ever had, now have, and which I, my heirs, executors, and administrators, shall, or may have, claim, challenge, or demand, for, or by reason, or means of any matter, cause, or thing from the beginning of the world, to the day of the date of these presents. *In witness whereof*, I have hereunto put my hand and seal, and the day of &c.

Sealed and delivered in

the presence of

R. M.

S. E.

A. B.

See ARBITRATION and ARBITRATOR.

AWM, or AUME, a measure of Rhenish wine, containing forty gallons, mentioned in the statute 1 Jac. I. cap. 33. and 12 Car. II. cap. 4. This word is otherwise called *awame*, as may be read in a very old book, viz. "the rood of Rhenish wine of Dordreyght is ten *awames*, and every *awame* is fifty gallons." *Item*, "the rood of Antwerp is fourteen *awames*, and every *awame* is thirty-five gallons." *Cowell, edit. 1727.*

Awm, at present, is considered as a Dutch measure, answering to what is called in England, a tierce, or one seventh of an English ton, and one sixth of a ton of France.

AWNING on board a ship, is when a sail, tarpaulin, &c. are hung over any part of the ship, to keep off the sun, rain, or wind.

AXUNGIA, properly old hogs-lard, but in general old lard, or suet of any other animal. *See FAT.*

AXUNGIA vitri, sandiver, or salt of glass, a kind of salt which separates from the glass, while it is in fusion. It is of an acrimonious and biting taste. The farriers use it for clearing the eyes of horses. It is also used for cleaning the teeth; and it is sometimes applied to running ulcers, a herpes, or the itch, by way of desiccative.

AZIMUTH Compass, an instrument made in a large box, with jambols, and a broad limb, having ninety degrees diagonally divided with an index and thread, to take the sun's amplitude or azimuth, in order to find the difference between the magnetical meridian, and the sun's meridian, which shews the variation of the compass.

Use of the azimuth compass.

1. To find the sun or star's magnetic amplitude.

Turn the whole compass-box to and fro, till each point of the brass compass lies directly above its corresponding point of the compass chard, and let the ship be kept stemming the same point; turn the index towards the sun or star at its rising or setting, till the two threads of the index be in a right line with the object, and that side of the index, corresponding with the center of the instrument, will cut on the brass circle, the degrees, &c. of the object's magnetic amplitude in quantity and quality, which is best counted from the nearest meridian point easterly or westerly.

2. To find the sun or star's magnetic azimuth, or what point of the compass the object is upon, after it is above the horizon.

Turn the whole compass-box to and fro, till the points of the brass compass coincide with those on the compass chard, and let the ship be stemming that point; turn the index towards the objects, till the shadow of the thread fall on the black line of the index, or you see the two threads in a right line with the object; then will that side of the index respecting the center cut on the brass circle, the object's magnetic azimuth. The magnetic azimuth, together with the sun's true azimuth, being found, the variation of the needle may be easily discovered. *See VARIATION.*

AZOGA Ships, are those Spanish ships, commonly called the quicksilver ships, from their carrying quicksilver or mercury to the Spanish West-Indies, in order to facilitate the extracting of the silver out of the mines in Peru and Mexico. But it is a great mistake to imagine, that these ships are absolutely laden with quicksilver only, that being too ponderous a body.

They are not, strictly speaking, to carry any goods, unless for the king of Spain's account; but they are generally full laden, notwithstanding this regulation; by reason that the merchants procure special licences of the king to load, upon paying a consideration for such licences.

Besides quicksilver, these ships carry also fruit and spice for the king's account, and sometimes military stores for the forces in New Spain; as also iron, which is called the king's merchandise.

AZORES Islands, lie in a kind of cluster on the Western or Atlantic Ocean, between thirty-seven and forty degrees of latitude, and twenty-one and twenty-six of longitude, west from London. They are seven in number, besides the two small ones of Flores and Corvo, viz. *St. Michael's Island*, *St. Mary's*, *Tercera*, *Graciosa*, *St. George's*, *Pico*, and *Fayal*. These islands are all allowed to be very fertile in corn, wine, variety of fruits, and to breed great quantities of cattle.

Angra, a city in *Tercera Island*, and the metropolis of the *Azores*, is well built and peopled. It is the only station for ships in all the seven islands; so that it is chiefly for the sake of this port that the Portuguese have been so careful

careful of these islands, and are so shy of letting strangers approach it; its situation being so exceedingly convenient to refresh the ships that sail to, and from Brazil, and other long voyages. In this city are kept the royal magazines for anchors, sails, cables, and other naval stores in general, for the men of war. The maritime affairs are under the inspection of a proper judge, called *desembargador*, who hath other officers under him, and entertains a number of pilots, some to conduct the ships into the harbour, and others to direct them to springs of fresh water, &c. The English, Dutch, and French nations have likewise a consul residing in this city, though their commerce with this, or any other of these islands, is but inconsiderable. The chief commerce of the inhabitants is that of wood, which grows in great plenty in most of these islands, and corn, with other refreshments, which merchant-ships come to take in at this port.

AZOTH, a barbarous name given by Paracelsus to

the *mercurius philosophorum*, that is, quicksilver extracted from any metalline body, which is the proper corporeal mercury. In another sense, *azoth* in Paracelsus, signifies the universal remedy prepared of mercury, the sun, and moon, void of all specific differences, and endowed with a most intense efficacy, and a most general kind of central virtue, including all other remedies in itself; in the same manner as the *substantia prima*, or first substance, includes all the rest, excluding accidents. This Paracelsus was reported to have carried about with him in the pommel of his sword. *Rulandus*.

Azoth is also taken from the liquor of sublimed mercury, (or quicksilver mixed with vitriol and salt, and so sublimed) which is also called *aqua permanens*, *crystallus philosophorum*, *luna physica*, or by whatever other mystical name they please to give it. *Libavius*.

AZURE, a name for a celebrated blue colour, prepared from the *lapis lazuli*, and generally called *ultramarine*. See *ULTRAMARINE*.

B.

B A C

B, the first consonant, and second letter of our and most other alphabets, among the ancients, stood for 300, according to this verse :

Et B trecentum per se retinere videtur.

When it had a small line drawn over it, thus $\overline{B}$, it stood for 3000, and when it had an accent below it, for only 200. Among the Greeks and Hebrews it only signified 2. It is now often used, contracted, for words, as B. A. for bachelor of arts. B. L. for bachelor of laws, &c.

BAAT, in *Siamefe*, and *Tical* in *Chinefe*, is both a weight and coin current in the two empires; the *baat* is of silver, and, as a weight, answers the English half-ounce: it is there four mayons (in *Siamefe* seling) the mayon two fouangs, the fouang four payes, and the paye two clams; here are also sompayes, in value half a fouang. All these weights are also coins, or at least bits of silver that pass in lieu of them, as well in China as in Siam. The *tical* weighs three gros and twenty-three grains, which (reckoning the ounce of silver at three livres and a half *Tournois*) is thirty-two sols and four deniers that money, as it weighs near half an ounce.

The form of the *baat* is square, and as it is subject to great alterations from the wearing down of the angles, strangers should not accept it as a weight or coin, till its value is known.

BACCALAO. See *BARCALAO*.

BACHELOR, those that are called bachelors of the companies of London, are such of each company as are springing towards the estate of those that are employed in council, but as yet are inferiors; for every of the twelve companies consists of a *master*, two *wardens*, the *livery*, (which are assistants in matters of council, or such as the assistants are chosen out of) and the *bachelors*. *Bachelor* was anciently attributed to the admiral of England, if he were under a baron.

BACHIAN. See *Little MOLUCCA Isles*.

BACK-MAKER. This trade, of which there are but few masters, requires chiefly strength, with a little ingenuity. It consists in making liquor-backs, under-backs, coolers, mash-tuns, working-tuns, &c. for the use of the brewers. The workmanship requires some knowledge both in the carpenter's, and the cooper's business. The journeyman work from fix to fix, and have

B A D

about fifteen shillings a week; and the masters require two or three hundred pounds to enable them to make any figure in business.

BACK-STAFF, an instrument in use before Hadley's quadrant, for taking the sun's altitude, and since, when that cannot be afforded. It is generally called *Davis's quadrant*, because it was invented by capt. Davis, and is no other than a common quadrant, lessened in one part of the arch, by supposing it to be divided into two different arches by a concentric circle, whereby the instrument becomes more portable.

BACK-STAYS of a ship. See *STAYS*.

BACON may be imported during the continuance of the act 4 and 5 *Will. and Mar. cap. 5.* 5 and 6 *Will. and Mar. cap. 2. sect. 4.*

BADAGSCHAN, in *Great Tartary*, is a very ancient and extremely strong city; it is not large, but well enough built, and populous; its inhabitants are rich by the gold, silver, and ruby mines in its neighbouring mountains, though none regularly work the mines. Those who live at the foot of the mountains benefit themselves not a little by the grains of gold and silver which they collect in the spring, after the melting snows have washed them from their beds, by their torrents.

BADEN, a county in *Switzerland*, situate between the northern extremities of the cantons of Bern and Zurich, extends on one side where the Aar falls into the Rhine, and on the other side to some villages beyond the Rhine. It is as large as some of the small cantons, has a more fruitful soil, and is watered with three navigable rivers, the Limmat, Rufs, and Aar; bears corn and other fruits, and produces wine in many places along the Limmat. In the mountains from Cappelethof to Endengen are mines of iron.

Baden, its chief town, called *Upper Baden*, is famous for its baths, for which it was celebrated so long since as our Saviour's time, according to Tacitus. The waters are hot in a third degree, being impregnated with much sulphur, with a mixture of allum and nitre. They are good for drinking, as well as bathing, in fevers, phthisics, vertiges, and particularly for disorders incident to the fair sex, and even sterility. Their baths bring a course of people, which is the chief livelihood and business of the town.

Zurzach, about nine miles north of *Baden*, is a fine, ancient, spacious burrough, on the banks of the Rhine, which is remarkable principally for its fairs, on the Monday after Trinity-Sunday, and on the first of September, where very considerable quantities of goods are sold by the merchants of Germany, France, and Italy, in a very short time.

BADGER, (from the French *bagage*, a bundle, and thence is derived *bagagier*, a carrier of goods) signifies with us one that buys corn or victuals in one place, and carries them to another to sell and make profit by them: and such a one is exempted in the *stat. 5* and *6 Edw. VI. cap. 14.* from the punishment of an ingrosser within that statute. But by *5 Eliz. cap. 12.* *badgers* are to be licenced by the justices of peace in the sessions; whose licenses will be in force for one year, and no longer; and the persons to whom granted must enter into recognizance, that they will not by colour of their licences forestall, or do any thing contrary to the statutes made against forestallers, ingrossers, and regrators. If any person shall act as a *badger* without licence, he is to forfeit five pounds, one moiety to the king, and the other to the prosecutor, leviable by warrant from justices of peace, &c.

BADGER, a wild four-footed beast, a little bigger than a fox, to which it bears some resemblance; it has also something of the hog and the dog.

The *badger* dwells in burrows, and lives upon insects, carrion, and fruit. It stinks very much, and grows fat by sleeping, like the dormouse. Its age is known, by the number of holes it has under its tale, a new hole appearing every year.

Though this animal seems not to be of much use in trade, yet it affords three sorts of merchandize. Its skin is of the common peltry, called wild. Its fat is sold by the druggists, and is reckoned good for pains in the loins, and for the sciatica, or hip-gout; and its hair serves to make pencils or brushes for limners and gilders.

BADIAN, or **BADIANE**, is the feed which the anise-tree bears, that grows in China. The tree is thus called, because its wood smells like anise-feed. The Chinese sometimes give their tea an aromatic taste with that feed. Some of the Dutch do the same in the Indies, in imitation of them. In the year 1722, it was sold at Pekin from twelve to fifteen fun per gin, which was reckoned extremely dear, according to the journal of M. Lange, who resided at the court of China.

BAETAS; thus the Spaniards and Portuguese call that sort of woollen stuff, which is not crossed, and which in France is called *baguette*, or *bagette*.

BAFFETAS, a kind of callicoe, fabricated in several parts of the East-Indies; those of Surat have the preference, and are twelve yards in length and one in breadth, but those from the other parts of India differ as much in length and breadth as in quality.

BAG. A great variety of articles in commerce are sold by the *bag*, which means no more than that the *bag* being made of a determinate size, is supposed to contain a certain weight, which is taken in the gross, without weighing for the sake of expedition; but in this case *bags* or *jacks* are generally proved and sealed, or marked under the inspection of the magistracy of the places where they are in use; otherwise they are not to be relied on.

A *bag* of almonds is about three hundred weight, of aniseed from three to four hundred, of pepper from one and a quarter to three hundred, of goats-hair from two to four hundred, of cotton-yarn, from two and a quarter to four and a quarter, &c.

In France, they make *bags* of pistoles, of louis-d'ors, *bags* of a thousand livres, or crowns, *bags* of small pieces of silver coin, &c. Tare is allowed for the *bag*, as five sols per *bag* of 1000 livres.

BAGAVEL. The citizens of Exeter had granted to them by charter of king *Edw. I.* a collection of a certain tribute or toll upon all manner of wares brought to that city to be sold, towards the paving of the streets, repairing of the walls, and maintenance of the city, which was commonly called in old English *bagavel*, *be-~~th~~ugavel*, and *chippinggavel*. *Antiq. of Exeter.*

BAGAUZ. Thus they call in the Antilles Islands the sugar-canes, after they have passed through the mill;

they keep them under cover in small huts, in order to use them, when dry, for boiling the sugar. These huts are called the *bagaux* huts.

BAHAMA, or **LUCAYOS** *Islands*, lie in the Atlantic Ocean, between 21° and 27° of northern latitude, and from 73° to 81° of western longitude, taking their name from one of them called *Babama*, which is situate in the latitude of $26^{\circ} 30'$, at the distance of between twenty and thirty leagues (say some, and fifty leagues, as others assert) from the continent of Florida; but Providence, lying in the midst of them, has been pitched on as the seat of government, when any has been settled here.

These islands were granted by king Charles II. to George, duke of Albemarle, and several other noblemen, who ineffectually endeavoured to people them; for as soon as some adventurers were got there, they were drove off by the French or Spaniards; and when this was not the case, they contumaciously rose against their governors, whom they either destroyed, or sent away prisoners, to the dissolution of all polity, and their own destruction; so that after several settlements made, and successively destroyed, either by the enemy or themselves, these islands became a refuge for pyrates, till 1718, when king George I. appointed a governor, who once more established a colony here, where there may be now upwards of two thousand people; though having a force in these parts, seems more the motive to their settling, than what is expected from their products, for as yet these have been but trifling, consisting in a little tobacco, sugar, &c.

In time of war with any power in these parts, especially with Spain, the *Babama Islands* are of the highest concernment to this kingdom, cruisers and privateers from thence being more capable to obstruct and annoy the Spanish trade homeward-bound, than all that are stationed at the rest of the British colonies in America; and indeed, since the late definitive treaty has annexed Florida to the crown of Great-Britain, and this nation is become mistress of the port of St. Augustine, in the gulph of Florida, these islands will prove of more utility to us than before; for these, together with our new acquisitions of Pensacola, Mobile, and our right of navigation in the Mississippi, will most certainly, in case of any future rupture with Spain, render the whole trade and navigation of the Spaniards far more precarious than ever the same was before in the great gulphs of Mexico as well as Florida, and thereby proportionably diminish the importance of the Havanna itself to Spain; and the Spanish navigation in this part of the world seems now surrounded in such a manner, as to render all our British possessions that are any way contiguous to each other near these gulphs mutually aiding and assisting to each other in case of need.

As the *Babama Islands* are very proper for the reception of small cruisers, not exceeding forty guns; so, if the public service should require larger vessels to be employed in those parts, the harbour of Port-Royal in South-Carolina, on the other side of the gulph of Florida, would be capable of receiving ships of any size or number; and, in concert with those cruisers from the *Babama's*, would prove of greater advantage to this nation than has ever yet been experienced.

Port-Royal, being the southernmost frontier of our possessions on the continent, is likewise so advantageously situated, that ships stationed there, at St. Augustine, and at the *Babama's*, would lie very conveniently, not only to guard our northern colonies, but to assemble a force, if occasion should be, to attack any power in those parts. From hence also, our sugar islands may be more conveniently relieved, and in a much shorter time, than they could by any naval force stationed at Jamaica. And, if the American colonies were put on a proper footing to assist and support each other, a squadron, at this South-Carolina Port-Royal, will always be a check to our neighbouring rivals, and give us a superiority in this part of the world.

The galleons for the Havannah, in their passage through the gulph of Florida, may very easily be intercepted by a squadron stationed at the said port and St. Augustine, assisted by such private advices as the same vessels belonging to Providence may constantly be able to furnish

furnish them with; but there is no instance that the king's ships, stationed at Jamaica, have ever intercepted the galleons or flota in their return home; for they have either had notice from Jamaica before our squadron appeared, or, when they have seen our ships cruising for them, they have lain safe and quiet at the Havannah till the English have been tired out, and retreated through sickness, or for want of provisions, or else have been carried with the stream through the gulph, and then the Spanish fleets have soon followed, and escaped us.

From what has been said, it appears, that the *Bahama Islands* are of far greater consequence to this nation than ever they were before the definitive treaty; and, should they ever become a prey to any other power, they would prove a dangerous annoyance to our trade, and an irreparable loss to the British plantations, as our affairs are at present circumstanced in America.

BAHAR, BAHARE, or BARRE, is a weight used at Ternate, Malacca, Achem, and several other places in the East-Indies. There are two sorts of this weight, the one called the great *bahar*, and the other the small one. By the first, pepper and all other spice is weighed: it is composed of 200 catis; the catis of 26 taels, or $38\frac{1}{2}$ ounces Portuguese, each tael being reckoned $1\frac{1}{2}$ ounce of that weight; so that the *bahar* is 550 lb. of Portugal, or 481 lb. 4 ounces of Paris, Straßburg, Amsterdam, &c. The small *bahar*, by which is weighed quicksilver, vermillion, silk, &c. also consists of 200 catis, but each catis is only 22 taels, or $32\frac{1}{2}$ ounces Portuguese; so that this *bahar* only makes 458 lb. 13 ounces of Portugal, and these near 401 lb. 7 ounces of Paris. With regard to England, the medium weight of the great *bahar* may be said to be 570 lb. and of the small 450.

The *bahar* of China is 300 catis, but these only make 200 of Malacca, each Chinese catis containing no more than 16 taels, one of which weighs $1\frac{1}{2}$ pieces $\frac{5}{8}$ and consists of 10 mafface or mases, and each mas 10 condorins. The *bahar* of Mocha in Arabia weighs 420 lb. containing 15 traffels, the traffel 10 mauns, the maun 40 tuckea, and the tuckea 10 coffila.

BAHAREM, an island in the Persian gulph, seated over-against the coast of Arabia, (from which it is but a little distant) belonging to the king of Persia. The soil is fertile, and produces plenty of fruit, particularly dates, though the water has so bad a taste, that strangers cannot use it, and the divers who frequent this place are obliged to seek it elsewhere. It is not the fertility of the soil, nor the trade carried on here, that renders it so famous in all the East, and obliges the Persians to have a citadel, and to keep a garrison of 300 men here; but the pearl fishery, which is near it, produces at least a million yearly. This fishery begins with June, and ends with September, in which pearls of a large size are sometimes taken, even to the weight of fifty grains, though in common from ten to twelve; and those that exceed this ought to be separated for the king, though herein he has not always justice done him.

BAIL in law, is the setting at liberty one arrested or imprisoned upon an action either civil or criminal, under sureties taken at a day and place assigned; and is either common or special. Common *bail* is in actions of small prejudice, or slight proof, in which case any sureties are taken. Special *bail*, is that given in affairs of consequence, where it is required that the sureties be subsidy men at the least, and according to the matter in question.

BAILE. Thus they stile at Constantinople the ambassador of the republic of Venice, who resides at the Porte.

Besides the political state of affairs with which the Venetian minister is charged, he acts the part of a consul for that republic at Constantinople, and they who are denominated consuls, established in the ports of the Levant, are properly speaking under him, and act as vice-consuls.

BAILEMENT in law, signifies the delivery of things, whether writings or goods, to another; sometimes to the use of him to whom they are delivered; and sometimes to a third person.

BAILIFF, an officer appointed for the administration of justice within a certain district, called a *bailiwick*.

BAILIFF errant, is a person employed by the sheriff to go about the country to execute writs, summon the county sessions, affizes, &c.

BAILIFFS of franchise, are those appointed by every lord to do the same offices within his liberty, as the *bailiffs errant* perform in the county.

BAILIFF is also used to signify a person who takes care of an estate, and directs the husbandmen, gathers rents, appoints the timber to be felled, &c.

Water-BAILIFF, an officer appointed in all port-towns, for the searching of ships, gathering the toll for anchorage, &c. and arresting persons for debt, &c. on the water.

BAILLOQUE, or BAYOQUE. Thus the French call those ostrich-feathers, which are naturally of a dark brown colour, mixed with white. These kind of feathers are seldom dyed, but are generally used by the feather-dealers just as they are plucked from the bird; they only wash them with soap, to give them some gloss, and make them brighter. These *baillouque* feathers are the least valued.

BAIOCO, a copper coin current at Rome, and throughout the whole state of the church. Ten *baicos* make a julio, and a hundred a Roman crown. See COIN.

BAIZE, or BAYS, a sort of coarse open woollen stuff, having a long nap, sometimes frized, and sometimes not. This stuff is without wale, and is wrought on a loom, with two treddles, like flannel. It is chiefly manufactured at Colchester and Bocking in Essex, in the former of which there is a hall, called the Dutch *Bay-hall*, or *Raw-hall*. By the statute 12 Car. II. c. 22. no person shall weave at Colchester any *bay*, known by the names of four-and-fifties, sixty-eighths, eighties, or hundred bays, but, within two days after weaving any such, shall carry it to the Dutch Bay-hall, to be viewed and examined, that it may appear whether it be well and substantially wrought, before it be carried to be scoured and thickened. No scourer or thickener shall receive any such *bay*, before it has been marked or stamped at the said hall. This manufacture, which is very considerable, was first introduced into England with that of *says*, *serges*, &c. by the Flemings; who, being persecuted by the duke of Alva for the sake of religion, fled hither, about the fifth year of queen Elizabeth's reign.

The exportation of *baize* was formerly much more considerable than it is at present, the English then furnishing the French and Italians with those stuffs; but, of late years, the French have attempted to imitate them, and have admirably well succeeded, particularly at Beauvais, Cañres, Montpellier, and Nîmes. They also manufacture vast quantities of *baize* in Flanders, especially at Tournay, Lille, and Neuve Eglises. The export, however, of English *baize* is still very considerable to Spain and Portugal, where they are called *baetas*, and even to Italy. Their chief use is for dressing monks and nuns, and for linings, especially in the army. The looking-glass-makers also use them behind their glasses, to preserve the tin, or quicksilver, and the case-makers to line their cases.

The breadth of *baize* is commonly a yard and a half, a yard and three quarters, or two yards, by forty-two to forty-eight in length. Those of a yard and three quarters are most proper for the Spanish trade.

BAKER. This is a very ancient as well as useful trade; and the most general and extensive branch of it is that of making, as well as baking, household or family bread; though there are several others, as, *biscuit-baking*, which is chiefly to prepare in a particular manner for long keeping what is commonly called sea-biscuit, or bread. *French-bread*, so called for its peculiar delicacy; there are also made various sorts of the nicer sweet, as well as insipid, biscuits, &c. *Ginger-bread*, or sweet-spiced bread, and cakes of several kinds.

Of three these last there but few of each, there not being such a general call for their produce, as for the common bread; the *bakers* of which, indeed, are many in number, yet not so numerous, but that most of them get a decent maintenance, if careful, and some acquire handsome estates. The principal expence they are at, when they set up, is that of building their ovens, one of which will cost twenty pounds and upwards, according to the size; next to this, is their stock of flour and

faggots: so that two or three hundred pounds will serve very well to begin with.

Their employment is even mentioned by Moses (*Gen. xi. 2.*) therefore, in all probability, had its first rise in the East; and they were a brotherhood in England before the year 1155, in the reign of king Henry II. though the *white-bakers* were not incorporated till 1307, by king Edward II. and the *brown-bakers* not till 1621, in king James I's time. Their hall is in Harp-lane, Thames-street; and their court-day on the first Monday of the month.

ARMS. Gules, a balance between three garbs, or; on a chief Barry wavy of six, argent and azure, the hand of justice glorified, and issuing out of clouds proper (holding the said balance) between two anchors of the second.

MOTTO. Praise God for all.

King Henry IV. granted, by charter to the mayor and commonalty of London, the assize of bread, beer, ale, &c. victuals, and things saleable in the said city; which was likewise granted by several other charters of our kings.

The *stat. 51 Hen. III.* was made for regulating the assize of bread, and bakers, not observing the assize, were to be set in the pillory.

By *stat. 8 Ann. c. 18.* The assize of bread is limited, in proportion to the price of wheat, and mayors, &c. may, in the day-time, enter any house, shop, or bake-house, of any baker, or seller of bread, to search for, view, weigh, and try, all or any of the bread, there found; and, if the bread be wanting in the goodness, deficient in baking, under-weight, or shall consist of any sort than what is allowed, the same bread shall be seized and given to the poor: also a penalty of forty shillings is inflicted for want of weight, &c.

By *1 Geo. I. c. 25.* bakers are to pay five shillings for every ounce deficient in weight, and two shillings and sixpence if under an ounce. Bakers selling bread in peck, half-peck, or quartern loaves, at a higher price than set by the lord mayor of London, &c. shall forfeit ten shillings. *Stat. 3 Geo. II. cap. 29.* See BREAD for other penalties concerning the making of it under-weight, deficient in goodness, &c.

The boy, designed for this useful trade, ought to be of an honest disposition, and both strong and industrious; since the apprentices in London are obliged to carry out great loads of bread by day, and to work hard most of the night. The money given with an apprentice is from five to twenty pounds. The journeymen have six or seven shillings a week and their board.

The trade of the *biscuit-baker*, like that of the common *baker*, requires more strength and industry than either learning or ingenuity. The money given with an apprentice is the same as with a common *baker*. The wages given to the journeymen are nearly the same; but the business is more advantageous to a master who has an extensive acquaintance among the masters of ships.

BALAGATE, a kingdom of Asia, in the Indian peninsula on this side the Ganges, makes a part of that of Decan, and produces a quantity of silk and cotton; here also is found excellent lack, as good as that of Pegu, areca, betel, in which the Europeans drive a considerable trade. The diamonds extracted from that which the Portuguese call the old mine, are very much esteemed, especially those to which they have given the name of *naiffez*, or dwarf points, because they are naturally brilliant: here are also amethysts, crysoliths, and those stones which the lapidaries call hematites.

BALAMBOANG. See JAVA.

BALANCE, or the *scales*, one of the six simple powers in mechanics, used principally for determining the equality or difference of weights in heavy bodies, and consequently their masses or quantities of matter.

The *balance* is of two kinds, ancient and modern; the ancient or Roman, called the *statera Romana*, or steel-yard, consists of a lever or beam, moveable on a center, and suspended near one of its extremities; on one side the center are applied the bodies to be weighed, and their weight, measured by the divisions marked on the beam, in a place where a weight moveable along the

beam, being fixed, keeps the *balance* in equilibrio. This is still used in markets, &c. where large bodies are to be weighed.

The modern *balance*, now commonly in use, consists of a lever or beam, suspended exactly by the middle, and a scale suspended at each extremity.

The principle on which each is founded is the same, and may be conceived from what follows:

The axis of a *balance* is that line about which the balance moves, or rather turns round. When we consider the length of the brachia or the beam, then the axis is to be looked upon as a point, and called the center of *balance*. We call points of suspension or application, those points where the weights really are, or from which they hang freely; or the scales in which the weights are placed.

Concerning this machine, we are to observe that the weight does equally press the point of suspension, at whatever height it hangs from it; and in the same manner as if it was fixed at that very point: for the weight at all the heights equally stretches the rope by which it hangs.

This instrument serves to compare together bodies which have equal quantities of matter, though sometimes differing in bulk; for when the commodities to be bought or sold are placed in one scale, so as to make an equilibrium with the weights in the opposite scale, the momenta are equal; and since the velocities are equal on account of the equal distances, the quantities of matter must be also equal.
